humans resembled animals materially but differed by virtue of possessing a soul, reason and language. It was a common task of the science of human nature to account for language 'naturally' by tracing its evolution from onomatopoeic interjections to grammatical abstractions, without recourse to divine interposition or rational direction. While Buffon retained a traditional account of human differentia, Julien Offroy de La Mettrie argued that if animals were machines then, contrary to Descartes, there was no need to withhold that designation from humans. More explicitly Newtonian, David Hartley attempted to provide a physiological foundation for the association of ideas.

Leaving aside Hartley's own particular, ultimately religious, agenda, there is no reason to think Hume would find any incompatibility between that attempt and his own ambitions for a science of human nature; and it is those same ambitions that lie at the roots of contemporary social science.

Humanism

The philosophical term 'humanism' refers to a series of interrelated concepts about the nature, defining characteristics, powers, education and values of human persons. In one sense humanism is a coherent and recognizable philosophical system that advances substantive ontological, epistemological, anthropological, educational, aesthetic, ethical and political claims. In another sense humanism is understood more as a method and a series of loosely connected questions about the nature and character of human persons.

From the fourteenth century to the end of the nineteenth century, humanism minimally meant: (1) an educational programme founded on the classical authors and concentrating on the study of grammar, rhetoric, history, poetry and moral philosophy; (2) a commitment to the perspective, interests and centrality of human persons; (3) a belief in reason and autonomy as foundational aspects of human existence; (4) a belief that reason, scepticism and the scientific method are the only appropriate instruments for discovering truth and structuring the human community; (5) a belief that the foundations for ethics and society are to be found in autonomy and moral equality. From the end of the nineteenth century, humanism has been defined, in addition to the above, by the way in which particular aspects of core humanist belief such as human uniqueness, scientific method, reason and autonomy have been utilized in such philosophical systems as existentialism, Marxism and pragmatism.

1 The problem of humanism

Like other terms that have had parallel careers in philosophy, intellectual history and popular usage (for example, liberalism or idealism), the concept of humanism suffers from an overabundance of definitions such that when considering them together it is not uncommon to ask whether there is anyone who is not a humanist. One can, for instance, define humanism by historical period: classical humanism, Renaissance humanism, Enlightenment humanism. Or one can adopt a definition that links humanism with a particular philosopher or philosophical movement, such as Marxist humanism, Heideggerian humanism or existentialist humanism. Or again one might, like the 1928 *Oxford English Dictionary*, approach the task of defining humanism by its constituent themes or claims: humanism centred on humane virtues like benevolence, humanity - independent persons as opposed to persons conceived within a transcendent divine order - and humane learning as structured within the classical *studia humanitatis*.

In each of these definitional approaches there is a risk of producing an account either so general as to be unhelpful or so particular as to contradict other legitimate usages. Thus, because of the ambiguity and controversy surrounding such terms as 'Renaissance' and 'Enlightenment', it is doubtful whether it helps in defining humanism to speak of Renaissance or Enlightenment humanism. Similarly, to speak of humanism in Pope's sense as 'the proper study of mankind is man' is to bring everything - scientific, non-scientific, religious, anti-religious, for instance - within its orbit. Nor is it apparent that we make any significant gain by talking about Marxist or Christian humanism as if they shared any substantial resemblance. In short, to be helpful, a definition of humanism must be as much alive to what it excludes as to what it includes.

Such an overabundance of definitional signposts, many of them pointing in different directions, suggests that humanism is as much a series of interrelated definitional and methodological questions as of substantive questions about the plausibility of a particular set of philosophical doctrines. This means that perhaps the most coherent understanding of humanism can be found by thinking about it in terms of a series of concentric circles in which the innermost and smallest circle contains the most limited and unproblematic sense of the term, the next and larger circle contains a more comprehensive and contested sense, and the outer and largest circle contains the most recent and controversial usages of the concept (see Figure 1).

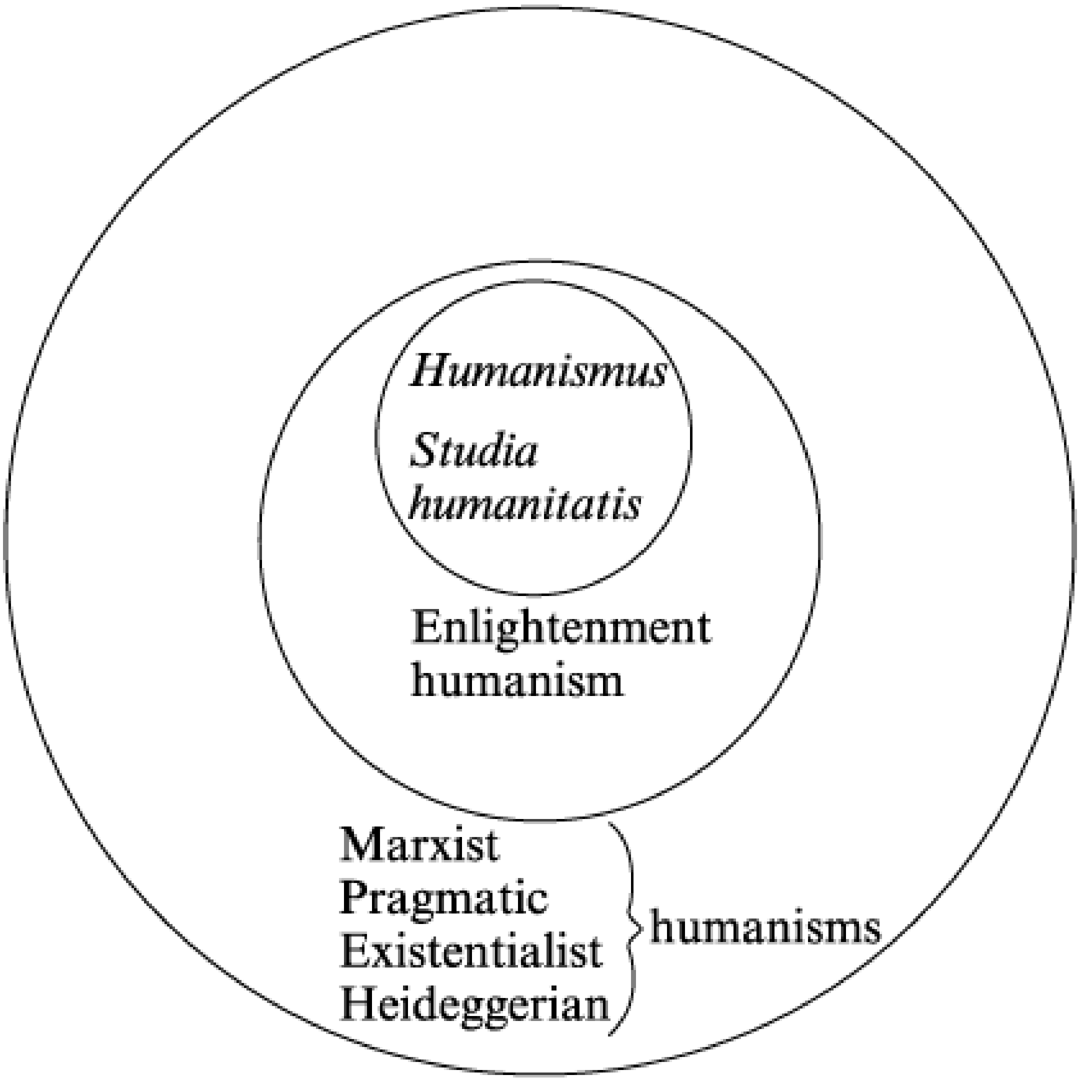

Figure 1

2 *Studia humanitatis*, *Humanista* and *Humanismus*

At the centre of the humanist circle are two definitions, one modern, the other originally ancient and subsequently revived in the Italian Renaissance, both of which define humanism in terms of an educational programme, *studia humanitatis*.

The word ‘Humanismus’ was created to differentiate the classical curriculum of secondary education with its emphasis on Greek and Latin from the modern obsession with scientific, mathematical and practical education. The word was then borrowed by nineteenth century historians (see George Voigt’s 1859 *The Revival of Classical Antiquity* or *The First Century of Humanism*) to describe the educational and cultural programme of a group of Renaissance writers, historians and philosophers, such as Petrarch, Valla, Ficino, and Pomponazzi.

Humanismus is thus derived from *humanista* or humanist, which along with its equivalents in English, French and Italian referred to teachers in schools or universities and students of the humanities. Paul Kristeller (1961: 9) suggested that ‘to judge from its earliest appearance known so far, [the word] seems to have originated in the student slang of the Italian universities, where the professor of the humanities came to be called *umanista*, after the analogy of his colleagues in the older disciplines’. The Renaissance term *Humanista* is itself derived from a more ancient usage *studia humanitatis*, the educational programme of the Greeks and Romans that centred on grammar, rhetoric, history, poetry and moral philosophy. It is important to note that the *studia humanitatis* did not include logic, natural philosophy, metaphysics or mathematics. *Humanismus*, *humanista* and *studia humanitatis* refer not

to some philosophical doctrine but to a broad cultural and educational programme that focused, through close study of the ancients, on the development of elegant writing and speaking.

3 Enlightenment humanism

In the second and wider circle one finds Enlightenment humanism which is closest to the sense that commonly attaches today to the terms ‘secular’ or ‘scientific’ humanism. By Enlightenment humanism one means the men of letters, philosophy and science (for instance, Voltaire, Rousseau, Montesquieu, Diderot, D’Alembert, Locke, Hume, Condorcet and, more problematically, Kant) who lived in the seventeenth and eighteenth centuries and believed that the central concern of human existence was not the discovery of God’s will, but the shaping of human life and society according to reason. For these thinkers, human dignity was not a function of man’s allegedly divine origin, but of the ordering and rational possibilities of earthly existence. The end of persons is neither the immediate adoration of God nor the heavenly city of the blessed, but rather the realization of those projects appropriate to this world, suggested by both reason and imagination.

What drives the project of Enlightenment humanism is the attempt to replace the traditional belief that the concept of a human person makes sense only within the context of talk about created souls, a transcendent, divine order and faith, with the conviction that the idea of persons is correctly to be understood within the context of reason, freedom for self-creation and fundamental scepticism. Enlightenment humanism is at foundation the re-defining of the nature of persons within a conceptual framework of their own making rather than one imposed from the outside. In this sense to speak of Christian humanism seems to be a fundamental contradiction inasmuch as it assumes a prior ontology of divinity within and against which the essence of human persons must be situated. For the Enlightenment humanist there is no such framework, no such transcendent God, no such pre-ordered account of the good life of individual persons or human societies.

To this general focus on the world of self-creating persons must be added a second feature of Enlightenment humanism, namely its conception of reason. Though immensely diverse in both interests and intellectual programme, in substance and nuance, what unites the Enlightenment humanists in a way quite different from either Renaissance humanists or subsequent modern humanism is their enormous confidence in the power of human reason to describe and order the world, and in their ready acceptance of responsibility for the consequences of reason’s ordering.

This confidence and its consequences are frequently caricatured. Enlightenment reason and Enlightenment humanism are often portrayed as cold, passionless, abstract and inappropriately systematic. But this is to mistake the mask for the face. At its core what drives reason for the Enlightenment humanist is passion, a passion for exposing error, for facts based on sound observation and for the coherent ordering of those facts in a fashion that would produce not so much a system as genuine insight into the character of existence even if the product of such insight were not so much illumination as perplexity. As d’Alembert put it in his summation of the eighteenth century ‘ everything has been discussed and analysed, or at least mentioned. The fruit or sequel of this general effervescence of minds has been to cast new light on some matters and new shadows on others’ (1759 (4): 5-6).

Reason, for the Enlightenment humanist, is driven by criticism and scepticism, and if we are to find the most consistent feature of Enlightenment reason it would be its insistence that all claims are falsifiable, and that no one has a privileged position in determining truth by virtue of their authority. For the humanist, sceptical reason thus ensures that all knowledge claims are publicly tested and that no person or institution can claim infallibility. For the Enlightenment humanist the importance of science lies primarily not in its advances in knowledge but in the energy, force and universality of its method.

Reason is central for the Enlightenment humanist not merely because of its critical and sceptical force but equally because of its objective character. Unlike revelation and dogma, which links truth to a particular authoritative person, reason for the humanist acquires its power precisely because the persons advancing knowledge claims are in a crucial sense interchangeable. Reason has the capacity, the humanist argues, to produce a truth that is quite literally subject-free: its claims hold only if they are accessible and make sense to all. Reason in this sense is genuinely emancipatory in at least three ways. First, it liberates individuals from what Kant termed the tutelage of others, the imposed dictates of external authority. Second, it opens up the process of truth to everyone, for truth is not a function of position or perspective. Third, it has the capacity to liberate persons from their own subjectively

imposed prejudices by forcing them to abandon the inadequacy of their merely private viewpoints for the widest, most objective perspective. Reason is thus an instrument of emancipation - it produces not just truth but also autonomy and equality. And it is this connection with autonomy and equality that provides the foundation for the moral and political content of Enlightenment humanism.

As with the Enlightenment humanists' account of reason, so with their conceptions of ethics and politics there is a strong temptation to reduce an enormous diversity and complexity to the simplicity of caricature. Thus some accounts of Enlightenment humanism find within its central tenets sweeping accounts of historical progress, grand schemes for educational reform and radical changes for political institutions. While there are elements of such beliefs and programmes in certain humanists of this period, the general content of humanist ethical and political thought is more restrained.

What emerges most clearly from the humanist emphasis on autonomy and equality is the open, tolerant and diverse character of humanist society. If reason is genuinely the gift of all and if criticism and scepticism and the public search for truth are the task of all, then the number of absolute truths that will structure the social life of society is very small and the circle of those competent to participate actively in the life of running society is very large - humanist reason serves to decrease the amount of societal certainty while increasing the number of qualified members of a political society. Questions of the good personal and collective life are by definition questions that people will solve, as autonomous beings, in different and (in some instances) competing ways. Enlightenment humanism comes closest to agreement in its ethical and political maxims in its commitment to the discipline of reason in which truth must emerge, both publicly and privately, not through dogma but through argument and counter-argument, and in its commitment to the virtues of beneficence and non-malfeasance. In this sense it is not incorrect to claim that much of what today is described as a liberal society - basic liberties, free institutions, diversity and tolerance, the sense, to use Bertrand Russell's phrase, of 'order without authority' - can plausibly be traced to the Enlightenment humanist's conception of reason.

Enlightenment humanism can be approached from any number of directions to come to terms with its intellectual and emotional core: through its compassion for humanity and social reform, through its interest in material and intellectual progress, through its championing of literary freedom, its interest in the classical past, or its belief in the centrality of science and scientific method. At the end, however, its defining characteristic is its confidence in and celebration of human autonomy, an autonomy secure through the critical and creative powers of reason.

4 Modern humanism

There are at least four modern versions of humanism, three of which claim some affinity with the themes of Enlightenment humanism, and one which explicitly disavows any connection with it. These four, Marxist humanism, pragmatic humanism, existentialist humanism and Heideggerian humanism, do not exhaust the humanisms of the modern age, for in popular usage one will frequently find reference to scientific humanism, Christian humanism and secular humanism.

Of the four, pragmatic humanism is closest to the humanism of the Enlightenment (see Pragmatism). Rooted in the American philosophy of pragmatism as developed by Charles Peirce, William James, John Dewey and F.C.S. Schiller, pragmatic humanism shares the Enlightenment humanist concerns for human primacy, the validity of the scientific method and the incompatibility of human dignity with religious belief. While championing the humanist themes of dubitability and scepticism, pragmatic humanism is at odds with Enlightenment humanism on the belief that reason is an unchanging and defining essence of human nature and on the nature of human freedom. Most pragmatic humanists would extend their scepticism to the claim that there is a human essence, and certainly to the belief that reason occupies a privileged place in defining 'humanness'. These humanists would prefer to speak of persons being what they do, with the anthropological emphasis placed squarely on the changing ensemble of environmental conditions that create persons. Similarly, such pragmatists are uncomfortable with the confident Enlightenment talk of human freedom and autonomy, though they do speak of freedom in terms of variation, innovation and foresight.

Closely aligned with pragmatic humanism in its denial of a universal human essence is existentialist humanism, particularly as formulated by J.-P. Sartre in his lecture '*Existentialism is a Humanism*' (1946) (see Existentialism). Inasmuch as 'existence precedes essence', according to Sartre, there is no objective and permanent thing called

human nature. It is nothing else than what persons do, how they choose to act. There is no paradigm of human against which action can be measured. But while concurring with the pragmatic humanists with respect to the essence of human persons, and registering, unlike Enlightenment humanists, a fair degree of scepticism about the capabilities of reason itself, existentialist humanism shares unreservedly in the Enlightenment humanist's celebration of human autonomy. While existentialists like Sartre would allow, at one level, that natural explanations of human actions are appropriate, at another level they would insist that human actions, individual and collective, must be subject to another type of explanation - the explanation of freedom or self-causation. Of the first two types of modern humanism, each has accepted but part of the Enlightenment humanist programme. Whereas pragmatic humanism concurs with the Enlightenment's celebration of human reason but rejects its emphasis on human freedom, existentialist humanism makes human freedom central to its affirmation of humanness but doubts the Enlightenment's emphasis on the primacy of reason.

Any discussion of Marxist humanism labours under the considerable disadvantage of having to come to terms with a complicated variety of Marxes and Marxism (see Marx, K.). Despite this, the general outline of Marxist humanism seems relatively clear with respect to the paradigm of Enlightenment humanism. Although Marx often used the word humanism during 1843-4, it occurs very rarely in his post-1845 works. The reason for this is that Marx came to three insights that subsequently led to his rejection of much of Enlightenment humanism: first, that the development of history is really the constant creation of human nature; second, that if we can speak of a real essence of persons it can be nothing more than the complete ensemble of an individual's social relations; and third, that humanism in the traditional sense is simply another ideology that masks the true nature of social relations by conferring a spurious legitimacy on the status quo. Thus, while accepting Enlightenment humanists' rejection of theism, and their instrumental rationality, Marxist humanism is not prepared to accept their essentialist reading of human nature.

Equally problematic for the Marxist humanist is the Enlightenment's emphasis on individual autonomy, for there is a strong deterministic, or at least inevitabilist element within much Marxist thought. Perhaps the most significant contribution of Marxist humanism, however, is its attempt to give concrete definition to the social ideals that are often only given the vaguest mention in Enlightenment humanism. Apart from its claims about the ideological character of humanism, the unique character of Marxist humanism lies in its practical attention to the Enlightenment's ideas of autonomy and equality.

The other variety of modern humanism is that of Martin Heidegger in his famous *Letter on Humanism* (1947). The letter is a wide-ranging analysis of the humanisms of the past, particularly those of Marx and Sartre. Heidegger's thesis is that traditional humanism (including Enlightenment humanism) in what he calls metaphysical humanism, mistakenly locates human essence in the rational animality of persons, and thus fails to recognize that the genuine source of human essence is in existence, in the human's primordial relationship with Being. Heidegger's rejection of traditional humanism is not based simply on the fact that such rooting of human essence is wrong but that it necessarily corrupts humanism by investing it with a metaphysical character. The goal is thus to 'think the truth of Being at the same time… to think the humanity of *homo humanus*. What counts is *humanitas* in the service of the truth of Being, built without humanism in the metaphysical sense' ([1947] 1977: 21). Heideggerian humanism thus explicitly rejects metaphysical humanism, yet retains both reason and thinking as central to its account of persons and Being. At the same time, however, as this rejection of metaphysical humanism occurs, there is a residual concern for 'meditating and caring, that man be human and not inhumane' ([1947] 1977: 200), in effect an ethical concern, that is surprisingly consistent not only with Enlightenment and every other type of metaphysical humanism, but with every other modern humanism as well.

Humanism, Renaissance

The early nineteenth-century German educator, F.J. Niethammer, coined the word 'humanism', meaning an education based on the Greek and Latin classics. The Renaissance (for our purposes, Europe from about 1350 to about 1650) knew no such term. The Renaissance had, instead, the Latin phrase studia humanitatis *(literally 'the studies of humanity'), best translated 'the humanities'. The Renaissance borrowed the phrase from classical antiquity. Cicero used it a few times, but it was the later grammarian Aulus Gellius who clearly equated the Latin word* humanitas *with Greek* paideia, *that is, with the classical Greek education of liberal learning, especially literature and rhetoric, which was believed to develop the intellectual, moral and aesthetic capacities of a child (*pais *in Greek; hence* paideia*).*

Renaissance humanists understood by studia humanitatis *a cycle of five subjects: grammar, rhetoric, poetry, history and moral philosophy, all based on the Greek and Latin classics. A humanist was an expert in the* studia humanitatis*. The dominant discipline was rhetoric. Eloquence was the highest professional accomplishment of the Renaissance humanists, and rhetorical interests coloured humanists' approach to the other parts of the* studia humanitatis*. The Renaissance humanists were the successors of the medieval rhetorical tradition and the resuscitators of the classical rhetorical tradition. Renaissance humanism was, in the words of P.O. Kristeller, 'a characteristic phase in what may be called the rhetorical tradition in Western culture' ([1955] 1961: 11).*

Renaissance humanism was neither a philosophy nor an ideology. It reflected no fixed position towards religion, the state, or society. Rather it was a cultural movement centred on rhetoric, literature and history. Its leading protagonists held jobs primarily as teachers of grammar and literature. Outside academia, they served as secretaries, ambassadors and bureaucrats. Some were jurists. The Renaissance humanists reasserted the importance of the humanities against the overwhelming dominance of philosophy and science in medieval higher education. As humanism penetrated the wider culture, it was combined with other disciplinary interests and professions so that one found humanist philosophers, physicians, theologians, lawyers, mathematicians and so forth.

Ideologically humanists were a varied lot. Some were pious, some were not. Some were interested in philosophy, most were not. Some became Protestants, others remained Catholic. Some scorned the vernacular while others made important contributions to it. Humanism influenced virtually every aspect of high culture in the West during the Renaissance. Depending on the humanist under discussion, one can legitimately speak of Christian humanism, lay humanism, civic humanism, Aristotelian humanism and other combinations.

Humanism had a profound effect on philosophy. Writing outside the philosophical establishment, humanists sought to make philosophy more literary in presentation and more amenable to rhetorical concerns. No less importantly, they recovered and translated into Latin a large reservoir of Greek classical texts unknown or ignored in the Middle Ages. Platonism, Stoicism, Epicureanism and scepticism all experienced revivals. The humanists challenged medieval Aristotelianism by offering new Latin translations of Aristotle that in some respects amounted to fresh interpretations. They also significantly enriched the Aristotelian corpus by translating the Poetics and the late ancient Greek commentators on Aristotle.

Renaissance humanism arose out of the peculiar social and cultural circumstances of thirteenth-century Italy. It came to maturity in Italy in the fifteenth century and spread to the rest of Europe in the sixteenth. It gradually lost its vitality in the seventeenth and eighteenth centuries as its focus on Latin eloquence became out of date in a world increasingly won over to the vernacular literatures and new science. In the nineteenth century, it did not so much die as become metamorphosed. Renaissance humanism sloughed off its rhetorical impulse and became modern scholarly classicism. Today the word humanism has taken on new connotations, but the heritage of Renaissance humanism runs deep in our culture. As long as we continue to value literature and history, and the functional skills and cultural perspective attached to these disciplines, every educated person by training will be a humanist in the Renaissance sense.

1 Origins

Education reflects the culture that it serves. In antiquity, it was not philosophers and scientists but rhetoricians who

provided the most common form of higher education. Literary-rhetorical training sufficed to qualify one as an educated person. In the cultural disasters that marked the passing of antiquity, monasteries became for a while the main depositories of learning in the West. But in the great medieval resurgence of the eleventh and twelfth centuries, cathedral schools in northern and central France emerged as centres for the education of the clergy. They were, in modern terminology, seminaries. These schools taught the seven liberal arts, a curriculum in which the core subject was grammar and the main reading the classical Latin authors. Thus, at one point in the Middle Ages literary studies constituted, as they had once before in antiquity, the basis of professional education.

Towards the end of the twelfth century, however, the medievals began to find logic and the newly translated Aristotelian corpus, especially the *Physics*, far more valuable (see Aristotelianism, medieval). By the early thirteenth century, a new institution had emerged in northern Europe, the university, where the fundamental faculty was that of arts, and where arts meant the study of Aristotelian logic, philosophy and science. Arts graduates, having received this scientifico-philosophic education, could then proceed to one of the three professional faculties: law, medicine or theology. At no time in Western history have science and philosophy dominated educated culture to the degree they did in the later Middle Ages.

Italy differed from the rest of Europe. North of Rome it was a land not of agrarian feudal principalities, but of city states. Urban interests and urban culture dominated, and the universities differed accordingly from their counterparts elsewhere. Italy’s first university, Bologna, began at the end of the twelfth century as a law school; an arts faculty dominated by the medical faculty quickly followed. The Bolognese two-faculty university became the standard form of Italian universities: in medieval Italian universities the two secular professions of law, with its own faculty, and medicine, within the arts faculty, achieved hegemonic status.

One subject closely connected with law but found in the arts faculty was the *ars dictaminis*, the art of letter writing. This *ars* had emerged in the eleventh century to answer a functional need of the new burgeoning urban society of Italy. The manuals provided instruction on how to write different kinds of letters to different classes of people, along with a generous dose of sample letters, salutations and formulas. The practitioners and teachers of the *ars dictaminis* were the *dictatores*. Their business was eloquence and persuasion. They were medieval rhetoricians, hired by chanceries all over Italy. By the early thirteenth century, *dictatores* were teaching in the arts faculty of the University of Bologna.

Medieval Italy also created another practical form of secular rhetoric, the *ars arengandi*, the art of haranguing. Public speeches played a role not only in politics, but also in a variety of social functions, such as weddings and the awarding of a university degree. In the thirteenth century, Bolognese *dictatores* began to produce model speeches for public occasions; the first extant *artes arengandi* date from the end of the century. Medieval Italy produced a rich literature of *arenge* (secular speeches in Latin) and *dicerie* (secular speeches in Italian). The *ars dictaminis* spread to the rest of Europe, but the *ars arengandi* remained unique to Italy, and in combination with the *ars dictaminis* set medieval Italy apart as the home of a lively culture of secular oratory and rhetoric.

During the thirteenth century, *dictamen* entered into the training of notaries by being linked to the *ars notaria*. The *ars notaria* focused on document writing. Even more than lawyers, notaries gained fame, especially through their skill in composition. Notaries filled the Italian chanceries and the most skilled of them rose to be chancellors of Italian governments and secretaries of popes.

Thus, by the thirteenth century, Italy had a large class of lay professionals associated with law who took a special interest in eloquence and rhetoric. Not by chance, notaries, lawyers and bureaucrats loom inordinately large in the development of medieval Italian literature. The first school of Italian poetry arose in the chancery of Emperor Frederick II (1215-50), one of whose leaders was Giacomo ‘the Notary’. Two of the most eminent Italian poets before Dante were Guittone of Arezzo, chancellor of his home town, and the Bolognese judge Guido Giunicelli. The earliest extant examples of Italian literary prose are the model speeches found in a work of the late thirteenth-century *dictator* Guido Faba. Of the three great fourteenth-century Florentine authors, Dante was a nobleman enrolled in the apothecary guild (see Alighieri, Dante), but Petrarch (see Petrarca, F.) was the son of a notary and was himself trained in law at Bologna, while Boccaccio actually took a law degree.

In the thirteenth century, the Italian rhetorical tradition began to absorb the classicism of the dying cathedral school culture of France. The wellsprings of Latin eloquence, it was believed, lay in the Latin classics.

Commentaries on classical rhetoric that were no longer being copied in France, began to be copied in Italy in the thirteenth century. By the fourteenth century, Italians were writing their own commentaries. *Dictatores*, such Giovanni del Virgilio at Bologna, a correspondent of Dante, began to lecture on classical authors at the universities. Late in the century, the Paduan judge Lovato de'Lovati studied the metre of Seneca and gathered about himself a circle of lawyers interested in classical studies. A younger contemporary, the notary Albertino Mussato became chancellor of Padua and gained eminence because of his Latin histories and epic poem *Ecernis*. In 1315 the Paduans crowned him poet laureate.

This classicization of the medieval Italian rhetorical tradition produced Renaissance humanism. The person who made the movement self-conscious was the Florentine expatriate Petrarch (1304-74).

2 Francis Petrarch

Read today by the general public almost exclusively for his Italian poetry, Petrarch was the greatest classical scholar and Latinist of his time. He was also a cultural icon. Popes at Avignon tried to make him a papal secretary. The republic of Venice furnished him with a free house in the vain hope of acquiring his library. The despots of Parma, Padua and Milan gave him hospitality, and for these princely patrons he several times indited letters and wrote orations in the tradition of the medieval *dictatores*. He had himself crowned poet laureate at Rome in 1337, but not before having the King of Naples 'test' him and give him a diploma (probably written by Petrarch himself) qualifying him as a poet and a historian.

Petrarch promoted the ideal of classical eloquence. The embodiment of that eloquence, he believed, was Cicero. In 1333 Petrarch inaugurated the Renaissance's reappropriation of classical oratory with the discovery at Liège of Cicero's oration *Pro Archia*. In 1345 at Verona he discovered Cicero's *Letters to Atticus*. Petrarch's interests extended to Greek literature. He acquired a Greek codex of Plato's dialogues and another of Homer, though he never learned to read Greek.

Imitating his classical models, Petrarch composed moral treatises and biographies of classical heroes, wrote an introspective dialogue (entitled *The Secret*), produced several collections of his Latin letters, drafted and delivered orations, gained fame as a Latin poet, exposed medieval forgeries of classical documents, and worked on correcting the corrupted texts of classical authors. Petrarch shared the medieval admiration for St Augustine, but reflecting his new cultural perspective, the Augustine he admired was not the theologian but the psychologist and doctor of souls he found in the *Confessiones (Confessions)*.

The contrast between Petrarch's humanist perspective and the philosophico-scientific culture regnant in the universities emerges with special clarity in his invective *De Sui Ipsius et Multorum Ignorantia (On His Own Ignorance and the Ignorance of the Many)* (completed 1371). About 1366, already a cultural icon, Petrarch met four young Venetians who decided, it later transpired, that Petrarch was a good man, but ignorant. If one grants their premise, that learning is defined by the scientific and philosophical interests of the medieval university, then, despite Petrarch's classical learning and literary greatness, the young men were right. In their naïvety, they had accurately drawn the line between humanism and the medieval scientific culture. Petrarch's defence was pretty weak. Apart from using Socratic ignorance as a rhetorical stratagem ('at least I know that I am ignorant'), what he had to say was more a programme than an argument. He denigrated the value of scholastic learning, noted Aristotle's less than dominant position in antiquity, expressed his preference for Plato as being more in harmony with Christianity, and portrayed himself as a true Christian in opposition to the contemporary Aristotelians who worshipped the pagan Aristotle and his Arab commentator Averroes. Petrarch did not even have a name for the outlook he espoused. His successors would remedy this failing and make good his programme (see Petrarca, F.).

3 A name and an image

In the first half of the fifteenth century the new movement had established itself in all the major cultural centres of Italy. Its image-conscious exponents came up with an attractive name for it: the *studia humanitatis* ('the humanities'), and gave its products a new appearance: roman and italic script.

Coluccio Salutati, an Italian notary and a great admirer of Petrarch, was using the phrase *studia humanitatis* as early as the 1360s. Salutati is important because he eventually became the chancellor of Florence and gathered about himself a brilliant circle of younger humanists. The most illustrious were the notaries Leonardo Bruni and

Poggio Bracciolini, who became in turn not only famous humanists, but also chancellors of Florence. Salutati did not identify a fixed set of subjects as constituting ‘the studies of humanity’, but by the 1440s Tommaso Parentucelli (the future Pope Nicholas V) could draw up for Cosimo de’Medici, the political leader of Florence, a plan for an ideal library collection in which he defined the *studia humanitatis* as works of grammar, rhetoric, history, poetry and moral philosophy. These five subjects were in fact those which the humanists taught and on which they wrote with professional competence.

The word *humanista* originated as student slang at the Italian universities in the late fifteenth century as the name of teachers who taught the *studia humanitatis*. No component of the new humanistic programme was in itself new. Ethics was the one part of philosophy which had special relevance to students of literature and rhetoric (see Aristotelianism, Renaissance §7). In the case of history the humanists were innovative in that they were the first to make it an academic subject, not just a literary genre. (Significantly, Petrarch wished to have his diploma qualify him as a historian, not just a poet.) Furthermore, they gave grammar, rhetoric and poetry the quite specific meaning of classical grammar, rhetoric and poetry. The humanists despised medieval Latin. They strove to recover classical Latin and they studied classical Greek. They cultivated neoclassical Latin in their own writings and assiduously imitated classical literary forms. Ironically, a purist humanist would not use the word *humanista* because it was an unclassical neologism.

Along with the name, humanism also acquired a script. Poggio Bracciolini created the new hand in the early fifteenth century under the misconception that in rejecting the angular, densely abbreviated gothic script of the later Middle Ages, he was restoring antique script. He was in fact imitating not Roman manuscripts, but Carolingian manuscripts of the early Middle Ages. Nonetheless, Bracciolini called his creation *littera antiqua*, and we have gone along with his misnomer by calling his new hand ‘roman’. Italic seems to have been the brainchild of Bracciolini’s associate in the Salutati circle Niccolò Niccoli, who sought a cursive version of Bracciolini’s new humanist script. When at the end of the fifteenth century the internationally famous press of Aldo Manuzio began using this humanist cursive in its books, the new script gained the name by which it is known in many languages: ‘italic’. Humanism thus acquired a distinctive look to go along with its propaganda-laden name.

4 Language

Language was at the heart of the humanist movement (see Language, Renaissance philosophy of). Indeed, the distinguishing mark of the humanists was not any philosophy or ideology but their desire for eloquence based on a classicizing Latin. A humanist incapable of writing neoclassical Latin was a contradiction in terms. Humanists enthusiastically revived the classical prose genre of the oration and the letter. They imitated as best they could classical poetic forms such as the epic and the epigram. They composed neoclassical tragedies and comedies. And they wrote manuals of poetics, oratory, history and epistolography with classical models constantly in mind.

Petrarch complained about medieval Latin, but by the early fifteenth century even his Latin no longer met humanist standards. Leonardo Bruni became the new model of contemporary Latin scholarship and others would follow, such as the great philologist Angelo Poliziano (d. 1494) at the end of the century and the Christian humanist Desiderius Erasmus (d. 1536) in the first half of the sixteenth century. Since the humanists took over the teaching of Latin, they achieved near total victory over medieval Latin. Early in the sixteenth century, medieval Latin grammars ceased to be printed. Eventually the only Latin one could learn in the schools was the neoclassical Latin of the humanists. Medieval Latin survives today mainly in specialized vocabulary encountered outside the Latin class, for example, the phrase *a priori* in philosophy, which should be written *a priore* according to classical grammar.

It would be a mistake to think that the humanists collectively were hostile to the vernacular. Some were, but many (starting with Petrarch) wrote in the vernacular as well as in Latin. In the case of Thomas More, his Latin *Utopia* was a far more original work than any of his English writings (see Utopianism), whereas some humanists, such as Pietro Bembo (1470-1547), were actually instrumental in formulating the standards of vernacular literature. Michel de Montaigne, the greatest French author of the second half of the sixteenth century, even had Latin as his first language, because his father would only let him hear Latin until he was old enough to go to school. In general, however, the replacement of Latin by the vernacular as the standard language of literature and learning continued apace in the Renaissance. But even into the eighteenth century, Latin remained an important medium for literary and scientific expression.

Humanist literary values transferred not merely to the vernacular, but also to non-humanistic disciplines. In the Renaissance science and philosophy became more literary in presentation and increasingly vernacular in language. By the mid-seventeenth century, it was hardly scandalous that Galileo published his most substantial scientific works in the form of vernacular dialogues and that Descartes would describe his method of philosophy in a consciously limpid style of French. The *philosophes* of the Enlightenment are in this sense the heirs of the Renaissance humanists, and every academic discipline today presumes at least some minimum literary standard in expository writing.

Petrarch had intuited the importance of Greek for Latin literature. His successors put that intuition into effect. The first decisive moment came in 1397 when the city of Florence hired the Byzantine teacher and sometimes diplomat Manuel Chrysoloras to satisfy the desire of Coluccio Salutati and his circle to learn Greek. Some humanists, such as the famous educator Guarino Veronese, travelled in the other direction to learn Greek by living in Constantinople. Very rapidly in the fifteenth century it was established that excellence as a humanist demanded a thorough knowledge of Greek. Only a minority of humanists ever achieved this ideal, though all praised it. Oddly enough, when other Byzantine scholars followed Chrysoloras to Italy, such as George of Trebizond of Crete about 1416 and Theodore Gaza of Constantinople about 1439, they initially had little impact on Greek learning in Italy. Some of the scholars that arrived after the fall of Constantinople in 1453, especially Johannes Argyropoulos at Florence, did become important cultural forces, but these later Greeks did not shape what had already become a mature humanist movement. They simply served its interests.

5 Learning: the classical heritage

The impulse that drove the humanists to recover the classical languages also drove them to discover lost or unknown classical texts. The Middle Ages had experienced a transformatory infusion of classical texts, but nothing on the scale of the Renaissance revival. Petrarch's discoveries have already been mentioned, but the most spectacularly successful discoverer was Poggio Bracciolini, who in series of forays into German and French libraries during the Council of Constance (1414-7) unearthed a breathtaking number of classical Latin texts. The process of discovery was ongoing from the fourteenth century into the seventeenth century. By the mid-seventeenth century, the Renaissance had recovered the overwhelmingly larger part of the classical literary heritage available now, and in the process had transformed Western learning and literature.

In the case of Latin texts, the humanists essentially discovered manuscripts copied in the early Middle Ages and ignored thereafter. Among their more notable finds were the historians Tacitus and Ammianus Marcellinus as well as new decades of Livy, the poets Catullus and Lucretius, new comedies of Plautus, the architectural authority Vitruvius, the orations, letters and some of the major rhetorical works of Cicero, the complete text of Quintilian, the cookbook of Apicius, the *Astronomicon* of Manilius, the medical author Celsus Cornelius and ten books of the letters of Pliny the Younger.

As varied as these Latin finds were, they pale in comparison to the great mass and riches of the Greek classical heritage exposed by the humanists. Greek texts involved the further difficulty that they had be translated in addition to being found. By the mid-seventeenth century the humanists had put into Latin virtually every Greek text known to them. Some of these translations have remained the only one in any language up to today. Leonardo Bruni, the star pupil of Chrysoloras in Florence, led the way in the first decades of the fifteenth century with his very popular translations of Plato, Aristotle, Demosthenes, Plutarch and St Basil the Great (see Aristotelianism, Renaissance §7; Platonism, Renaissance §§1, 4). His work proved to be only the beginning of a huge expansion of translation from the Greek during the Renaissance.

Translating became, in fact, a major enterprise of the humanists. As classroom teachers they focused on the humanities, but as translators and classical scholars they took in the whole of the Christian as well as pagan classical heritage. They recovered and translated for the first time not only works by the Greek orators, dramatists, historians, poets, rhetoricians, literary critics (including the *Poetics* of Aristotle) and essayists, but also the Greek mathematicians, astronomers, geographers, philosophical writers (especially Plato, Plotinus, Sextus Empiricus and the commentators on Aristotle), medical authors and military tacticians. They retranslated virtually every Greek scientific and philosophical text known in the Middle Ages, including Aristotle. They also set about finding and translating the vast number of writings left by the Greek church fathers, retranslating the Bible itself and

publishing it in its original languages. The humanists created a patristic and biblical renaissance in addition to a pagan literary renaissance.

Before the West could surpass antiquity, it had to know and make available what the ancients knew and did. Bringing that about in literature, science, philosophy and theology was one of the great achievements of the Renaissance humanists (see Aristotelianism, Renaissance; Platonism, Renaissance).

6 Learning: philology

The humanists did much more than introduce classical texts: they came to understand them better. They could do so, first, because of their superior knowledge of classical history and languages. The first landmark work in this regard was Lorenzo Valla's *Elegantiae Linguae Latinae (The Fine Points of the Latin Language)* completed in the 1440s, where Valla taught the West to understand many of the words, idioms, phrases and grammatical constructions of classical Latin correctly(see Valla, Lorenzo §1). Second, the humanists began to become professionally concerned with the emendation of texts. The key event here was the printing press.

Before printing, the reproduction of a text meant copying. Any substantial copying invariably corrupted the text and, were copying to be repeated often enough or carelessly enough, such corruption could become serious indeed. The early humanists were acutely aware of the need to emend the classical texts they cherished. Petrarch and Valla, for instance, attempted to emend the text of Livy. In the 1440s at Naples, Valla even became involved in a quarrel with other humanists concerning the emendation of Livy.

The introduction of printing into Italy in the late 1460s transformed this situation. Whereas every manuscript copy of a text was different from every other, every copy of a printed edition was at least theoretically identical with every other. Humanists quickly became editors and correctors of classical texts for the new presses. They also began to argue furiously about the principles and practice of textual emendation. One humanist, Niccolò Perotti, at Rome in 1470, even urged the pope to censure the printing of books not for the purposes of religion but for the purpose of maintaining quality control in the reproduction of classical texts.

Humanists had found a new professional outlet; they had become philologists, the editors and correctors of texts. The most sophisticated of them early on was Angelo Poliziano (1454-94), whose *Miscellanea* summed up many of the principles developed by previous humanists (for example, going back to the Greek models of Latin texts, understanding the linguistic habits of an author, and seeking out the oldest manuscripts) and added some new ones (including the need to understand the genealogy of a manuscript and historical sources, and the need to cite sources precisely).

Lorenzo Valla provided a prime example of how this emerging philological sophistication could be put to use for more than purely grammatical purposes. In his clamorous *Oratio de falso credita et ementita Constantini Donatione (Oration on the Falsely Believed and Fabricated Donation of Constantine)* of 1440, he investigated the authenticity of a document that had been cited for centuries to prove that the Emperor Constantine gave the whole western half of the empire to the papacy. Using linguistic, historical and numismatic evidence Valla proved that it was in fact a medieval forgery. This sort of historical and philological knowledge had a wide application. In law it meant a reinterpretation of Justinian's *Corpus Iuris Civilis*, which had served as the basic text of secular law in the universities. The medieval commentators had frequently made the *Corpus* applicable to the new society of medieval Europe by interpreting it anachronistically. The new historical methods of the humanists totally undermined this medieval approach. Ironically, the humanist historical understanding of the *Corpus* failed to take hold in Italy, where the traditionalists, called the Bartolists (after the famous medieval jurist Bartolo of Sassoferrato), were able to retain control of the law faculties. Instead the Italian historico-philological approach to law received the name *mos Gallicus* ('the French custom') because it was the sixteenth-century French jurists who appropriated it and took the lead in applying it.

The new humanist philology had an even greater impact on religion. The Italian humanists translated many Greek church fathers, especially under the influence of Pope Nicholas V (1447-55), formerly Tommaso Parentucelli (see §3). The Florentine businessman turned humanist Gianozzo Manetti (d. 1459) made a fresh translation of the New Testament from the Greek and the Psalms from the Hebrew. In the 1440s, Lorenzo Valla prepared a comparison of the Greek text of the New Testament with the current Latin translation, called the Vulgate, and found the latter faulty in hundreds of places. Manetti's and Valla's work had little resonance in Italy because as a group Italian

humanists took no professional interest in theology. In the sixteenth century, however, the discovery of Valla's *Annotationes in Novum Testamentum (Annotations on the New Testament)* inspired the humanist religious reformer Desiderius Erasmus (§6) of Rotterdam to become a scripture scholar, and in 1516 he published the first printed Greek edition of the New Testament. He also made a new Latin translation and wrote a commentary where he drew theological conclusions from his philological and historical understanding of the Greek text. Humanist philology when applied to religion had resulted in scriptural theology. Humanists now clearly had a professional role to play in theology alongside the traditional doctrinal theologists.

Erasmus' timing could not have been better. The year after his edition, the appearance of Luther's Ninety-Five Theses ushered in the Reformation. Protestants made Scripture the sole source of religious authority. Martin Luther was in many ways a very traditional dogmatic theologian, but he learned Greek and translated the New Testament into German from Erasmus' edition. Henceforth humanist philological knowledge was necessary in any serious treatment of the text of Scripture on the Catholic as well as the Protestant side of the struggle. Moreover, since both sides claimed continuity with the early church and wished to harness to their positions the authority of the church fathers, the historical and linguistic expertise of the humanists became all the more crucial to official religion, as reflected in not only biblical scholarship, but also the myriad editions of the church fathers and the monumental cooperative historical projects, such as *The Magdeburg Centuries* of the Protestants and the *Acta Sanctorum* of Jean Bolland and his fellow Jesuits.

Philosophy also began to blend with humanism, most notably with regard to Platonism. As we have seen, Petrarch expressed preference for Plato. Leonardo Bruni considered himself an Aristotelian, but his translation of some of Plato's dialogues inaugurated the Renaissance reception of Plato. The process culminated in the great Renaissance Platonist Marsilio Ficino who combined competence in Greek and humanist literary interests with the profession of a philosopher. Only such a combination allowed Ficino to make Platonism a powerful element in Renaissance philosophy. Similarly, the humanistically trained Gianfrancesco Pico della Mirandola was able to introduce classical scepticism into Renaissance philosophical discourse because his anti-Aristotelian *Examen vanitatis doctrinae gentium (An Examination of the Emptiness of Pagan Learning)* of 1520 incorporated large tracts of the then still untranslated works of Sextus Empiricus. The humanists Cosma Raimondi and Lorenzo Valla became the chief proponents of Epicureanism in the fifteenth century.

Humanism combined less significantly with Aristotelianism (see Aristotelianism, Renaissance; Logic, Renaissance §3). Early on, several important humanists, such as Leonardo Bruni, George of Trebizond, and Theodore Gaza, were avowed Aristotelians. Bruni and Gaza consciously strove to replace in their translations the traditional terminology of medieval Aristotelianism. By the early sixteenth century one of the leading traditional Aristotelians in Italy, Agostino Nifo, thought it necessary to learn Greek. By the later sixteenth century humanistic Aristotelianism had become a powerful force, as documented by the popularity of the bilingual Aristotelian editions of Giulio Pace (1550-1635) and most of all by the bilingual editions and commentaries of the Jesuits of the Portuguese University of Coimbra (see Collegium Conimbricense).

7 Evolution of humanism

Different humanists had different interests and served different masters. Petrarch at times did the bidding of tyrants and sang the praises of the solitary life. In fifteenth-century Italy, the tyrants, popes and Aragonese kings of southern Italy had large numbers of humanists serving them. So did the republics of Florence and Venice. Leonardo Bruni, even before he became chancellor of Florence, glorified participation in the republic and has been hailed in more recent times as the founder of civic humanism (a brand of humanism that stressed republican values). Some humanists, such as Giannozzo Manetti, Bartolomeo Fazio and Erasmus emphasized the moral freedom of humans while others, such as Coluccio Salutati, Lorenzo Valla and all Lutheran humanists denied or severely limited the range of human free will. The Aristotelian George of Trebizond launched a crusade against Platonism at Rome in the 1450s and 1460s on the eve of the emergence of Florentine Platonism under Marsilio Ficino. Petrarch and Valla attacked medieval Aristotelianism in order, they said, to defend Christianity. Most Italian humanists, on the other hand, did not involve themselves with theology. Starting in the early sixteenth century, under the leadership of Erasmus, Christian humanism became a potent force for religious reform. In the religious crisis of the sixteenth century, humanists could be found on all sides of the theological arguments. Eventually Catholics as well as the major Protestant churches made humanism the basis of their respective

educational curricula. Humanists vented their fury on matters of Latin style. Some, such as George of Trebizond, Paolo Cortese, Pietro Bembo and the Jesuit schoolmasters insisted on the imitation of Cicero. Others, such as Angelo Poliziano, Erasmus and Petrus Ramus (§2) bitterly opposed the Ciceronians and called for an eclectic approach to imitation. Other models were also proposed: Valla favoured Quintilian, Cortese towards the end of his life converted to the imitation of Apuleius, and late in the sixteenth century Justus Lipsius popularized the imitation of Seneca. In short, apart from their commitment to Latin eloquence and classical literature, Renaissance humanists could differ considerably on philosophical, religious and cultural issues.

The people involved with humanism also changed over time. As the fifteenth century advanced, the link between notaries and humanists in Italy faded with the humanists becoming a distinct group of educated professionals, mainly occupied with teaching. The prototypical fifteenth-century Italian Renaissance educators had been Vittorino da Feltre and Guarino Veronese who ran humanist schools for the princely courts of Mantua and Ferrara respectively. But humanists also made careers in secular governments and the church. A few were businessmen, such as Niccolò Niccoli (d. 1437), a great collector of books. After Niccoli's death, Cosimo de'Medici took control of his library (in return for paying his debts) and made it the nucleus of the first public library since antiquity, the Biblioteca Laurenziana in Florence. Some humanists were even businessmen, such as Aldo Manuzio, whose printing press at Venice from the 1490s onwards became famous for its editions of the Greek and Latin classics. The Aldine Press remains today the best-known publishing house of the Renaissance.

Almost all humanists were men, but some women were also involved. The first female humanist of importance was Isotta Nogarola (1418-66), a noblewoman of Verona, whose Latin writings fill two volumes in their modern edition. At the other end of the chronological and geographical spectrum the pious Dutchwoman Anna Maria van Schurman (1607-78) was significant; she was best known for her treatise defending the education of women and extraordinary for her command of languages (Latin, Greek, Hebrew, Aramaic, Syrian, Arabic, Turkish, Ethiopian, Dutch, Spanish and English). The problem for women in the Renaissance was that they were denied access to the universities and learned professions.

Towards the end of the fifteenth century humanism began to penetrate northern Europe, which differed from Italy in some important respects. The north lacked Italy's tradition of secular oratory, and its universities were more involved in preparing students for a clerical career than those of Italy. Consequently, though northern Europe had its share of secular-minded humanists, it is no accident that Christian humanism became a movement first in the north and that the first humanist manuals for sacred oratory emanated from northern humanists. As in Italy, the vast majority of northern humanists were by profession teachers, along with a significant number of lawyers (including Thomas More), diplomats, bureaucrats and clergymen.

In the course of the sixteenth century a revolution took place in education (see Melanchthon, P.). The Jesuit colleges and the Protestant academies established a system of secondary schools, unknown to the Middle Ages. The basis of these new schools was the humanist curriculum. They were popular because they worked. Their students were better prepared for the university than those students who did not attend them. By the mid-seventeenth century, the victory of humanism was virtually complete. To be educated meant that one had received along the way a humanistic education.

That victory cost Renaissance humanism dearly. The humanists had captured the grammar schools and the new secondary schools and lost the universities. By the mid-seventeenth century, humanists had come to be mainly primary and secondary school teachers. In Catholic countries, for lay humanists even this career path was limited by the Jesuit colleges. Furthermore, in a world where the language of learning and letters had become the vernacular and where science and philosophy had left behind the classical systems, Renaissance humanist education appeared increasingly irrelevant and provoked calls for educational reform. Paradoxically, this turn away from Renaissance humanism proved liberating. In the nineteenth century, humanism was able to slough off its Renaissance rhetorical mission and become instead a training in culture and taste. The educated public rediscovered antiquity as a source of aesthetic and cultural values. No less importantly, the new humanist became a scientific discoverer, that is, the university professor opening up new frontiers of knowledge. The new humanism emanating from Germany had its own professional education, scientific methods and prestigious *cursus honoris*. Humanism once again took the lead in innovative learning. It engendered the research seminar and made research the standard for promotion within higher education. Indeed, as humanism became scientific classicism, it showed

the way for the vernacular literatures and the arts to become in their own right academic subjects at all levels of education. The Renaissance *studia humanitatis* had evolved into the modern humanities.

Humboldt, Wilhelm von (1767-1835)

Along with Schiller and Goethe, Humboldt was one of the chief representatives of Weimar classicism, a movement that aspired to revive German culture along the lines of ancient Greece. Humboldt's philosophical significance resides mainly in two areas: political theory and the philosophy of language. In political theory he was one of the founders of modern liberalism; and in the philosophy of language, he was among the first to stress the importance of language for thought, and of culture for language.

Born into an aristocratic family in Prussia, Humboldt received a private education by some luminaries of the Berlin Enlightenment (see Enlightenment, Continental). As a young man he frequented the literary salons of Rahel Levin and Henriette Herz, where he cavorted with some of the leaders of the Romantic movement. Humboldt spent much of his career in the service of the Prussian state. From 1802 to 1810 he was the Minister of Education in the Prussian Reform Administration of Baron von Stein; and from 1813 to 1815 he acted as Prussian representative at the Congresses of Prague and Vienna. His most important achievements were as Minister of Education. In this role he founded the University of Berlin, and created the first unified school system in Germany, whose broad outlines still exist.

Like Kant,F.H. Jacobi and Georg Forster, Humboldt was one of the founders of German liberalism. His *Ideen zu einem Versuch, die Gränzen der Wirksamkeit des Staats zu bestimmen (The Limits of State Action)*, which was written in 1792 but not published until 1851, later became a classic of the liberal cause. Strictly speaking, it is anachronistic to regard Humboldt as a spokesman for liberalism, given that liberalism was not a self-conscious and organized movement in Germany until the 1840s. Nevertheless, his ideas proved influential for later liberals. The *Ideen* inspired much of J.S. Mill's *On Liberty* and Edouard Laboulaye's *L'État et ses limites (The State and Its Limits)*.

The distinguishing feature of Humboldt's liberalism is its humanism, its ethic of perfection, the development of individuality (*Eigentümlichkeit*) and wholeness. Humboldt contended that the main aim of the state should not be to promote happiness, but excellence or individuality. The central argument of the *Ideen* is that the best state to achieve this end is the minimal one that permits everyone to do whatever they want, as long as they do not interfere with a similar liberty for others. Since the chief condition of individuality and excellence is freedom of choice, the best state is the smallest.

It is important not to confuse Humboldt's view with other doctrines later associated with liberalism. Unlike most German liberals of the 1840s, Humboldt had little sympathy for democracy, and held that the best government for the protection of liberty is a constitutional monarchy. Although Humboldt approved of a market economy, his liberalism was also not a defence of *laissez-faire*. He deplored the doctrine that the main aim of the state should be to create wealth or prosperity, for he feared that such materialism undermined the pursuit of excellence. Finally, unlike later liberalism,Humboldt's individualism was not at the expense of communal values, because he insisted that people develop their powers only through cooperation with others.

Humboldt's role in the development of the modern philosophy of language has been the subject of dispute. It is too much to claim that he is 'the father of modern linguistics' (Ernst Cassirer), since this ignores the many earlier contributions to this field (F. Bopp, J. Degerando, E. Condillac, F. Schlegel andJ. Herder). Humboldt's philosophy synthesized, however, many of the most advanced ideas on the nature of language in the early nineteenth century. At the very least,Humboldt was one of the leading figures behind the development of comparative linguistics, the detailed study of the different forms of language.

The characteristic conception behind Humboldt's theory is his view of language as an organism. Like many early nineteenth-century thinkers, Humboldt believed that human activities are best explained in organic rather than mechanical terms. He held that language, like any organism, is an indivisible whole. It is a whole in two respects: the main unit of meaning is not the word but the sentence; and each language is unique, having a distinctive meaning that cannot be completely translated into another language. Humboldt also maintained that, like any living thing, language is dynamic. We cannot understand it simply as a static collection of rules and words, because it is an activity, the attempt to express thoughts in symbols. Because it is an activity, language is

constantly evolving and changing.

Rejecting the older rationalist view that words are only arbitrary symbols to designate already fixed concepts, Humboldt stressed the unity of thought and language. He insisted that we discover, define and develop our concepts only through words. Thinking consists in a dynamic interchange between words and concepts. After expressing an idea in a sign, that sign takes on an existence of its own that also partially determines the shape of our ideas. Both concept and sign shape each other until there is at least an approximate correspondence between them.

Humboldt also emphasized the cultural dimension of language. Each language is a unique form of thought, expressing the whole way of life of a people. This view led him to a doctrine of linguistic relativity, which he never fully explored. According to this doctrine, there are as many ways of thinking about the world as there are cultures.

The most controversial aspect of Humboldt's philosophy of language is his typology, which evaluates languages according to the degree that their matter is subordinate to form. He imagined a hierarchy beginning with the purely agglutinative languages, where matter dominates form, and ending with the inflected languages, where form subjugates matter. Such a typology, however, presupposes that there is some ideal or universal language, which is incompatible with the cultural dimension of language. It also clashes with two facts: that some peoples who have an agglutinative language have a highly developed culture (the Chinese); and that some inflected languages, such as English, tend to become formless by losing their endings. Humboldt attempted to meet these difficulties by revising and refining his typology. In the end, however, he never perfected his theory, which remains scattered in many unfinished writings spanning several decades.

Hume, David (1711-76)

Hume's philosophy has often been treated as the culmination of the empiricist tradition of Locke and Berkeley, but it can also be seen to continue the sceptical tradition, and, even more strikingly, the naturalist tradition of Epicurus, Lucretius, Hobbes and Spinoza. Hume challenges orthodox religious conceptions of human nature. He presents us as part of a larger nature, sharing our basic cognitive and affective capacities with the higher animals. Our 'reason' is not some God-given privileged access to truth, but simply our language-affected variant of 'reason in animals'. The negative, anti-rationalist arguments of his first work, A Treatise of Human Nature, where he attacks the views of theistic rationalists, are more muted in his later writings, but the anti-religious arguments become ever more explicit. The importance of his philosophy lies in the thoroughness of his naturalistic project. He tries to show that neither knowledge nor ethics nor the political order needs any sort of religious foundations, and also to explain why so many thinkers had mistakenly held that they did.

To the end of his life Hume called himself a sceptic, but his scepticism was in the service of his secular reform of culture, and always 'mitigated' by his recognition that a 'true sceptic' would be as diffident of his doubts as of his convictions. Sceptical arguments are found useful, however, to cut down the pretensions of dogmatic religious and rationalist claims. His essay 'The Sceptic', although purporting only to portray one sort of philosopher, is often read as a self-portrait.

His first and now most famous work, his Treatise, was 'of human nature'*, which he takes to include our understanding, our passions, and what drives our moral and political life. Much of Book I of the Treatise, 'Of the Understanding', is devoted to showing how many of our beliefs are owing to our 'imagination', rather than to our 'reason'. Book II analyses our passions, their foundation in pleasure and pain, their various idea 'causes' and 'objects', and their communication by sympathy. One of its most famous claims is that passions are needed to motivate action. Hume, whose project is similar to that of Hobbes in Human Nature or the Fundamental Elements of Policy, follows him in taking will to be simply the transition from belief-informed passions to action, and takes voluntary human action to be in principle predictable, like everything else. Book III examines our moral evaluations of actions and passions.*

In the Abstract of the Treatise Hume underscores the importance of psychological association in our passions, our belief formation, and, more generally, in the workings of our imagination. Where John Locke and Francis Hutcheson had found associative thinking a disease of the mind, Hume makes it the norm. Association of ideas by 'resemblance', by temporal and spatial 'contiguity', and by 'causation' gently guides our minds in our spontaneous thinking and fantasizing, and association by causation guides us less gently in our inferences. Like Locke, Hume takes it for granted that 'anatomists' will have some explanation, say in terms of our nervous system and the physical proximity of memory traces in the brain, to account for the psychological phenomena.

Hume emphasizes the influence of experienced repetition on our beliefs and our passions. His famous account of causal inference, which Immanuel Kant claimed woke him from his 'dogmatic slumber', makes it the more or less instinctive extrapolation into the future of regularities and frequencies that have been experienced in the past, along with a tendency to project the felt 'determination of the mind', in its causal inferences, onto the subject matter of those inferences, giving us the idea of causal necessity. Even when made explicit in language, our causal inferences cannot be made into 'demonstrations', in which the conclusion follows with logical necessity from premises known to be true. Hume is credited with discovering 'the problem of induction', although Pascal may have helped in that discovery. Problematic or not, induction is relied on in Hume's own account of our nature. Indeed he believed that, unless we did rely on it in ordinary life, we would 'perish and go to ruin'.

Hume's general theory of human nature, and of the basic capacities and passions which we share with other mammals, is put to work in his account of what is distinctive to us, namely morality, religion, art, politics, and criticism. Like Shaftesbury and Hutcheson before him, he takes morality to involve a special pleasure taken in some human character traits. As moral judges, we find various character traits pleasing and displeasing, and we evaluate forms of social, cultural, and political organization which express or encourage such traits. Our moral sense is a reflexive form of our more basic capacity to take pleasure and displeasure in a range of different things. Morality, as Hume analyses it, is in no way dependent on that other distinctively human phenomenon, religion.

In his writings on religion he gave great offence to believers of his day, both by his diagnosis of the causes of religious fervour, and by his claims about its 'pernicious' effects. Like Pascal, he saw the basic cause of religion to lie in our anxiety about our own fate, but unlike him, did not endorse the religious response to this anxiety. Our ability to think about the future, combined with the limits of our success in finding natural causes for events that affect our happiness, and the intensity of our concern for that, lead us to postulate gods, invisible intelligent causal forces, super-persons, whom we try to please and placate by our prayers and devotions. Different religions and different forms of monotheism naturally develop, and religious persecution and religious wars are the result.

This entirely naturalistic account of reason, morality, politics, culture, and religion made Hume a hero for later Darwinians, such as Huxley, and the toast of the free-thinking Paris salons of his day. But in Britain, despite the fact that his political views are often taken to be conservative, his views on religion were seen by his contemporaries as dangerously radical, as an attack on the very foundations of his own culture.

1 Life and reputation

Hume was born in Edinburgh on 26 April 1711. He left us his own brief account of his life, where he highlights the 'good family' he came from (lawyers and landowners on both sides of the family), his 'slender' patrimony from his father, Joseph Home of Ninewells, who died in his infancy, the devotion of his mother, Katherine Falconer, to her three children, his own disinclination to study law, as was thought suitable for him as younger son, and his life-long 'passion for literature'.

After study at Edinburgh University, and beginning the study of law, he began working on what became the *Treatise of Human Nature* while living at Ninewells (Chirnside, near Berwick, Scotland) with his mother, brother and sister. His mother's only recorded comment about her famous son, 'Our Davie is a fine gude-natured crater [creature], but uncommon wake-minded [weak-minded, or weak of will]', may have its explanation in his failure to stick to his law studies. He left home in 1734 and completed the *Treatise* in La Flèche, 'a country retreat' in France, where he had the use of the library of the Jesuit college (where Descartes had been educated), and could try out his arguments about miracles on the priests. The book was published in London in 1739-40, and Hume was bitterly disappointed by its reception. He published essays during the next few years, and his *Essays Concerning Human Understanding*, (later the *Enquiry Concerning Human Understanding*), which restates some themes of the *Treatise*, in 1748. He had written to his friend Francis Hutcheson that the *Treatise* would offend the religious, but he still seems to have been dismayed when the offence it gave ruled him out as an applicant for the chair of Moral Philosophy at Edinburgh University in 1745. His radical views also cost him the Chair of Logic at Glasgow; the only teaching position he ever held was as tutor to a mad English nobleman, for one year, 1745-6. Later he served as a military and diplomatic secretary, as librarian to the Advocates' Library in Edinburgh (while he was working on his *History of England*), and as an Undersecretary of State in London, 1767-9. As Secretary to the British Ambassador in Paris, 1763-6, he met many French intellectuals and earned the title 'le bon David'. On his return journey he escorted Rousseau to England to escape persecution in France and Switzerland. This brief acquaintance ended in a famous falling out.

During the 1750s he had published the *Enquiry Concerning the Principles of Morals*, which Hume believed was his best work, the *Political Discourses*, and the *Four Dissertations* (containing his controversial *Natural History of Religion*), as well as volumes of his *History of England*. It was chiefly as a historian and essayist that he achieved fame in his lifetime. In 1769 he retired to Edinburgh, built a house in the new St Andrews Square, and could live 'opulently' on his earnings. He never married, but had several close friendships with women, and took a great interest in the education of the children of his older brother and of some of his friends. He and his sister entertained a large circle of Scottish friends (including Adam Smith, the architects Robert and James Adam, William Robertson, Adam Ferguson, Hugh Blair, and many ministers of the Church of Scotland), and occasional guests from overseas, such as Benjamin Franklin, who stayed with Hume for a month. Until his death in 1776 Hume continued adding corrections to new editions of his published writings and polishing his *Dialogues Concerning Natural Religion*, published posthumously in 1779. As he was dying he was visited by James Boswell, curious to find out if, when death was close at hand, the 'great infidel' could preserve his calm Epicurean acceptance of the view that death was annihilation. (His publisher, William Strahan, also expressed the same curiosity in a letter.) Hume joked with Boswell about death and the possibility of an afterlife, and then changed the subject to recommend that Boswell read Smith's *Wealth of Nations*. Boswell left 'with impressions which disturbed me for

some time'.

Hume continued to disturb the religious from the grave. Leslie Stephen, writing in 1876, remarked that Hume's writings were so subversive to religion that the general reluctance to face up to their arguments had led to a neglect of his philosophy. However Thomas Reid and Immanuel Kant had not neglected it, and nor had Jeremy Bentham and John Stuart Mill. T.H. Huxley saw Hume as an ally in the cause of a naturalistic science of human nature, and even T.H. Green, who found in his philosophy little except an object lesson in the errors of subjectivism and empiricism, did him the valuable service of re-editing his writings.

To his first biographer, T.E. Richie, Hume was a great historian who had dabbled in philosophy in his youth. For much of the twentieth century he was seen as a great sceptical philosopher who, having shown how little philosophy could hope to do, turned away from philosophy and passed his time writing a sort of '1066 and all that'. Increasingly he is coming to be seen as a scientist of human nature whose 'science' included studying the origins and development of his own culture. His *History* is found to be interestingly philosophical, his philosophy from the start to have been intent on 'a cautious observation of human life …men's behaviour in company, in affairs, and in their pleasures' (*Treatise*: xix). The sceptical strain in his thought, especially when combined with his ambitions as a scientist of human nature, continues to fascinate commentators. Increasing attention is being paid to Hume's essays and later work, and to their relationship to his earlier more 'abstruse' writings.

Strahan, in a letter to Hume's nephew who was arranging the posthumous publication of the *Dialogues Concerning Natural Religion*, wrote that this long-delayed publication 'will probably make some noise in the world; and its tendency be considered in different lights by different men'. Not only the *Dialogues*, but the entire corpus of Hume's writings continues to make some noise in the world, and the tendency of his thought continues to be considered in different lights by different interpreters of it.

2 Hume's account of knowledge

Knowledge and probability. In Hume's early works, the term 'knowledge' is restricted to what is certain, and the term 'probability' (in a wide sense) is used in the *Treatise* for all factual beliefs which might get revised. (Later Hume is more willing to talk with the vulgar, and use 'knowledge' less strictly, 'probability' more narrowly.) Knowledge in the strictest sense is confined to current sense impressions, along with 'intuitions' about the relations between currently sense-perceived qualities, and certain 'relations of ideas', namely those that are 'demonstrably certain'. 'Demonstration' shows that some claims must be affirmed if we are to avoid self-contradiction. Factual claims are never of this 'demonstrated' sort. They are either, if restricted to current sense certainties, known immediately, or, if they make a claim about what goes beyond the evidence of current sensation, then they will be less than certain. Some past tense factual claims will be based on memory (and we can of course misremember), but most factual claims depend upon some inference which takes us from the evidence of current sense impressions and memories to a belief about what we have not, or not yet, ourselves observed. Hume's main concern in Book I of the *Treatise* and in the *Enquiry Concerning Human Understanding* is to examine these latter inferences, and distinguish the relatively well-supported from the less well-supported of them. Of particular interest to him are those that involve reliance on other people's testimony, and his famous discussion of the acceptance of reports of miracles (*Enquiry Concerning Human Understanding*: X) puts all the main principles of his epistemology to work. (This discussion was originally intended for inclusion in the *Treatise*.)

Impressions and ideas. Hume's most general epistemological principle is that all 'ideas', the contents of our thought, derive from more lively 'impressions', the contents of our sense experience and emotional experience. This is put forward at first as an empirical thesis, but it is also used as a normative principle. Impressions are either 'of sense' or, like passions, 'of reflection'. Ideas for which impression-credentials cannot be produced are dubbed 'false', 'imagined', or 'pretended' ideas. Hume takes this line with the idea of a vacuum, and of duration without change. We may *think* we have such ideas, he argues, but we cannot really have them. It is as if ideas, simply by being ideas, make some implicit claim to having impressions as their source, and, if such claims cannot be made good, they are dismissed as false pretenders. Ideas which go well beyond their impression data are termed 'fictions'. These include the idea of the continuous existence through time of physical things we have only intermittently observed, and of the identity of our own minds, with their everchanging perceptions. In accepting such ideas we 'disguise the variation' and 'remove the interruption' (*Treatise*: 254) in the data on which such ideas are based. This constructive contribution of the human mind, in its interpretation of the data of its experience, was

highlighted also by Immanuel Kant, who promoted Hume's 'fictions' into a priori 'categories'.

Abstract ideas. Hume follows Berkeley in taking every idea to be fully particular or 'individual', and to refer to something of which we have had or might have an impression. Abstractness and generality get into ideas by the use to which they are frequently put in our thinking. A particular idea becomes general, on a given occasion for a given thinker, if, for the purposes in hand, any other idea from a certain set could be substituted for it - if it is serving as a representative of that group of resembling ideas. The words of the thinker's language label these sets (are 'annexed' to them), and fix the sort of 'resemblance' determining their membership. So if our purpose is to consider a claim about all triangles, we will begin with an 'image' before our minds of, say, an equilateral triangle, but we may and should substitute other ideas of other types of triangles to test the claim. As Hume puts it, it is as if the thinker had 'a whole intellectual world of ideas' available to them, all of them ideas of particulars, but 'collected together' in groups and 'plac'd under a general term with a view to that resemblance which they bear to each other'. We show a capacity to 'pick out such as were most proper for our purpose' (*Treatise*: 24). Hume terms this instinct for relevance 'a kind of magical faculty in the soul'. At times he speaks as if the crucial resemblances are recognized before the resembling ideas are 'plac'd under a general term'; at other times it seems as if the prior availability of such terms is crucial to the operation of abstraction, as he analyses it. To treat language as a great aid to abstraction and generalization, rather than an indispensable precondition, would sit better with Hume's views about the role of generalization in causal inference, since he attributes causal inference to animals who lack language. He says that 'men…surpass animals in reasoning', and that 'books and conversations enlarge the sphere of one man's experience and thought' (*Enquiries*: 107).

Causal inference to new beliefs. Hume defines belief as 'a strong and lively idea deriv'd from a present impression related to it' (*Treatise*: 105). The derivation is by causal inference; the relation is causation. The inference is a move of the mind from some impression of sense (or memory) to a conclusion about what is not (or not yet) observed. The conclusion inherits liveliness, 'vivacity', or 'the belief feeling' from its impression-premise. An inference such as 'this is bread, so it will nourish' is never a 'demonstration', since there would be no logical self-contradiction in affirming the premise but denying the conclusion. Memory may assure us that in the past bread has nourished us, and current sense impressions may assure us that this seems to be bread, but what assures us that this bread will act on us as past bread has acted? We can try to convert the causal inference 'this is bread; past bread has nourished us; so this will nourish us' into a 'demonstration' by supplying an extra premise claiming that 'instances of which we have no experience must resemble those of which we have had experience' (*Treatise*: 89); but to claim that we *know* this, that it is certain, would be false pretence. It itself cannot be 'demonstrated'. Moreover, if we try to make it a matter of 'probability', itself a conclusion of an inference whose premise is that *in the past* instances which we had not yet experienced turned out to resemble those we had already experienced, we would have an inference of the same form as the original one, from evidence about the observed to a conclusion about the unobserved. To try to support the 'presumption' that 'the course of nature always continues uniformly the same' by pointing out that it *has* so continued is to give an answer that 'gives still occasion to a question of the same kind, even *in infinitum*' (*Treatise*: 91). We cannot turn our original inference into a sound demonstration. Either we add a premise about what nature 'always' does, which is merely dogmatically asserted, and so get a valid demonstration one of whose premises is a mere 'presumption', or we add less general premises for which we can provide empirical verification, but which leave the inference non-demonstrative in form.

Hume in *Enquiry Concerning Human Understanding* presents this argument as if it provides 'sceptical doubts concerning the operations of the understanding'. In the *Treatise* it is simply a phase of a longer positive argument to the conclusion that ''tis only so far as it [causation] is a natural relation, and produces an union among our ideas, that we are able to reason upon it, or draw any inference from it' (*Treatise*: 94). This is the substance of what the *Enquiry Concerning Human Understanding* calls the 'sceptical solution' to the 'sceptical doubts'. For Hume the scientist of human nature it is simply a fact about us, and a fortunate one, that like other animals we do make causal inferences; unlike them, however, we are able to realize exactly what we are doing, and to formulate rules to help us do it better, so that our predictions will be less often falsified.

The *Treatise* account of our belief formation through causal inference is not only explanatory but also normative, since it ends in rules for improving our inferences. Hume shows how we can see causal inferences as cases of mental association, and explains just what is special about association by 'causation'. Originally in the *Treatise* (Bk I, Pt I, Sect. IV), he had simply listed causation as one of the three 'natural relations' or associative principles.

But its effects are found to be special. Only causation, among the forms of association, can form a new belief - not merely, like the other principles of association, revive an old one, or make it more vivid. Hume undertakes to analyse the causal relation as we perceive it, so as to show how it can guide inference to new factual beliefs. He takes it to require contiguity, rather than distance, in space (one of the other principles of association), contiguity in time in the form of immediate priority in time, and some other more mysterious element that we perceive as 'necessary connexion'.

It is not until near the end of his long account that Hume can demystify that important ingredient in our idea of cause, although 'hints' had been given eight sections earlier, when Hume had 'discover'd' a 'new relation betwixt cause and effect, …*Constant Conjunction*' (*Treatise*: 87; original emphasis). Although 'from the mere repetition of any past impression [or successions of impressions?], even to infinity, there never will arise any new original idea, such as that of necessary connexion', he had written, 'it wou'd be folly to despair too soon', and in the end it turns out, on his story, that the experience of constancy of temporal conjunction does produce something from which the idea of necessity can be derived, namely inference, or constrained belief, what Hume calls 'the determination of the mind'. His prediction that 'Perhaps t'will appear in the end, that the necessary connexion depends upon the inference, instead of the inference's depending on the necessary connexion' (*Treatise*: 88) turns out to be correct. Necessity 'lies only in the act of the understanding' (*Treatise*: 166). Causal necessity has been reduced to the inferability of one member of a constantly conjoined pair of events from the other. So Hume then offers us two alternative definitions of causation, one as constant conjunction, the other as inferability.

In Section V of the *Enquiry Concerning Human Understanding* Hume says that the 'custom' that determines our causal inferences has 'equal weight and authority' with the 'reason' which is at work in demonstrative inferences. Yet he calls his naturalistic solution 'sceptical', and in Section XII of the *Enquiry Concerning Human Understanding* refers to the sceptic's 'triumph' in such an analysis of causal inference. In the *Treatise* the 'rules' offered for improving our causal inferences are characterized as having the status only of 'unphilosophical probability', or prejudice, albeit a reflexive case of prejudice. Sceptics may be pleased, Hume writes, when they observe 'a new and signal contradiction in our reason…the following of general rules is a very unphilosophical species of probability; and yet 'tis only by following them that we can correct this, and all other unphilosophical probabilities' (*Treatise*: 150). Scholars continue to disagree about the sense of 'sceptic' in which Hume sees himself as one of these sceptics, and about what most pleased him in his account of causal reasoning.

Testimony, credulity, and miracle reports. Hume's descriptive account covers bad as well as good causal inferences and probability estimations, and it is as part of his attempt to separate the better from the worse inferences that he looks at our reliance on human testimony, the inference from the fact that someone says they witnessed something to the conclusion that they did witness it, or, more generally from the fact that they say that they believe something, and have good evidence to do so, to the conclusion that they do believe it, and do have the evidence they claim for it. A large part of what we call 'education', Hume says, is simply believing what we are told, especially if it is repeated over and over again. (This for him confirms how sensitive we are to repetition.) Such uncritical credulity is out of conformity to Hume's epistemic rules. 'The wise man…proportions his belief to the evidence' (*Enquiries*: 110). The evidence on human lying, and on human error, should give us pause before believing all we hear. When what we hear goes counter to the most widely established 'constant conjunctions', when it is something that it suits someone's purpose that we believe, when it caters to our own suspect 'inclination to the marvellous', and especially when all these factors are present, the wise person is on their guard. Miracles, claimed violations of laws of nature on which religions are founded, do combine all these factors. 'What greater temptation than to appear a missionary, a prophet, an ambassador from heaven?' (*Enquiries*: 125). Self-delusion and 'pious frauds' are to be expected in such cases, from both reporter and hearer of the report. To anyone who looks calmly at the human record of miracle reports and at the rival religions founded on such reports, and who then weighs the probability that a reporter of such a miracle is lying or deluded against the 'proof' (constancy of conjunction), which is the support for the 'law of nature' that supposedly has been violated, the conclusion will be clear. 'We may conclude that the Christian Religion not only was at first attended by miracles, but even at this day cannot be believed by any reasonable person without one.' Hume here does his typical reflexive turn - as he applies causal reasoning to itself, so he here applies his account of belief in miracles to that very belief itself. (This idea is celebrated in the title of a modern challenge to theism, John Mackie's *The Miracle of Theism*.)

Bodies and minds. Book I, Part IV of the *Treatise* explores 'sceptical and other systems of philosophy'. The influence of Berkeley is apparent in Hume's discussion of our belief in lasting physical things, but Hume, unlike Berkeley, cannot appeal to God's notions of physical things to explain their individuation and identity. Belief in lasting bodies pervades our interpretation of current sensations, and so infects the terminology in which most of our causal inferences are formulated. So if these beliefs are, as Hume claims, mere 'fictions', based on 'false suppositions' (*Treatise*: 217), then our causal inferences will also be contaminated. Belief in lasting material objects ('bodies'), Hume claims, helps us to shore up our belief in constant conjunctions, since we just assume that although we may not have observed some particular cause or effect, it nevertheless happened. Lasting things serve as homes for unperceived events, and we need to believe in them to sustain our faith in 'nature's' regular course of action. But some uses of causal analysis, in particular those used to examine the causal relation between physical stimuli and our sense organs, and the supposed relation of 'secondary' to 'primary' properties, can seem to destroy our belief that in sense perception we get reliable information about lasting bodies. There is an unstable relation between our trust in causal inference and our presumption that there are lasting physical things that are involved in causal relations with one another, and with our minds. The first part of the conclusion to Book I of the *Treatise* explores this instability.

Hume's account in the *Treatise* (Bk I, Pt IV, Sect. VI) of what we believe about the identity of our own minds over time, an account supplemented in Book II of the *Treatise*, when he turns to personal identity 'as it regards our passions' (*Treatise*: 253), is less sceptical than the account of belief in lasting mind-independent bodies. However, in the 'Appendix' he reports that his hopes that a contradiction-free account could be given of our self-conceptions and the sort of identity we have reason to ascribe to ourselves (*Treatise*: 633) had been dashed when he realized that, in the section on personal identity, he had involved himself in a 'labyrinth'. Commentators do not agree on just what the perceived difficulty was. He had rejected the idea of a simple self, possessor of its perceptions, since there is no impression from which such an idea could be derived. The 'true idea' of any human mind is of a 'system of different perceptions or different existences, which are link'd together by the relation of cause and effect, and mutually produce, destroy, influence, and modify each other' (*Treatise*: 261). The identity of a mind is 'only a fictitious one, and of a like kind to that which we ascribe to vegetables and animal bodies' (*Treatise*: 259). The most proper analogy, however, is not to bodies but to a 'republic or commonwealth… as the same individual republic may not only change its members, but also its laws and constitution; in like manner the same person may vary his character and disposition, as well as his impressions and ideas, without losing his identity' (*Treatise*: 261). This account of the 'fiction' we tell ourselves about our (and our nation's) identity, and of the factual supports which give it believability, had seemed a satisfactory substitute for the rejected rationalist view that we know ourselves to be simple thinking substances, with an unchanging essence, persisting uninterruptedly through time. But the 'Appendix' finds the account given of 'the principle of connexion' that binds the 'different existences' together to be 'very defective'. Hume's 'scepticism' (*Treatise*: 633) about his original account of the achievable coherence and empirical well-groundedness of our ideas of ourselves continues to spawn a wealth of interpretative literature.

On Hume's own account, if it takes very 'refin'd and elaborate' or 'metaphysical' reasonings (*Treatise*: 268) to see the difficulties the philosophical sceptic finds, then even the mind that has seen them usually 'quickly forgets' them. His own purported attitude to our questionable beliefs about the world and ourselves is, by the end of the conclusion of Book I of the *Treatise*, that of the 'true sceptic', who, while not forgetting his philosophical doubts, is nevertheless as diffident about them as about his earlier convictions. In both cases he defers to his readers to point out to him any errors they find in his reasoning. Plenty of readers have taken up Hume's invitation, especially when it comes to his *Treatise* writings on personal identity. In the *Enquiry Concerning Human Understanding* he dropped this 'difficult' topic, and very much curtailed his treatment of belief in lasting bodies and a 'material world' (Sect. XII, Pt I). 'A blind and very powerful instinct of nature' is said to make us have and preserve a belief in lasting external objects, and trust our own senses to give us reliable information about such objects. 'The profounder and more philosophical sceptics' will be able to shake our blind faith, producing 'momentary amazement and confusion', but if we ask the sceptic 'what he proposes by all these curious researches?' 'if any durable good or benefit to society could ever be expected to result' (*Enquiries*: 159) from dwelling on his arguments, then, Hume says, the sceptic is the one who will be embarrassed.

Social epistemology. Hume's discussions of human knowledge in his essays and in the *History of England* keep

the question ‘Do you expect durable good and benefit for society to come from your epistemological researches, or are you merely amusing yourself?’ very much in the forefront of their author’s mind. His question becomes ‘When and how do various branches of knowledge grow?’ not ‘Is knowledge possible?’ Where his earlier epistemology was ‘abstruse’, analytical, and general, his later epistemology is much less general, and not at all abstruse. His interest shifts to social epistemology. Do the sciences thrive better in a republic than in a monarchy? What sort of representation does a guinea make, and would it make a different representation if it were made of copper, not gold? What relation is there between commercial trade between nations and exchange of ideas? What has the invention of the printing press done to the life of the mind, and what other inventions make or might make comparable changes? Epistemology merges into social philosophy and ethics.

3 Human passions and human actions

Passions and sentiments. Hume takes us to share our basic passion-repertoire, as well as our ability to learn from experience, with the higher animals. They may lack moral, aesthetic, religious, and philosophical ‘sentiments’, but they do, if Hume is right, love, hate, feel pride and shame, as well as desire, enjoy, suffer, hope, and fear. Their passions have the same sorts of objects that ours do, and we can sympathize with some of their passions, as some of them can with some of ours. ‘Passions’, with the exception of a few instinctive appetities, are ‘impressions of reflection’, reactions of pleasure or displeasure to some perception of our situation.

All passions have ‘objects’, what Brentano called ‘intentional directedness’ and others have termed ‘aboutness’ (see Intentionality). ‘Direct’ passions, such as desire, joy, sorrow, hope and fear, are caused by their ‘objects’. What Hume calls the ‘indirect’ passions, such as pride, involve both the thought of something that pleases, such as a fine cloak, and also the recognition of that good thing as belonging to a particular person, bringing a consequent pleasure in that person. Should the particular person be oneself, the pleasure one feels will be pride. Should it be another person, the pleasure will be affection or esteem for that person. So the basic ‘causes’ of all passions are ‘agreeable’ pleasure and ‘uneasy’ pain or distress, and thoughts about their causes or occasions. Since they are ‘impressions *of reflection*’, they are equally founded on our thoughts about what has given or would give us such pleasure and pain. Throughout Parts I and II of Book II of the *Treatise*, Hume traces ‘the double relations of impressions and ideas’ which are responsible for the varieties of pride and humility, love and hate, and various mixtures of them. He invokes association by resemblance to explain the transitions in our emotional life from one pleasure to another (from being pleased by some witticism to being pleased with the friend who uttered it), and he invokes association of more varied sorts to explain the thought transitions involved in such sequences of passions.

When Hume rewrote his account of human passions, as given in Book II of the *Treatise*, in one of his *Four Dissertations*, ‘Of Passions’, he blunted the distinction between direct passions such as joy and indirect passions such as pride, but he is still fairly boastful about the explanatory power of his principles of association. The *Dissertation* reverses the order of treatment in the *Treatise*, beginning with hope and fear and moving on to pride, humility, love, and hate, which he terms not ‘indirect’, but simply ‘passions of a more complicated nature’, ones which ‘imply more than one view or consideration’. The substance of the account is largely unaltered, and the ‘mechanics’ of association are still very prominent, but the order of treatment and the terminology have changed.

In both *Treatise* and *Dissertation* a distinction is drawn between ‘calm’ and ‘violent’ passions. This cuts across the distinction between relatively simple (or ‘direct’) passions and relatively complicated ones. Any passion can become violent. A passion, say a desire, is said to be violent when it produces ‘sensible emotion’ (*Treatise*: 417) or ‘sensible agitation’. Passions tend to become violent when one ‘swallows up’ another, thereby getting ‘new force and violence’, when a passion encounters opposition or delay in gratification, when uncertainty produces ‘agitation’ in the mind, including the case where the object of a passion is temporarily absent, or partially concealed or veiled. Although violence is not the same as strength, still the ‘force’ it involves usually strengthens a passion, so that ‘when we wou’d govern a man, and push him to any action, t’will commonly be better policy to work upon the violent than the calm passions’ (*Treatise*: 419). Custom, by giving us ‘facility’, can strengthen a passion despite the fact that it removes some causes of violence, namely agitating novelty, challenge, and uncertainty. Hume ends the *Dissertation* with the expressed hope that he has shown that ‘in the production and conduct of the passions, there is a certain regular mechanism, which is as susceptible of as accurate a disquisition, as the laws of motion, optics, hydrostatics, or any part of natural philosophy’. (Here he seems to echo Spinoza in his preface to *Ethics* III.) The ‘mechanics’ of violence in passions, however, seems a little less than fully

systematised by Hume. Since, in the *Treatise*, he wants to explain the errors of rationalists in ethics in part by the hypothesis that they confuse calm passions with reason, any inadequacies in his account of calm and violence has repercussions for his case against the rationalists.

Sympathy. All passions can be and often are communicated from one animal or person to another, through their understood bodily expression and our response to that in what Hume calls ‘sympathy’. Sympathy enlivens a mere idea of another’s passion into an impression. ‘The howlings and lamentations of a dog produce a sensible concern in his fellows’ (*Treatise*: 398). It is not only distress which is thus communicated, but any expressed passion, or even opinion. ‘This is not only conspicuous in children, who implicitly embrace every opinion propos’d to them; but also in men of the greatest judgment and understanding, who find it very difficult to follow their own reason or inclination, in opposition to that of their friends and daily companions’ (*Treatise*: 316). We spontaneously imitate the expressed state of mind of those around us, Hume believes, and this communication of feeling, along with its extension by our ability to imagine what others would feel, in various circumstances, is essential for the possibility of ‘the moral sentiment’. But there is also a ‘principle’, or basic tendency, which interferes with the workings of sympathy. This is ‘comparison’, which leads us to ask if we are doing better or worse than others. We can welcome another’s misfortune, rather than feel compassion for them, if that misfortune points up our own better fortune. ‘Comparison’ is invoked by Hume to explain malice and envy. He treats remorse as a case of malice against oneself, ‘an irregular appetite for evil’. He finds envy to be typically felt for those close in position to ourselves, and to be felt even when we are ‘superior’, should our inferiors be perceived to be advancing.

Sympathy can be blocked by the operation of ‘comparison’, but is facilitated by the perception of any sort of ‘natural relation’ between ourselves and others. ‘Similarity in our manners, or character, or country, or language…facilitates the sympathy’ (*Treatise*: 318). (Blood ties, and spatial contiguity also facilitate it.) Sympathy is sharing the feelings of others perceived to be like ourselves, or related to us, and so is felt differentially. Hume takes the moral sentiment to correct for such natural partialities in our sympathy.

The will, passion, and action. Hume includes an account of the will, and its freedom or lack of it, in Book II of the *Treatise*. Although he takes will to be the transition from thought and passion to action, it is discussed in his book on the passions, since ‘the full understanding of its nature and properties is necessary to the understanding of them [the passions]’ (*Treatise*: 399). The ‘mechanical’ nature of human passions is found to be corroborated by the ‘uniformity and regularity’ of human conduct. Our decisions and behaviour are just as predictable (in principle) as what happens in inanimate matter. We have at best ‘the liberty of spontaneity’, on those occasions when our behaviour has determining causes internal to us as persons, rather than ‘violent’ external causes, overriding our own conscious wishes. In the *Enquiry Concerning Human Understanding* Hume defines liberty as ‘the power of acting or not acting according to the determinations of the will’, (*Enquiries*: 94) and the will’s determinations are taken themselves to have their own psychological determining causes. This makes liberty a property not of the will, but of the agent (see Will, the). In this, as in his determinism, Hume agrees with Hobbes.

His account of our motivation, then, is that the complicated play of our passions, closely affected as they are by our memories, beliefs, and imaginings, lead to our intentions, ‘the determinations of our will’. These, as long as we are at liberty and do not forget or change our minds, get realized in our actions. Because passions are ‘impressions’, they are active psychological causes, sufficient to cause action. Because they are ‘impressions of reflection’, they incorporate the information about our situation that our memory, our beliefs, our reason and our reflection have given us. They need not be blind, however partial their ‘views’ often are. Hume’s account of the passions which motivate us makes them intrinsically reflective and thought-informed.

Because Hume takes our passions to determine our actions, the sort of conversation and company we provide, and the sorts of institutions, books, and artworks we are likely to produce, the evaluation of our passions becomes very important. His essays ‘Of Tragedy’, and ‘Of the Standard of Taste’ explore the passions literature arouses, our pleasure in it, and evaluation of it. Moral evaluation, he holds, is always the evaluation of ‘character’, of ‘principles in the mind and temper’ (*Treatise*: 477). His careful exploration of different sorts of sensitivity or ‘delicacy’, in the essay ‘Of the Delicacy of Taste and Passion’, like his investigations into relative ‘violence’ in passions, and into the role played in our passions by sympathy and by ‘the principle of comparison’, as well as his discussion of liberty and necessity, all feed into his account of moral evaluation.

Hume’s ‘moral psychology’ bears a striking similarity to Spinoza’s. Whether he had read Spinoza’s *Ethics* or just

Bayle's version of it, he certainly shows agreement with Spinoza's deterministic version of our psychology, and with particular points of detail, such as the effects of vacillation. His account of the effect of opposition on the violence of a passion (so that we naturally 'desire what is forbid') and his negative treatment of remorse, also repeat theses that Spinoza had advanced (see Spinoza, B. de; Bayle, P.).

4 Ethics

The virtues. Hume takes it to be agreed that moral judgment is primarily a judgment about human character traits, a recognition of 'virtues' and 'vices' (see Virtues and vices). He has some controversial views both about what enlightened moral judges will and will not include in their lists of virtues, and about how they do their judging.

In his 'catalogue of virtues' he distinguishes the 'natural virtues' from what in the *Treatise* he calls 'artificial', or convention-dependent, virtues. The latter consist in conformity to some beneficial social scheme of cooperation, such as a particular form of government. The artificial virtues, for him, include 'justice' (taken to include respect for traditional property rights, and 'fidelity to promises'), 'allegiance' (to magistrates), female modesty and chastity (preparation for and conformity to the role given to women in the artifice of marriage), and the duties of sovereign states to keep treaties, to respect each others' territorial boundaries, to give protection to ambassadors, and otherwise conform to 'the law of nations'. All the artificial virtues will be expected to take different specific forms in different societies and historical conditions.

In contrast to the artificial virtues, the 'natural' virtues are expected to be fairly invariant across cultures. Hume includes among the natural virtues compassion, generosity, gratitude, friendship, fidelity, charity, beneficence, clemency, equity, prudence, temperance, frugality, industry, courage, ambition, due pride (duly concealed so as not to offend others), due modesty (awareness of one's weaknesses), due self-assertiveness, good sense, wit and humour, perseverance, patience, courage, parental devotion, good nature, cleanliness, articulateness, responsiveness to poetry, decorum, and 'a certain *je-ne-sais-quoi* of agreeable and handsome', which 'render a person lovely or valuable' (*Treatise*: 611-12). The controversial features of his catalogue lie in part in the substitution of pride for humility, in part in the inclusion of qualities which do not depend on their possessor's will, and in part in the particular glosses he gives to traditional virtues such as courage and charity.

Courage is to be exercised, if possible, in non-military contexts, so that it need not involve killing or 'the sack of cities'. About charity Hume says:

> Giving alms to common beggars is naturally praised; because it seems to carry relief to the distressed and indigent: but when we observe the encouragement thence arising to idleness and debauchery, we regard that species of charity rather as a weakness than a virtue.
>
> (*Enquiries*: 180)

From the truly beneficent person, the hungry may indeed 'receive food, the naked clothing', but mainly because from such a person they will also receive 'skill and industry' (*Enquiries*: 178). Hume's later essays on economics develop this theme.

Hume's list of virtues is a self-conscious rejection of a puritan morality, and to some extent of Christian morality. Not only, as he wrote to Francis Hutcheson, does he not take his 'catalogue of virtues' from *The Whole Duty of Man* (a Protestant religious tract he had been encouraged to read as a child), but he finds some of the virtues listed there to be vices, from the point of view of a morality which has freed itself from 'the delusive glosses of superstition and false religion'. Hume's ethics are avowedly hedonist (see Hedonism). All virtues, he generalizes, are qualities that please from a moral point of view either because they prove 'agreeable' (tend to bring pleasure) to their possessors or to others, or else because they are seen to have 'utility' for their possessors or for others. 'Celibacy, fasting, penance, mortification, self denial, humility, silence, solitude, and the whole train of monkish virtues' are, he finds, neither agreeable nor useful; they 'stupify the understanding and harden the heart, obscure the fancy and sour the temper' (*Enquiries*: 270). *The Whole Duty of Man* had included, in its list of breaches of duty, various breaches of the duty of humility, and such other sins as 'eating too much', 'heightening of lust by pampering the body', 'not labouring to subdue it by Fasting, and other Severities', and 'not assigning any Set or Solemn time for Humiliation and Confession, or too seldom'. It was not merely the 'monks' whom Hume was opposing when listing the virtues, but the Calvinists who had preached to him, and the other Protestant divines

whose tracts he had been given as a child to help him learn to recognize vice.

But there are very many of the duties listed in *The Whole Duty of Man* that Hume includes in his catalogue, and that repeat those listed in Cicero's *Offices*, which he told Hutcheson was his preferred source book on morals (see Cicero). 'Not loving peace', and 'going to law on slight occasion', as well as theft, ingratitude, lying, malice, and oppression are all condemned in *The Whole Duty of Man*, and Hume would have little quarrel with these disapprobations. He told Boswell that, as a child, he skipped such things as theft and murder, in the list of sins provided by the *Whole Duty*, 'having no inclination to perform them'. As far as murder goes, not only did he omit to think about it, when examining his conscience as a child, but he omitted to consider it carefully enough in his moral philosophy. After citing parricide as a 'horrid crime' which rationalist moralists may have difficulty explaining, he then proceeds to say all but nothing in his own voice about what is wrong with homicide (as distinct from cruelty). He defends suicide (in the posthumously published 'Of Suicide'), and discusses varying tolerance of it and of tyrannicide in 'A Dialogue', (published with *Enquiries Concerning the Principles of Morals*) but gives us no extended discussion either of any artifice-grounded right to life, or of any natural virtue consisting of respect for human life.

Which forms of killing are vicious, and why? The rationalist answer may well have weaknesses, or even incoherencies, but Hume gives us no explicit answer. At most he gives us hints, such as 'While we are ignorant whether a man were an aggressor or not, how can we determine whether the man who killed him be criminal or innocent?' (*Enquiries*: 290). There are also many discussions of particular killings in the *History of England*, where Hume charts the shifting penalties for murder, their variation depending on the rank and sex of the victim, and the various degrees of cruelty in methods used by official or semi-official killers. (See his accounts of the killing of the exiled Queen Elgiva, of King Edward II, of Joan of Arc, as well as of the followers of Wycliff and other martyrs at the hands of various church and state authorities.)

Hume calls it a verbal matter that he includes among the virtues qualities of mind, such as wit and good sense, and 'involuntary' as well as 'voluntary' abilities. But it is no *merely* verbal matter that he refuses to call the 'involuntary' excellences 'talents', and to separate them from moral virtues. A sharp distinction between the voluntary and the involuntary is needed, he wrote in the *Treatise*, only by those who are handing out rewards and punishments, hoping thereby to regulate voluntary actions (*Treatise*: 609). But expressed moral approbation and disapprobation, as he understands them, are not deliberate reward and punishment, nor need they be preludes to reward and punishment. They are the more or less spontaneous expression of moral sentiments, themselves no more wholly voluntary than their objects. 'Philosophers, or rather divines under that disguise, treating all morals on a like footing with civil laws, were necessarily led to render this circumstance, *voluntary* or *involuntary*, the foundation of their whole theory' (*Enquiries*: 322). Hume does not treat morals this way, and so he is just as 'necessarily led' to resist the restriction of moral judgment to the voluntary.

Artificial virtues: justice. The part of morals that Hume does treat as being on a like footing with civil laws, and so as sanction-backed, is the area covered by 'the artificial virtues'. These consist in conformity to some generally beneficial convention, where the benefit accrues not act by act, but from the 'whole scheme of actions'. Since general conformity is needed for the benefit to be obtained, pressure is deliberately brought to bear, on adults as on children, to get them to show honesty in matters of property, to keep their promises, to show allegiance to lawful magistrates, and to show chastity and marital fidelity, at least if they are women.

'Justice', as rendering each their due, is taken by Hume to be primarily respect for property rights. His brief discussion of what we would call retributive justice is to be found in his discussion of liberty of the will (and throughout the *History of England*), not in his account of what he calls 'justice'. Although he frequently refers to equity, it is not clear what relation he took it to have to justice. (He includes it in a list of natural virtues.) What he argues about 'justice', in his sense, is that we need to have a convention establishing property, and establishing particular property rights, before anything could count as respect for such rights. Similarly, he will argue, we must have the social institution of promise (or contract, taken as mutual promise) before anything could count as keeping or breaking promises, and must have the institution of government before anyone can count as a superior, to whom allegiance is owed. To get the needed distinctions between possession and property, or between telling someone what one will do and promising to do it, or doing what one is told and showing allegiance to one's rightful superior, we must be able to turn to some social 'convention' which promotes some cases of possession

into ownership, some transfers into barter, gifts, loans or sales, some statements of intention into promises, some issuing of sentences in the imperative mood into lawful commands.

In the *History of England*, when reporting John Ball's 'seditious preaching' in the late fourteenth century, Hume describes the popularity of Ball's doctrine of 'the first origin of mankind in one common stock, their equal right to liberty and to all the goods of nature, the tyranny of artificial distinctions'. He says that such doctrines are bound to be popular since they are 'so conformable to ideas of primitive equality, which are engraven in the hearts of all men' (Ch. XVII). His own story, which he owes to Lucretius, about the origins of justice is not so different from Ball's, except that he emphasizes the inevitability of 'artifice', and does not regard it as necessarily bringing tyranny. The 'primitive equality' he recognizes lies in the need to get the agreement of each person to limiting the equal access of all to 'all the goods of nature'. Until there is a general agreement ending the primitive scramble to grab what one can from the goods of nature, then nothing will count as theft, as unjust taking, as wrongful possession. On Hume's story, only when every person sees, or seems to see, that they will be better off if present possession is frozen into rightful possession, into property, and only when there is an agreement to take only with owner's consent, can it cease to be all right for people to take what they please and can. Hume's story, like Ball's and like Hobbes' before him, and like that of Rousseau after him, presupposes the postulation of a primitive equality and liberty. The 'convention' needed to create private property rights, Hume writes, depends upon a 'general sense of common interest', on the perception that although any single property-respecting act may not bring advantages, indeed may involve loss, still 'the whole system of actions, concurr'd in by the whole society, is infinitely advantageous to the whole and to every part' (*Treatise*: 498). Unlike the Lollards and Levellers, however, Hume thought that rational and long-sighted convenors would see that equality of property, however theoretically desirable, is impracticable: 'Render possession ever so equal, men's different degrees of art, care, and industry will immediately break that equality. Or, if you check these virtues, you reduce society to the most extreme indigence' (*Enquiries*: 194). 'The most rigorous inquisition too is requisite to watch every inequality on its first appearance, to punish and redress it…so much authority must soon degenerate into tyranny' (*Enquiries*: 194). Where Ball saw inequality to depend upon tyranny, Hume sees the threat of tyranny to accompany the attempt to prevent inequality. But his sympathy with the egalitarians' ideals is as clear as his disagreement with them concerning the costs of equality.

Artificial virtues: fidelity to promises. Hume's analysis of promises and promissory rights follows the same lines as the analysis of property and property rights. Until a convention fixes which assurances are binding assurances, there will be no promises or contracts. The fixing, as in the case of property, will contain some elements of arbitrariness. Societies vary in such matters as the need for witnesses, for the contract to be written and signed, for there to be some 'consideration'. Hume takes the function of promise to be to extend security in transfers of goods and services to include future delivery and future services. He takes there to be a special form of words, 'I promise…' used when such binding assurances are given, and he takes their force to include the promisor's acceptance of the appropriateness of penalty in the form of withdrawal of trust (and thus disablement as a party to binding agreements) if the promise is broken. This informal enforcement of the sacredness of promissory obligations gives promises their verbal magic. Hume likens them to the priest's words in the mass, to the magic of transubstantiation, with the significant difference that 'the obligation [binding force] of promises is an invention for the interest of society', while 'priestly inventions…have no public interest in view' (*Treatise*: 524).

Hume denies that promises need to be given when any convention is accepted. Because he regards the obligation to keep promises and contracts as itself 'artificial', it would be absurd, he finds, to rest all artifice on promise. 'We are not surely bound to keep our word because we have given our word to keep it' (*Enquiries*: 306). Hume likens the conventions on which property and promissory rights rest to the tacit agreement we give to the conventions of our native language, or to the use of the monetary currency we find in use around us as 'measures of exchange', and to the agreement of rowers who both want to get in one boat across a river, and so coordinate their strokes. Recent contractarians have claimed Hume as one of them, despite his explicitly dismissing as absurd the suggestion that the agreement on which the obligations of justice rest could possibly itself be a mutual promise, and his rejection, both in the *Treatise* and in his essay 'Of the Original Contract', of the view that the authority of magistrates must rest on some promise or contract tying governor to governed. He agrees with the contractarians that the origins of justice lay in some sort of agreement that it was in everyone's interest to make with everyone else, but he would probably reject the label 'contractarian', and he certainly would not agree with those who try to

make all of morality, not only justice, rest on a hypothetical self-interested agreement (see Contractarianism).

Artificial virtues: chastity and modesty. Hume includes the virtues of female modesty and chastity among the artificial virtues, since he sees them to depend upon the existence of the institution of marriage, and in particular on the 'agreement' that husbands should not be expected to contribute to the upbringing of children they did not father. The only way men can have any confidence that the children born to their wives are 'really their own' (*Treatise*: 571) is by taking as wives only those women trained from childhood to an unnatural 'modesty', 'some preceding backwardness or dread' of sexual activity, and then by imposing the 'punishment of bad fame or reputation' on any wives suspected of infidelity. Hume stresses the 'unnaturalness', not just the social contrivance and usefulness, of these demands made on wives and would-be wives. It is in the interests of children that they receive care from a male as well as a female parent, and in general men can only be 'induc'd' to contribute to the care of children whom they take to be 'their own', so it becomes 'reasonable, and even necessary, to give them some security in this particular'. All men, Hume notes, including 'batchelors, however debauch'd', are shocked at 'lewdness or impudence in women', or at least in marriage-bent women. Is there irony in his account of the 'reasonableness' of a double standard? His early essays 'Of Love and Marriage', 'Of Polygamy and Divorces', and 'Of Moral Prejudices', continue his examination of the forms of marriage with which he was familiar, but readers do not agree on what these discussions reveal of Hume's own views.

How artificial virtue is inculcated. Hume takes it that we have a self-interested motive to adopt the policy of respecting property and keeping our promises and marriage vows since these 'inventions' are so designed that general conformity to their rules does bring advantages to 'the whole and every part' of society. And we have good moral reason to approve of such conformity. But, especially with property rights as they develop over a long period of time, and are affected by the transfers that have occurred through contract and through the invention of money, it is easy for a person to lose sight of the 'remote' and long term interest they may have in respect for established property rights. 'The artifices of politicians' may be needed to bolster their motivation. But Hume believes that we will usually see well enough what is wrong with disrespect for property rights when we are the victims of it. We see such disrespect as a 'vice', and feel disapprobation. We feel sympathy with other victims of theft, and our 'sympathy with public interest' leads us to condemn all breaches of property rights, however 'obscure' it may have become just what personal advantage we each get from a policy of honesty in preference to occasional judicious dishonesty. Hume grants that there may be no convincing answer to the 'sensible knave', who successfully conceals his dishonesty, and believes he does better than the scrupulously honest person. If educators, moralists and politicians have failed to give him 'an antipathy to treachery and roguery', if all he cares about is 'profit or pecuniary advantage', then no argument the moralist can provide is likely to change his mind. The moralist, on behalf of 'the party of humankind' (some of whom the clever knave is cheating and defrauding), may sincerely believe that the knaves are 'the greatest dupes', since they 'have sacrificed the invaluable enjoyment of a character, with themselves at least, for the acquisition of worthless toys and geegaws' (*Enquiries*: 283), but the knave will have his own sincere views about what is and is not worthless, and who are the dupes.

The moral sentiment, moral points of view. Hume takes virtues to be recognized as such by the moral sentiment, a special pleasure taken in agreeable and useful character traits, when these are surveyed from a 'general and steady' point of view. One of his most famous theses is that moral distinctions are not made by 'reason alone', but by the special sort of pleasure and displeasure we take in character traits and in the 'manners', or ways of behaving, that express them. Our approbation and disapprobation are what makes the approved traits virtues, the disapproved ones vices. 'We do not infer a character to be virtuous, because it pleases: But in feeling that it pleases after such a particular manner, we in effect feel that it is virtuous' (*Treatise*: 471). The 'particular manner' in which character traits must please to be virtues stems from the special 'point of view' which must be taken, and which we take in order to 'converse together on any reasonable terms' (*Treatise*: 581) about human merit. It is a 'steady and general' point of view which we have reason to expect others to be able to take, and from which agreement is in theory possible. In order to 'overlook our own interest', and get such a 'general' view, we must be capable both of sympathizing with other people's private viewpoints, and of correcting for natural bias in our sympathy. We consider how a given trait, say our own ambition, affects others, and try to see it as they see it. We do not ignore our own interest, but we look beyond that to the interests and concerns of everyone affected. When what we are judging is some military leader's courage, we will sympathetically consider both its effects on the armies he led, and his own nation, and also its effects on those against whom he led his forces, 'the subversion of

empires, the devastation of provinces, the sack of cities' (*Treatise*: 601). Moral approbation is a pleasure taken in a character trait, all things considered, and much preparation, including fact-finding, is needed to get to a point of view which really can claim to be general, which can expect to be 'steady', and expect to be shared.

Moral disagreement. Our expectation that our moral judgment will be shared with other moral judges is usually tempered by experience of moral controversy. Can Hume account for apparent moral disagreement? Even when we try to speak for 'the party of humankind', rather than just for ourselves, our class, or our nation, we often find other would-be representatives for humankind contradicting us.

Hume discusses apparent moral disagreement in 'A Dialogue'. 'Of the Standard of Taste' addresses what he sees as the closely similar topic of apparent disagreement about literary merit. In both these discussions Hume explains away the appearance of disagreement as due to some confusion, or lack of proper preparation or competence in some of the disagreeing judges. 'In moral decisions, all the circumstances and relations must be previously known; and the mind, from the contemplation of the whole, feels some new impression of affection or disgust, esteem or contempt, approbation or blame' (*Enquiries*: 290). Since very many judgments which purport to be moral are based on imperfect knowledge of circumstances, on narrow sympathies, on a contemplation of much less than 'the whole', it is not surprising that there is less than unanimity in such judgments. Whereas Hume takes all of us to be capable of becoming competent moral judges (if we are able and willing to rid our minds and hearts of 'the illusions of religious superstition and philosophical enthusiasm'), he took literary criticism to be a more elite skill, requiring both a 'delicacy of taste' and an extensive reading which not all could be expected to have. One interesting feature of his specification of the competent literary critic is that they show due allowance for difference of religion from writer to writer, so not condemn a book simply because of the false religion it presents, but show no such toleration on moral matters. The critic will be justly 'jealous' of their moral standards.

The arguments against the rationalists. Hume, in the *Treatise*, tries to refute the claims of rationalists such as Samuel Clarke that moral distinctions can be discerned by pure reason. His argument has two main parts. The first is that the conclusions of reason are 'ideas', but only 'impressions' can motivate, and moral distinctions are supposed to motivate. This argument relies on the sharp contrasts, drawn earlier in the *Treatise*, between impressions and less vivacious ideas, and between sense impressions and the passions they would need to 'concur' with, in order to motivate. Hume suggests that the rationalist may be mistaking calm passions, which do not agitate us, for passionless reason. The rationalist who disagrees with Hume's distinctions will be unmoved by his first argument.

The second part of the argument is that, in any case, there do not seem to be any rationally discernible facts or relations which would establish the sort of conclusion which the rationalist moralist expects to be able to draw, for example that certain sorts of behaviour (incest, killing a parent) are wrong if done by human beings, but not if done by animals or plants. This argument attempts to show that the wrongness of murder or incest is not a matter of rationally discernible relations. Hume cites the supposedly exhaustive list of 'philosophical' (cognitively discernible) relations of ideas given in Book I of the *Treatise*, and the claim of the *Treatise* (Bk I, Pt III, Sect. I) that only four of these, resemblance, contrariety, degrees in quality, and proportion in quantity or number, can be traced by 'demonstration'. Hume challenges any rationalist who disputes the completeness of his list of 'demonstrable relations' to point out the extra morally relevant relation. He requires that such a relation relate inner actions or states of mind to mind-external 'objects' (since he takes it that we all agree that moral judgment is restricted to expressed character traits), and that such a relation or relations determine what is 'forcible and obligatory' for all those capable of discerning them, that is for all rational beings. He takes it that, in order to found obligations, the relations would have to be shown to have a necessary effect on the will of all those who are obligated, and he seems to think that no rationalist could meet this challenge.

He adds, to his main anti-rationalist arguments, a famous 'observation' which he thought would 'subvert all the vulgar systems of morality' (*Treatise*: 470). This observation is that those who want to move from some factual claim to some conclusion about how we ought to behave owe us an explanation of how to derive the 'ought' of the conclusion from the 'is' of the premise (see Fact/value distinction). This is a challenge similar to that issued earlier to the rationalist who wants to found obligations on rationally discernible relations - to show a connexion to the will of the obligated, to show why that relation, or that fact, should fix for them what to do. He has not shown, nor does he claim to have shown, that there is no adequate answer to his challenges. 'Vulgar' rationalist systems may

be subverted by his observations, along with other vulgar systems, but more refined versions of such systems can be depended upon to find a way around the 'difficulties' which he challenges them to face.

5 Political and social philosophy

Nature and point of government. In the *Treatise* governmental authority is a social 'artifice', added to those of property, promise, and marriage. For it to come to exist, there must be a felt need that it satisfies, some 'convention' creating the right to govern, and bestowing it on some person or some group of persons. The need for government arises, Hume believed in the *Treatise*, only when other artifices, such as promise and contract, have enabled some people to accumulate so much property that they cannot adequately guard it against marauders, and to acquire it in ways suspected of fraudulence, so that others resent their possession of it. 'Acts of injustice' become frequent, and those who continue to respect property and promissory rights fear becoming 'cullies of their integrity'. What becomes needed is some security for the 'just' against exploitation by the 'unjust'. By creating a special job, that of 'magistrates', who will be responsible for 'the execution and decision of justice', such security is provided. The security is not only for the just against the unjust, but for the just impulses in any person against any temptation to injustice and inequity. Hume follows Hobbes in finding it a universal human weakness to see the attractions of the good that is close more easily than the attractions of 'remoter' goods, even when they are real and often greater. Without enforcement of property rules and contracts, 'the consequences of every breach of equity seem to lie very remote, and are not able to counterballance any immediate advantage, that may be reap'd from it' (*Treatise*: 535). The remedy, Hume writes, is to create rule-enforcers, so that there will come to be an immediate interest (avoiding punishment) as well as a remote interest (good character and reputation for it, social order and the benefits one gets from it) in avoiding acts of injustice. 'We are, therefore, to look upon all the vast apparatus of our government as having ultimately no other object or purpose but the distribution of justice, or, in other words, the support of twelve judges' (*Essays*: 27). These are Hume's words in 'Of the Origin of Government', a relatively late essay. In the *Treatise* he gave magistrates an additional role, namely coordinating new beneficial cooperative schemes which private enterprise might have neither motive to embark on nor the needed supervisory ability to bring to completion. Hume became more of a prophet for limited government as he grew older, but even in his late works he saw it as the governors' task not merely to declare and protect rights which pre-existed their own right to govern, but 'to point out the decrees of equity, to punish transgressors, to correct fraud and violence, and to oblige men, however reluctant, to consult their own real and permanent interests' (*Essays*: 38).

Who should govern. Hume is, of course, acutely aware of the difficulty of finding competent and reliable 'magistrates' or governors. In the *History of England* he praises the 'mixed' character of the English government, even in its earliest days providing some protection against tyranny. To avoid tyranny, powers must be balanced against each other, and the main tasks of politics as a 'science' are to find the best such balance, to design institutions that work well even when bad people are office-holders, and to provide for orderly transitions of power. The party system, the different roles of electorate, of the legislature, of monarch or other executive, of the judiciary, of the press, all should contribute to the goal of providing an ongoing government that really does serve the real interests of the governed.

Hume emphazises that there is some inevitable arbitrariness in the selection of governors. 'The magistrate may often be negligent, or partial, or unjust in his administration', and yet be a lawful magistrate, who is owed allegiance. The right to govern, like a property right, can be based on any of several different grounds. The hypothetical first magistrate might well have derived his authority from the consent of the governed, who might well have promised him allegiance:

> But when government has been establish'd on this footing for some considerable time, and the separate interest, which we have in submission, has produc'd a separate sentiment of morality, the case is entirely alter'd.
>
> (*Treatise*: 554)

> The same interest, therefore, which causes us to submit to magistracy, makes us renounce itself in the choice of our magistrates, and binds us down to a certain form of government, and to particular persons, without allowing us to aspire to the utmost perfection in either. The case is here the same as in that law of nature concerning the stability of possession.
>
> (*Treatise*: 555)

As the initial property rights were, Hume supposes, determined by ‘present possession’, to which in time get added ‘prescription’ or ‘long possession’, ‘accession’, ‘succession’, and ‘transfer by consent’ from former owners, so with governmental authority - a parallel plurality of grounds can be taken to establish it. What our ‘interest’ in government dictates is that the transitions from one governor to the next be smooth and nonviolent, and this paramount interest means that laws dictating how the next governor is to be selected are usually in place. ‘Positive law’, as well as ‘original contract’, ‘long possession’, ‘present possession’, and ‘succession’ can select the magistrates.

In his essay ‘Of the Original Contract’, in other essays, and throughout the *History of England*, Hume continues this *Treatise* discussion of the dangerousness and impracticality of being determined to ‘aspire to the utmost perfection’ in government, especially given widely different opinions of what method of selecting a magistrate is the more perfect. Consent or ‘original contract’ can get government started, but once any of the original contractors (subjects or sovereign), dies, or new subjects are born, it is wildly impractical and dangerous to demand renewed contracts. ‘Did one generation of men go off the stage at once, and another succeed, as is the case with silkworms and butterflies, the new race…might voluntarily, by general consent, establish their own form of civil polity, without any regard to the laws and precedents, which prevailed among their ancestors’ (*Essays*: 476). Hume has no quarrel with those who believe that ‘the consent of the people’ is ‘the best and most sacred’ of any claim to authority (*Essays*: 474), just as he has no quarrel with those who believe that equality would be the ideal distribution of property. In both cases, it is the means of trying to sustain the ideal state that pose the problems and the dangers. Even when nations do not aim so impossibly high as to found their governments on the consent of each and every subject, but appeal, as England did, to royal ‘succession’, disputes easily arise, and such disputes provide Hume with much of the storyline of the *History of England*. Hume’s political philosophy is realistic and pragmatic in character. Sympathetic though he is with the ideals of equality and government by consent, he sees the dangers of violence, disorder, and tyranny very vividly, and sees them to be the usual costs of aspiring to perfection in government. He did however write one very interesting essay on ‘The Idea of a Perfect Commonwealth’ in which his own republican ideals are developed, and he supported the cause of independence for the American colonies.

Hume’s later writings do not significantly alter his *Treatise* account of the function and authority of governments. They add mainly reflections on the relative wisdom of different governors and rebels against them, rather than any new points about the basis of governmental authority. The *History of England* tries to rebut the Whig claim that the English constitution, protecting their ‘ancient liberties’, dated from the Magna Carta. Hume describes a slow evolution of the ‘plan of liberty’ which eighteenth-century Britons enjoyed, with many periods of great but tolerated tyranny (under Edward III, under Elizabeth), some periods of lesser tyranny which nevertheless led to civil war and the king’s execution (the reign of Charles I), with rebellions occurring for all sorts of reasons and on all sorts of pretext, sometimes leading to improvements, sometimes to worse tyranny, sometimes to unintended advances in the direction of ‘a regular and equitable plan of liberty’. The study of English history, he wrote at the end of his discussion of the reign of Richard III, shows ‘the great mixture of accident which commonly concurs with a small ingredient of wisdom and foresight, in erecting the complicated fabric of the most perfect government’.

Social philosophy. There is virtually nothing that Hume wrote, after Book I of the*Treatise* that could not properly be classed as ‘social philosophy’. Even the *Enquiry Concerning Human Understanding*, mainly concerned with fairly ‘abstruse’ epistemological topics, keeps its eye on the social role of the epistemologist, and the social use made of, say, miracle reports. ‘Man is a sociable, no less than a reasonable being’ (*Essays*: 8), and Hume expresses the hope that even relatively abstruse philosophy may ‘diffuse itself throughout the whole society’, so that, among other effects, ‘the politician may acquire greater foresight and subtility, in the subdividing and balancing of power’ (*Essays*: 10). His essays on economics combine fairly detailed discussion of particular aspects of the then current economic policy in Britain with discussions of the highest generality about the role of money, the determinants of its value at a given time, the unimportance of what metal or non-metal is used as currency, the importance of a national debt. The *History of England* is crammed with interesting observations on such matters as the changing attitude to usury, what was being imported and exported, what taxes were being levied and with what purported authority, what role the church was playing, what the relationship was between canon law and civil law.

6 Philosophy of religion

Causes and effects of religion. Hume believes that religions, especially primitive religions, spring from the ‘trembling curiosity’ with which men, ‘agitated by hopes and fears’, scrutinize the ‘course of future causes’ affecting their life. Prominent among these fears is the fear of death and what may lie beyond it, and so it is part of Hume’s proposed cure for what he sees as the evils of ‘religion as it has been commonly found in the world’ that this fear be conquered, that he persuade us both that death is ‘annihilation’, which ‘entirely destroys this self’, and that the thought of such future annihilation need be no more repugnant than the thought that, before conception and birth, we were nothing. Hume here repeats Epicurus.

The ‘trembling curiosity’ into future causes affecting our life gets its anxious quality in part from the intensity of the hopes and fears which are involved, in part from uncertainty, in part from the sort of causes which are postulated. Religion involves ‘belief of invisible intelligent power’. ‘Invisible’ signalizes our lack of real understanding of this power; ‘intelligent’ signalizes our determination to make it comprehensible, to treat it as if it were a person, one to whom we can make petitions, who might be placated by our praises and sacrifices. It is our ‘curiosity about causes’, and its imperfect satisfaction by our empirical inquiries, which is the cognitive component of the religious impulse. It is our concern for our own welfare which provides the affective component. Religion evidences both our will to know the causes affecting our welfare, and our only partial success in discovering the determinants of our happiness and misery by natural means, let alone in controlling them.

As scientific understanding of these causal factors increases, religion might be expected to have a less vital role to play, but then, if Hume is right, religion’s role is never purely cognitive. It is our anxiety that needs a palliative, and uncertainty is only part of the cause of our anxiety. There is also our concern for our own future, and science may fail to cater to that. Hume sees the natural development of religion, once natural knowledge grows, to be a shift from polytheism to more ‘rational’ monotheism. Monotheism fits better with a more or less unified account of an orderly universe, whose regularities can be regarded as divine laws. But when one all powerful God is substituted for the many gods of more primitive religions, the reasons for fear of this God are increased, not diminished. Belief in one all-powerful God ‘is apt, when joined to superstitious terrors, to sink the human mind into the lowest submission and abasement’ (*The Natural History of Religion*: 52). What is more, different religious traditions develop slightly different versions of this one God, who becomes a jealous God, requiring his worshippers not merely to abase themselves, but to go to war against the infidel, and to burn the heretic. Hume sees monotheistic religions to be intellectually less ‘ridiculous’ than the polytheism from which they develop, but to be, morally speaking, much worse. The roots of religion are our ignorance of causes affecting our happiness, our tendency to anthropomorphism, and our desperate fears for our own future. To the extent that ignorance of causes is reduced, without any abatement of our fear of death or our infantile wish that some super-person be in charge of our fate, religion will simply adapt itself to scientific knowledge, not be banished by it. Hume’s thesis in the *Treatise*, that reason serves the passions, gets special application in the *Natural History*, where he tries to diagnose the particular passions served by theology and by religious beliefs, and finds that ‘the love of truth’ is ‘too refined’ a motive to explain such beliefs. They are not caused nor can they be cured by rational argument, however refined. If the roots of religion lie as much in our anxious passions and in our will to anthropomorphism as in our interest in causal forces at work in the world, then, to counter religion, more than science and argument will always be needed. The clever arguments put into the sceptic Philo’s mouth in the *Dialogues on Natural Religion*, and not answered by stronger counterarguments, seem in the end not to convince even Philo himself.

Argument from design. ‘The argument from design’ is put forward in the *Dialogues* by Cleanthes, a very calm and enthusiasm-free believer, who is of the opinion that ‘religion, however corrupted, is better than no religion at all’, (*Dialogues Concerning Natural Religion*: 219) and who defends the hypothesis that the universe, with the order it displays to our eyes and minds, is the work of an intelligent creator. Philo argues, against Cleanthes, that the hypothesis of an intelligent cause of the universe is only one of several that intelligent human thinkers have come up with, and has no better empirical support than the others. No hypothesis about a supposedly unique cause of a unique effect can have support of the usual inductive sort. Since the universe was not formed under our eye, all we can do is speculate and suggest analogies, taken from the ‘corner’ of the universe we have observed. We know by experience that an orderly effect (that is, one that strikes us as well-ordered) can come about in several ways. It may, like a building, have an intelligent builder as its cause. It may, like a spider’s web, be spun instinctively from the belly of an insect. It may, like a well-formed calf, have come to be by animal ‘generation’. It may, like a well

shaped turnip, have grown from seeds, by 'vegetation'. It may, like patterns in the sand on the beach, have come about by sheer chance. All these local causes of 'order' could be used as analogies to explain the order we perceive in the whole universe (or as much of it as we have any knowledge of). None of these known causes of local order are known as ultimate causes. In particular human thought is not. The builder's plans may have come into his head by observing and imitating natural order, or by copying earlier builders' work, and by cooperation with his workmates. Orderly thought itself calls for a causal explanation. Thought is often disorderly, and human designs are often botched. So our thought provides a very dubious analogy on which to model a worship-worthy universe-cause. 'What peculiar privilege has this little agitation in the brain which we call thought, that we must thus make it the model of the whole universe?' (*Dialogues Concerning Natural Religion*: 148).

Philo eventually answers his own question. Thought has privilege because the question of the cause of the universe arises only for thinkers. So 'a purpose, an intention, a design strikes everywhere the most careless, the most stupid thinker' (*Dialogues on Natural Religion*: 214). Our incurable anthropomorphism, what Hume in the *Treatise* called our mind's propensity to spread itself on external objects, ensures the privilege of thought among the many equally well- or ill-founded hypotheses about the cause of the universe. Philo's conclusion about what human reason can establish is 'one simple, though somewhat ambiguous, or at least undefined proposition, *that the cause or causes of order in the universe probably bear some remote analogy to human intelligence*' (*Dialogues on Natural Religion*: 227; original emphasis). The analogy is not said to be less remote than the others which Philo had proposed. 'Human intelligence' is undefined. It may still be being taken as a matter of agitation in the brain. And 'cause or causes' is carefully noncommital - reason cannot even establish monotheism over polytheism, let alone establish one intelligent *and just* cause of order in the universe. The remote analogy is to human intelligence, not to human benevolence or justice.

After this estimate of how little human thought at its least careless and stupid can conclude about the cause or causes of an orderly universe, and after a vivid catalogue of the 'pernicious consequences' of 'religion as it has commonly been found in the world', Philo purports to fly for alleviation of his ignorance to the revealed truths of Christianity (which, in the *Natural History*, Hume had argued was effectively polytheistic). Shortly before his dramatic flight, Philo had asked, 'When we have to do with a man, who makes a great profession of religion and devotion; has this any effect on those who pass for prudent, than to put them on their guard, lest they be cheated and deceived by him?' (*Dialogues Concerning Natural Religion*: 221). We have been put on our guard, but, as readers of Hume's *Dialogues*, we are still left in reasonable doubt about how to interpret the intentions of his characters, let alone of their author. Hume left his readers with a real enigma in the character of Philo, and, more generally, in these *Dialogues* and in the *Natural History*. As he wrote to Adam Smith when trying, shortly before his death, to arrange for the publication of the *Dialogues*, 'nothing can be more cautiously and more artfully written', and as he wrote at the end of the *Natural History*, 'the whole is a riddle, an aenigma, an inextricable mystery'.

Our prospects. In the *Natural History*, Hume's optimistic hypothesis was that 'the first religious principles must be secondary', or derivative. In some or even most conditions, human nature leads to religion, to varying religions, and so to religious zeal, religious persecution, religious wars. But religious belief and devotion are not 'so universal as to admit of no exceptions', and so do not spring from 'an original instinct', as Hume believed that, say, 'love of progeny' does. His aim was to diagnose the 'first principles' which in so many conditions had religion as their 'secondary' manifestation. Part of what we can see him to be doing in his *History of England* is studying the actual variations in religious (or irreligious) sentiment in one country's history, as a supplement to the less historical (more 'natural-historical') treatment of the varieties of religion that he gives us in the *Natural History*. His work as a scientist of human nature combined, in his lifelong attention to human religions, with his advocacy of the cause of 'the party of humankind', whom he saw to be so threatened by 'sacred zeal and rancor'. He spoke occasionally of the 'true religion'. Analogously to 'true scepticism', which turns scepticism on scepticism, this can be taken to refer to whatever benign reflection-improved form can be taken by the 'primary principles' that get their pathological secondary expression in superstition and in religious enthusiasm.

Hume is no optimist about the human condition. He is well aware of our bloodthirsty history, our record of inhumanity, and in his *History* he contributes to its recording. Where the Christians see religious devotion as the proper response to acknowledgment of the radical evil in our natures, Hume sees religion itself to be a near-inevitable evil propensity in our natures, one that increases our capacity for cruelty and inhumanity, and calls

for some secular salvation. This turning of the tables yields a perhaps over-simplified diagnosis of the main causes of human misery, but its originality, its daring, and its considerable explanatory power can scarcely be gainsaid.

List of works

Hume, D. (1875) *The Philosophical Works of David Hume*, ed. T.H. Green and T.H. Grose, London: Longman, Green, 4 vols.(At present the most complete edition of Hume's philosophical writings. It contains 'A Dialogue', and all the following works except the *History of England*, the 'Abstract' of the *Treatise*, and *The Letter from a Gentleman*. A new edition of Hume's writings, to be published by Clarendon Press, is in progress, edited by T.L. Beauchamp, D.F. Norton and M.A. Stewart.)

Hume, D. (1739-40) *A Treatise of Human Nature*, ed. L.A. Selby-Bigge and P.H. Nidditch, Oxford: Clarendon Press, 1975.(Includes the *Abstract*.)

Hume, D. (1740) *Abstract of A Treatise of Human Nature*, ed. J.M. Keynes and P. Sraffa, Cambridge: Cambridge University Press, 1938.

Hume, D. (1741-77) *Essays, Moral, Political and Literary*, ed. E.F. Miller, Indianapolis, IN: Liberty Classics, 1985.

Hume, D. (1745) *A Letter from a Gentleman to His Friend in Edinburgh: Containing Some Observations on A Specimen of the Principles Concerning Religion and Morality, said to be maintain'd in a Book lately publish'd, intituled, A Treatise of Human Nature*, ed. E.C. Mossner and J.V. Price, Edinburgh: Edinburgh University Press, 1967.

Hume, D. (1748, 1751) *Enquiries Concerning Human Understanding and Concerning the Principles of Morals*, ed. L.A. Selby-Bigge and P.H. Nidditch, Oxford: Clarendon Press, 1978.(Does not contain 'A Dialogue'. Page references in the entry given as *Enquiries* refer to the 1978 joint edition.)

Hume, D. (1754-62) *The History of England, from the Invasion of Julius Caesar to the Revolution in 1688*, Edinburgh and London, 6 vols.(Most easily obtainable now from Indianapolis, IN: Liberty Classics, 1983.)

Hume, D. (1757) *The Natural History of Religion*, ed. H.E. Root, Stanford, CA: Stanford University Press, 1957.

Hume, D. (1779) *My Own Life*, in T.H. Green and T.H. Grose (eds) *Works*, vol. 3, London: Longman, Green. (Also titled *The Life of David Hume, Written by Himself*.)

Hume, D. (1779) *Dialogues Concerning Natural Religion*, ed. N.K. Smith, London: Collier Macmillan Publishers; New York: Macmillan Publishing Company, 1947.

Hume, D. (1932) *The Letters of David Hume*, ed. J.Y.T. Greig, Oxford: Clarendon Press, 2 vols.

Hume, D. (1954) *New Letters of David Hume*, ed. R. Klibansky and E.C. Mossner, Oxford: Clarendon Press.

Humour

What is meant by saying that something is humorous or funny? It is clear that humorousness must be elucidated in terms of the characteristic response to humour, namely humorous amusement, or mirth. It is plausible to define humour in this way: for something to be humorous is for it to be disposed to elicit mirth in appropriate people through their awareness or cognition of it, and not for ulterior reasons. But this invites the question, 'What is mirth?' The three leading ideas in philosophical theories of humour are those of incongruity, superiority and relief or release. Although the perception of incongruity is often involved in finding something funny, and the resolution of a perceived incongruity plays an important role in good humour, none of these, in themselves or combined with others, is capable of capturing the concept of mirth. Mirth is not identical with the pleasurable perception of an incongruity, pleasure in feeling superior, the relief of tension or release of accumulated mental energy, or any combination of these elements. A better account of mirth is that it is a certain kind of pleasurable reaction which tends to issue in laughter if the reaction is sufficiently intense. So something is funny if it in itself pleases appropriate people through being grasped, where the pleasure is of the sort that leads, though not inevitably, to laughter.

1 The main question

What is humour? Or alternatively, what makes something funny? This basic query can be interpreted as a call for either conceptual elucidation or causal explanation. Taken the first way, the question asks, 'What does it mean to say, or what are the truth conditions of saying, that a given item is humorous or funny?' In other words, how is 'humorous' or 'funny' to be defined in a philosophically rigorous fashion? Taken the second way, the question becomes, 'What is it about a humorous or funny item that is responsible for its being humorous or funny?' On the first construal, we seek to understand exactly when something counts as humorous; on the second, we seek to ascertain in virtue of what a given item succeeds in being humorous. These questions have not been sharply separated in traditional theories, which sometimes seem concerned to address the one and sometimes the other. Whether in the last analysis the questions *can* be sharply separated, though, is not entirely clear. Ultimately it comes down to asking whether the identifying response to humorousness can itself be identified without specifying what occasions it, either externally, in terms of features of the occasioning item, or internally, in terms of features of the subject's representation of the item. This identifying response is usually labelled 'amusement', but 'amusement' is here to be understood in its specifically humour-related sense, and not in the sense of general entertainment or diversion.

Although the basic query has here been formulated in the objective mode - that is, it asks what it is for something to *be* humorous - there is, perhaps, the prior question, in the subjective mode, of what it is for someone to *find* something humorous. These, however, can be plausibly related as follows: something is humorous if and only if it is found humorous by appropriate (or intended) audiences under favourable conditions, including cognitive, attitudinal and emotional ones. The context should make clear under which of these modes the basic question is being pursued at a given point. Some objectivity about humour - some degree of true-or-false-ness in the attributions of humour - is presupposed in considering the question in the objective mode, but this appears to be justified: items are regularly and sustainedly classified as humorous, and not just as humorous to a particular person on a particular occasion. Humour, though patently a response-dependent phenomenon, seems to have at least as much objectivity as, for example, the properties of beauty or virtue.

2 Traditional theories of humour

There are three main philosophical traditions of accounting for humour: the incongruity tradition, the superiority tradition and the relief or release tradition.

The hallmark of incongruity theory is that it locates the humorous in some incongruity presented by or perceived in some item. The humorous item may be itself incongruous, relative to some assumed other object, or it may involve or contain incongruity. There have been various interpretations of the incongruity of items or elements, ranging from logical impossibility or paradoxicality, to absurdity and irrelevance, to unexpectedness and general inappropriateness.

Incongruity theorists include Schopenhauer, Hazlitt, Kierkegaard, A. Koestler, D.H. Monro and perhaps Kant. Kant held the humorous to consist in 'the sudden transformation of a strained expectation into nothing' (1790). The incongruity here, if any, is between the expectation, or what it points towards, and its deflation, or what it issues in. Schopenhauer gave incongruity theory a clearer, perhaps canonical, formulation: the essence of the ludicrous, he claimed, lies in the incongruity between concepts, the vehicles of abstract thought, and concrete objects, apprehended in perception, when the incongruity is grasped of a sudden. The mismatch of thought and perception can appear from either of two directions: a single concept can be applied to two very different objects, which only awkwardly encompasses them both ('wit'), or two objects originally ranged under a given concept can be subsequently realized to be fundamentally disparate ('folly'). Koestler's version of incongruity theory, a descendant and elaboration ofSchopenhauer's, holds that humour arises from the bisociation (double association) of an item in respect of two different and incompatible reference frames or interpretive matrices at once.

Recent incongruity theorists have generally held the perception of incongruity to be the core of the response to something as humorous, but not the whole of it. Perceived incongruity is taken as necessary, but not sufficient, for the occurrence of humorous amusement, and the reasons for this are manifest. Incongruity is on the face of it an undesirable property and its confrontation usually fails to elicit pleasure straightforwardly; anxiety or bewilderment, or at best curiosity, are more likely to result. In addition, not all pleasure taken in incongruity appears to constitute amusement, as opposed to aesthetic or other forms of satisfaction.

What more, then, is required? Some theorists hold that the perceived incongruity must be enjoyed for its own sake, some that it must be enjoyed as such but not aesthetically, some that it must not give rise to negative emotions (such as fear or disgust), some that it not engage practical concerns (as for knowledge or safety), and some that it must have a tendency to issue in laughter. Some stress the temporal structure needed for perceived incongruity to be found humorous, while others insist it is not perceived incongruity itself that is the source of amusement, but only the consequent resolution of such incongruity. Still others underline the fulfilment of background conditions, such as being in fun, or the absence of egoistic or sympathetic concern for the object of humour.

Nevertheless, we may be justifiably sceptical of the claim that all intuitively accountable instances of humour, for example, mimicry, satire, sarcasm, slapstick or sexual ribaldry, turn on the perception of incongruity. It has not been demonstrated that properties other than incongruity cannot sensibly figure as what one is explicitly amused by. Thus, doubt remains over whether the incongruity theory, however qualified or supplemented, can be correct as a conceptual elucidation of humour.

Superiority theorists, who include Aristotle, Thomas Hobbes, Alexander Bain and Henri Bergson (§6), construe humour as rooted in the subject's awareness of superiority, in some respect, to the humorous object. Hobbes famously declared humorous laughter to be the result of a 'sudden glory' in one's eminence or fortune, in contrast with another or one's former self. Bergson (1899) theorized the comic as essentially 'the encrustation of the mechanical on the living' - a falling-off from the human ideal of flexibility, suppleness and accommodation. The observer of this, for Bergson, accordingly feels superior, takes pleasure in so feeling, and manifests their pleasure naturally in laughter at the imperfectly human. Comedy and emotion are held to be incompatible, since comic engagement by its very nature short-circuits emotional involvement. In addition,Bergson maintains that comic laughter is a social corrective that chastises and hopefully reforms the socially undesirable rigid behaviour at which it is directed.

Spencer and Freud, the most well-known relief theorists, locate the essence of the humorous in the relief from psychic constraint or the release of accumulated mental energy that it affords (see Freud §4). Spencer (1911) felt it important to investigate not only the features of humour, but why it is specifically laughter that humour induces, thus necessitating a physiological explanation. The explanation he offers emphasizes nervous tension and its bodily manifestation when suddenly excessive or redundant.Freud's striking account of the pleasure taken in jokes, influenced bySpencer's, is well worked out, as is his extensive typology of jokes in terms of their structures and techniques. Freud (1905) viewed the enjoyment of jokes as rooted in an economy of psychic energy, namely, that of inhibition or repression. With innocent jokes, the inhibition is against nonsense and pure play, while with tendentious jokes, the inhibition is against a display of aggression or sexuality, but in both cases the energy of inhibition thus freed up manifests itself as pleasure.

Whatever truth they contain, superiority and release theories lack the generality of incongruity theory. In addition,

they seem more concerned with concomitants or mechanisms of the humorous reaction than with its conceptual core. Thus these competitors of incongruity theory are currently seen as even less able to provide an adequate answer to the basic question.

The above classification of theorists involves a good deal of oversimplification, for strands of each of the three guiding traditions of reflection on humour can be uncovered in almost every major theorist. Thus, Kant might just as easily be called a relief theorist as an incongruity theorist, in virtue of the stress he placed on the animation of the body through the quick release of tension built up in expectation of what does not arrive. Bergson could justifiably be classified as an incongruity theorist rather than a superiority theorist. The incongruity that defines the comic in his analysis is posited between a human or human-like being and various quintessentially anti-human automatisms and rigidities with which they are afflicted. Schopenhauer's account (1844), though obviously bringing incongruity to the fore, also includes a strain of superiority theory; for Schopenhauer, the phenomenon of humour exemplifies an important truth that we have independent reasons for acknowledging, namely, the superiority of perceptual to conceptual modes of knowing the world. Part of our pleasure in humour is in direct consequence of its affirmation of this truth. Spencer's account, which conceives the humorous reaction as a sudden release of nervous energy, also posits that this results from a 'descending incongruity', in a manner reminiscent of Kant. Koestler's account (1964), borrowing from Spencer, combines the postulation of a collision of incompatible frames or matrices - a form of the incongruity idea - with the notion of an emotional mass and its explosive diversion as laughter when deserted by thought, in the tradition of release theories.

3 The analysis of humour

A number of considerations must be borne in mind when formulating an adequate analysis of humour, that is, an answer to the question 'What is humour?' construed conceptually. Most of these concern the proper relationship of humour to other phenomena, such as laughter, emotion, pleasure and aesthetic appreciation. First, humour and laughter are not coextensive, that is, not all laughter, by any means, is occasioned by humour. Laughter can result from, among other things, tickling, nitrous oxide, organic disorder, joy, embarrassment or vengeful exultation. Second, not all humour is productive of laughter, even in appropriate subjects; humour may engender amusement without any behavioural manifestation, or with only the lesser one of smiling. Third, humour does not always produce amusement, its characteristic pleasure, even in appropriate subjects; certain background conditions of mood or psychic preparedness also need to be met. Fourth, humour seems to have both a cognitive and an affective component, which are bound up together in the response.

It might be thought that incongruity theory is clearly aimed at answering the conceptual query, while release theory is clearly aimed at the causal one: noticing incongruity at least appears explicative of what finding something funny consists in, whereas the release of tension seems to concern the mechanism whereby finding something funny generates pleasure or some other effect. Perceived incongruity is a plausible intentional object of amusement - what it is directed upon - while release of tension is not.

But what of superiority theory? Though one is surely not amused at a quick release of nervous energy, it seems not impossible that one might be amused at one's evident superiority to some less fortunate person, when it is suddenly noted, in addition to or as opposed to whatever incongruity such misfortune may present. It is not clear that the pleasure I take in someone's accidentally slipping on a banana skin without serious harm cannot be accounted part of humorous enjoyment as such, but only as something distinct. It is not clear that an item's reinforcement of one's good fortune, or its deflation of expectations, or its presentation of ambiguity, or its surprisingness, or its strangeness, or some other more specific property, cannot itself be what is relished, and even the whole of what is relished, in certain cases of amusement. If so, then it may be a mistake to regard perceived incongruity as conceptually requisite to humorousness.

Hence there seem to be two choices for proceeding with the analysis. On one hand, if all cases of humour can be demonstrated to involve perceived incongruity, and to do so non-accidentally, then perceived incongruity should figure in an elucidation of the notion of humour, with apparent cases of humour without incongruity being shown to be cases either of non-humour or of humour in which non-humorous pleasure, derived from other sources, overshadows what proper humour-pleasure is present. On the other hand, if apparent cases of humour without incongruity are to be accepted as genuine instances of humour, then an analysis is needed which elucidates humour without reference to perceived incongruity. Perhaps the only plausible way of doing so would be in terms of a

distinctive and recognizable effect on perceivers and one arising through cognition of the item in question. On such a perspective, apparent incongruity would be the most common, but not the necessary, focus of humorousness; other properties might so figure, on other occasions.

Suppose, believing that even incongruity theory unjustifiably limits the possible objects of amusement, we begin with this general idea: the humorous is that which makes one laugh by thinking or perceiving it. Then a natural refinement would be as follows: an item x is humorous (or funny) if and only if x has the disposition to elicit, through mere cognition of it, and not for ulterior reasons, a certain kind of pleasurable reaction in appropriate subjects generally (that is, informationally, attitudinally and emotionally prepared subjects), where this pleasurable reaction (amusement or mirth) is identified by its own disposition to induce, at moderate or higher degrees, a further phenomenon, namely, laughter. Thus described, the humorous cannot be detached from all felt inclination, however faint, toward the convulsive bodily expression we call laughing. The propensity of the state of amusement to issue in laughter is arguably what is essential to its identity, and underpins the widespread intuition that humour and laughter, though not coextensive, are nevertheless intimately related. The connection between amusement and laughter, then, would be this: the mental state of amusement is partly identified by its disposition (universal in humans, if ultimately contingent) to issue in laughter if sufficiently intense.

What of the idea that amusement is not amusement unless it both arises in a certain way and has a certain intentionality? The present analysis acknowledges this in its own fashion, for it entails that a reaction to x is not amusement unless, in addition to being pleasurable and characteristically leading to laughter, it comes about in virtue of cognition of x, and is also directed on x. However, *pace* certain theorists, such asClark (1970), amusement may not have a formal object - a description under which an object must be seen if it is to amuse - beyond the minimal ‘that which is amusing’.

‘What makes x funny?’, when taken as a question about why speakers count x as funny, is directly answered by such an analysis. Roughly, x is funny in that, or because, the cognition of x amuses people with an appropriate mental set, that is, pleases them in such a way that they have some inclination to laugh at x. But ‘What makes x funny?’, taken as a question regarding what it is about x that underwrites or contributes to its being funny or eliciting amusement, can be answered only by empirical investigation or reflective survey. There may be many factors that enter into the explanation of an item’s possessing the power of humorousness, though we can be confident that presenting appearances of incongruity will figure largely among them.

It may then be useful to recognize two analyses of humorousness: one ‘thin’, one ‘thick’. The ‘thinner’ analysis, which we have just been sketching, denies there is any necessary focus or intentional object of humour, and holds an item’s humorousness to be merely its power to raise via cognition a certain pleasurable effect, identified through its connection with laughter, in appropriate subjects. The ‘thicker’ analysis assumes that all cases of humour can be shown conceptually to involve the perception of incongruity, and so adds that to the specification of the thought through which a humorous item must cause a pleasurable effect or produce enjoyment. But as we have seen, adopting an analysis of that sort runs the danger of prematurely foreclosing on the possible objects of amusement, a reaction that may well be characterizable without recourse to a focus on incongruity.

4 Incongruity reconsidered

Even if incongruity is not a necessary condition or component of humorousness, no account of humour can fail to accord it a special status. Beyond being the most common focus of humour, its special status may consist in the following. First, there is reason to think that superior forms of humour - those which are most satisfying, intellectually and emotionally - all rely on incongruity in one way or another. Second, there may be categories of humour (jokes, for instance) that are inconceivable in the absence of incongruity, even if there are categories (farce, perhaps) that have another basis. Third, the quality of incongruity-based humour may be tied to a further feature, one obviously presupposing such incongruity, namely, the nature and extent of the resolution of the incongruity that the humorous item embodies or presents.

The pleasure afforded by incongruity-based humour characteristically seems to require that the apparent incongruity be in some sense *resolved* by the subject. Such resolution can be an object of conscious awareness on the subject’s part, and can take various forms, including justification, rationalization, unification, or dissolution, but is perhaps best understood as the *grasping* of the rationale of the incongruity the humorous item presents. The

appreciation of incongruity-based humour can be likened to the solution of a puzzle, though a puzzle where insight is attained in a relatively immediate and effortless way. The resolution of a joke's incongruity is easily related to or identified with the experience known as 'getting' the joke. In good incongruity humour - a clever pun, for example - one is made to see the 'why' of the incongruity in addition to the 'what'.

The idea of grasping the incongruity in an instance of humour might be taken further: to resolve the incongruity in an item of humour and thus to be in a position to appreciate its humorousness is to grasp the basis of the incongruity involved, and, at the same time, an aspect of congruity as well often residing in the humorous vehicle itself. Without such a double grasp, of both the 'fit' and the 'non-fit' involved in a piece of humour, amusement of a high order is unlikely. Good incongruity-humour offers 'the pleasure of finding connections where none were thought to exist' (Monro 1951).

We may thus propose that model instances of incongruity-humour involve an underlying unification of their disparate contents, a tying together in the humorous vehicle of incongruous elements, rather than just their brute juxtaposition. In other words, the best such humour always has a pivot on which the humour turns, which rationalizes the apparently incongruous elements that have been brought together.

5 Other issues

Other issues of philosophic interest involving humour include: the status of amusement *vis-à-vis* emotion; the relation of humour and aesthetic experience; the relation between producing and consuming humour; the role or use of humour in human life; the nature of the sense of humour; the distinctive features of jokes; humour and society; humour and seriousness; humour and creativity; the ethics of humour.

Hungary, philosophy in

The situation of Hungarian philosophy can be best illustrated by two sayings: 'there are Hungarian philosophers, but there is no Hungarian philosophy', and 'a certain period of Hungarian philosophy stretches from Descartes to Kant'. The two ideas are closely connected. Thus on the one hand, there is such a thing as Hungarian philosophy: there are scientific-educational institutions in philosophical life and there are philosophers working in these institutions. On the other hand, there is no such thing as Hungarian philosophy: it is a history of adoption, largely consisting of attempts to introduce and embrace the great trends of Western thought.

After some preliminaries in the medieval and early-modern periods, Hungarian philosophy started to develop at the beginning of the nineteenth century. As a result of the reception of German idealism - the so-called Kant debate and Hegel debate - the problems of philosophy were formulated as independent problems for the first time, and a philosophical language began to evolve. After an attempt to create a 'national philosophy' - and after some outstanding individual achievements - the institutionalization of Hungarian philosophy accelerated at the end of the century. The early years of the twentieth century brought the first heyday of philosophy to Hungary, with the rapid reception of new idealist trends and notable original contributions. In the period between the two wars the development stopped: many philosophers were forced to emigrate, and Geistesgeschichte *(the history of thought) became prevalent in philosophical life. Following the communist take-over, the institutions of 'bourgeois' philosophy were eliminated, and Marxism-Leninism, which legitimated political power, took a monopolistic position. During this period, the only significant works created were in the tradition of critical Marxism and philosophical opposition. The changes in 1989 regenerated the institutional system, and the articulation of international contemporary trends - analytic philosophy, hermeneutic tradition and postmodernism - came to the fore.*

Besides some works by thinkers in exile, Hungarian philosophy has produced only one achievement which can be considered significant at an international level: the oeuvre *of György (Georg) Lukács.*

1 The beginnings

The origins of Hungarian philosophical thinking can be traced back to the Middle Ages. The products of the Latin-speaking culture of the age were defined by scholasticism. Following a number of anonymous or insignificant authors, the only important and influential thinker appeared on the scene in the fifteenth century: Pelbárt Temesvári, Franciscan theologian, was a philosopher of European standard, representative of the medieval spirit. His collection of sermons, containing drafts of speeches, based on the strict logical order of the scholastic division-system and illustrated by literary stories, became highly popular both within and outside the country.

In the Hungarian history of ideas, the influence of scholasticism continues well beyond the Middle Ages: it was the predominant philosophy until the nineteenth century, taught in Catholic high-schools. The effects of the different trends of Renaissance, Enlightenment and German Idealism found their place within this tradition (see Renaissance philosophy; Enlightenment, Continental; German idealism).

The author of the first Hungarian philosophical work, János Apáczai Csere, was the most prominent among the Protestant students who had been educated at Western universities. His main work, the *Magyar encyclopaedia (Hungarian Encyclopedia)* (1655) printed in Utrecht, summarizes the scholarship of the age for the school curriculum. Its significance for cultural history comes from the fact that this was the first work to expound the ideas of the time (through Cartesian epistemology) in Hungarian. Apáczai's attempt, however, did not have followers and Hungarian philosophy showed no notable development for another hundred years.

2 Debates and achievements

After these sporadic and isolated preliminaries, real development was initiated at the beginning of nineteenth century. The starting point was the reception of German Idealism, with the two debates spanning through the first half of the century: the Kant and the Hegel debates (see Kant, I.; Hegelianism).

The two important features of the Kant debate were the lack of an autonomous philosophical milieu on the one hand, and the reductive character of the Kant interpretation on the other. The debate of Protestant ministers - who

had visited German universities and become acquainted with Kantianism - was a philosophical debate at a time when no philosophical life was to be found. The reception of philosophical thought, therefore, lacked an independent sphere, and its treatment was defined by different - mainly moral and political - dimensions. Kantians saw Kant as a supporter of religion, morals and political status quo; anti-Kantians viewed his work as an attack on these. Accordingly, the discussion was seriously deformed: Kant's *oeuvre* was reduced to ethical-theological aspects. The fact that the epistemological and logical aspects of the critical philosophy took precedence over the ethical-ideological aspects both genetically and structurally was hardly acknowledged.

The Hegel debate was also mainly conducted by Protestant ministers, but was effected less by denominational characteristics. Its driving force was the awakening of national spirit, typical of the early romantic age, whose main purpose was to promote scholarship - including philosophizing - in the national language. The Hegelian participants of the debate attempted to introduce the most influential contemporary philosophy, namely Hegelianism, to Hungary; the anti-Hegelians, however, judged the abstract Hegelian system of categories to be alien to the national spirit. The discussion had a dual result. On the one hand, this was the first time that a philosophical debate gained broader publicity: following articles in literary journals, Hegelianism became a widespread topic of discussion. On the other hand, the discussion initiated a considerable development in Hungarian philosophical language as the translation of Hegelian terms contributed to the establishment of Hungarian philosophical terminology.

The Hegel debate forms the background to the evolution of the so-called 'reconciliation' school of philosophy, which had a dominant role from the late 1830s until the mid-1850s. The school set itself the task of creating a characteristically Hungarian 'national philosophy'. Although its representatives took sides against German Idealism, their philosophy was in fact nothing but the adoption of ideas of some German thinkers - mainly those of Krug and Fries, who interpreted Kant from an empirical-psychological point of view. The significance of the eclectic, rather low-level reconciliation school is to be found not so much in its intellectual contribution as in its culture-founding role. Following the example of the conventional school, the next century brought several more attempts to create a 'national philosophy' as an answer to the challenge which arose from the consciousness of both national and philosophical underdevelopment.

Around the middle of the century, two thinkers did significant work. János Erdélyi, aesthete and littérateur, represented Hegelianism on the *niveau* of the age. His polemical treatise, *A hazai bölcsészet jelene (The Present State of Domestic Philosophy)* (1857) criticizes the national philosophy of the reconciliation school by appealing to the universal character of philosophy. His monograph about the early history of Hungarian philosophy has been the most useful summary on the topic ever since. Writer and politician József Eötvös's reflections on liberal ideas yielded quite modern insights in contemporary terms. His monograph, *Der Einfluß der herrschenden Ideen des 19. Jahrhunderts auf den Staat (The Influence of the Predominant Ideas of the Nineteenth Century on the State)* (1851-4) (published originally in German), analysed the concepts of liberty, equality and nationality in sociological terms, and thereby became one of the first manifestations of a conservative reinterpretation of liberalism (see Equality; Freedom and liberty; Liberalism; Nations and nationalism).

3 The establishment and functioning of the institutional system

The full development of the institutional system of Hungarian philosophy started in the last third of the nineteenth century. The infrastructure of philosophizing became consolidated, and philosophy secured an autonomous position within intellectual life.

Bernát Alexander, a prominent figure of the turn of the century, played a major role in this process. The author of some eclectic works in the history of philosophy, psychology, aesthetics and literary studies, using mainly elements of positivism and Neo-Kantianism (see Neo-Kantianism), his significance is due to his activity as organizer of philosophical life. He had a considerable influence as a teacher, an editor and publicist, and he translated many works into Hungarian. He was the editor of the series called 'Collection of Philosophical Writers', published in twenty-nine volumes between 1881 and 1919 by the Hungarian Academy of Science. This series played a fundamental role in spreading philosophical scholarship in Hungary: for the first time, many classics of the history of philosophy - including the works of Plato and Aristotle, Bruno, Descartes, Pascal, Spinoza, Hume, Diderot and Kant - were published in Hungarian, and some of these translations are still in use today.

The first Hungarian philosophical periodical was the *Magyar Philosophiai Szemle (Hungarian Philosophical Review)*, founded in 1882; from 1892, it was replaced by *Athenaeum*. The Hungarian Philosophical Society was founded in 1901, first as an opposition to official philosophical scholarship, then becoming a part of the status quo.

Supported by the institutional bases, a significant flowering occurred in philosophy at the beginning of the twentieth century, and especially after 1910: this was the first heyday of Hungarian philosophy. The somewhat late positivist orientation was followed by the reception of various directions of new idealism. Axiological Neo-Kantianism, Diltheyian philosophy of life, Bolzano's logic, Husserlian phenomenology and Meinongian theory of objects all soon found supporters (see Dilthey, W.; Bolzano, B.; Husserl, E.; Meinong, A.). Two groups played a determining role in introducing the new idealist paradigm: the Böhm-students around the turn of century, and the Lukács-circle in the 1910s. Károly Böhm first tried to find a compromise between positivism and Neo-Kantianism, then worked on an axiology-based philosophy, akin to the efforts of the Baden school of Neo-Kantianism. His students at Kolozsvár - members of the 'Transylvanian School' - exemplified a specifically Hungarian branch of Neo-Kantianism. The young Lukács, with his short-lived journal *A Szellem (The Spirit)* and his intellectual group, the Sunday Circle, represented an ethical idealism embedded in a partly Kantian, partly philosophy-of-life-based conceptual framework (see Lukács, G.). Some members of the Circle subsequently emigrated from Hungary and made a name for themselves, such as art historian Frigyes Antal, art sociologist Arnold Hauser, and the founder of sociology of knowledge, Károly (Karl) Mannheim. The intellectual prosperity of the beginning of the century formed the background of the early intellectual development of both the philosopher of economics Károly (Karl) Polányi and the philosopher of science Mihály (Michael) Polányi (see Polányi, M.).

After the First World War and the revolution, development stopped. Many figures who had been important at the beginning of the century were forced to emigrate. The most significant character between the two wars was Ákos Pauler. Beginning as a positivist, then embracing the different tendencies of new idealism, Pauler built a system that reflected the Platonism of pure logic. His works - the two most important being the *Bevezetés a filozífiába (Introduction to Philosophy)* (1920) and *Logika (Logic)* (1925) - still breathe an air of cold perfection, but they were considered somewhat anachronistic even in their time.

The dominant trend of the period was the *Geistesgeschichte* approach which transformed new idealism into philosophy of history and culture. Its most prominent representative, Lajos Prohászka, combined this direction with neo-Hegelianism. His work on national characterology *A vándor és a bujdosó (The Wanderer and the Exile)* (1934), born under German influences, became the major philosophical bestseller of the age. Beside the broadly interpreted *Geistesgeschichte* tendency, all other schools lacked influence: this was the case with Neo-Kantianism, which had gradually lost ground, as well as with German existentialism, which occasionally appeared in Hungary.

4 Decades of communism

Following the few years of democratic digression immediately after the end of the Second World War, Hungary was ruled by communist regimes for about four decades. This essentially determined the institutional system, the dominant direction and the achievements of Hungarian philosophy.

The institutional system underwent a radical transformation. The traditional 'bourgeois' institutions of philosophy were closed. The Hungarian Philosophical Society fell apart, and the publication of *Athenaeum* stopped. The institutional field of philosophical activity was provided by the system of Marxism-Leninism departments (a compulsory subject at all universities), and by the Philosophical Institute founded within the Hungarian Academy of Sciences (see Marx, K.; Dialectical materialism; Marxism, Western). The only periodical which was devoted entirely to philosophical scholarship was the *Magyar Filozófiai Szemle (Hungarian Philosophical Review)* (started in 1957). The philosophical life which developed within the institutional system was usually at a very low level, was imbued with ideology, and yet functioned with shared subjects, a set terminology and a unified audience.

The dominant philosophical trend was Soviet-Marxism, which commanded a monopolistic position at the beginning of the period but lost force after 1956 in the post-Stalinist period (see Marxist philosophy, Russian and Soviet). As for its function, this was the ideology that served as legitimization of political power. Its tenets were to refer to the works of Marx and Engels, and were called 'scientific'; any criticism of the official worldview was

condemned as ‘revisionist’ or ‘anti-scientific’. It consisted of two parts: dialectical materialism - the ontology providing cosmology and natural philosophy; and historical materialism, the history of philosophy yielding a teleological explanation of history.

In this period, there were considerable philosophical accomplishments, but mainly on the margins and outside official philosophy. The former case is exemplified by the activity of the Budapest School, which formed around the later György Lukács. The critical Marxist group’s watchword was ‘the renaissance of Marxism’, announced by Lukács in the 1960s (see Lukács, G.). They produced notable works which, however, eventually resulted not so much in the renewal, but rather in the deconstruction of Marxism. Of the circle, Ágnes Heller published ethical works; Ferenc Fehér wrote aesthetic studies; György Márkus attempted to introduce analytic philosophy and expounded the notion of human essence in the works of the young Marx; and Mihály Vajda worked on the Marxist reception of phenomenology and on an analysis of fascist movements. The book *Hogyan lehetséges kritikai gazdaságtan? (How Can Critical Economics be Possible?)* (1970-72) - written by Márkus with his students, György Bence and János Kis and not published at the time - criticizes the foundations of Marxian socialism. Another book, *Dictatorship over Needs* (1981), co-authored by Márkus, Heller and Fehér after their emigration, provides a critical Marxist explanatory theory of Soviet socialism. The philosopher of science Imre Lakatos who became famous after his emigration, was also a member of the circle for some time. Two works outside official philosophy deserve mention. Political thinker István Bibó attempted to reconcile liberalism and socialism (see Socialism). He was generally condemned to silence, but at the time of the postcommunist transition his writings served as the most influential ideological reference. The philosopher Béla Hamvas, who started with a philosophy of crisis and ended up with a new sacral metaphysics, also relied on oriental traditions. His enigmatic essays, published years after they had been written, were a major inspiration to literary philosophical essay-writing.

5 After 1989

As far as philosophy is concerned, the changes of 1989 were preceded by earlier developments. In the last decade, the dominance of Marxist-Leninist philosophy became merely apparent. There was no opportunity for open criticism of official ideology, but members of the philosophical elite all joined contemporary Western trends. The significance of the changes in 1989 is due to the fact that these endeavours could become public within the new institutional system.

During the 1980s, ideological research was no longer compulsory in the Institute of Philosophy, and the Institute finally became a place for ideology-free philosophizing in official terms. In 1987, the social organization for philosophy, the Hungarian Philosophical Society, was reorganized. Since 1989, Marxism-Leninism has not been a compulsory subject at the universities; the departments that had earlier taught dialectic and historical materialism here started to give courses on the history of philosophy, introductions to philosophy and applied philosophy adjusted to the profile of their university. The publication of philosophical periodicals also was revitalized. About a dozen new philosophy-oriented periodicals were founded, the most important of which being the *Athenaeum*, which contains collections of translations on given topics and *Gond*, which publishes philosophical essays. To compensate for the loss of several years a number of new editions of older translations have been published, together with new translations of classic and contemporary works and the writings of Hungarian authors blacklisted for ideological and political reasons. Following the renewal in the institutional system, there has been a renaissance in philosophy: philosophy seems to have become a significant area of contemporary Hungarian intellectual life.

The three most important schools in the country today appear to be analytic philosophy, hermeneutics and the postmodern approach (see Analytic philosophy; Hermeneutics; Postmodernism). Scholars of analytic philosophy are interested in the philosophy of language, the philosophy of science and the history of philosophy. They are primarily influenced by Wittgenstein and Kuhn. Those who work in the hermeneutic tradition are mainly attached to Heidegger, and to Gadamer in aesthetic research. The most prominent representatives of postmodernism are members of the former Budapest School who returned from external or internal emigration, and (following some US and French examples) renewed the tradition of philosophical essay-writing. The rediscovery of a Hungarian philosophical tradition is an important element of this philosophical renaissance.

Hus, Jan (*c*.1369-1415)

From his appointment as rector of the Bethlehem chapel in Prague in 1402 until his execution at the Council of Constance in 1415, Jan Hus advanced the goals of an ecclesiastical reform movement with Czech national overtones. Hus' ministerial and academic posts provided a broad platform for his leadership. He preached tenaciously against clerical abuses. At the University of Prague he taught philosophical and ecclesiological doctrines which, his opponents charged, were taken from the radical Oxford reformer, John Wyclif. Whereas Wyclif's philosophical realism (for example, the indestructibility of 'being', led him to adopt several positions, condemned as heretical, Hus' polemic, in which he castigated the fiscalization and bureaucratization of the papacy, sprang more from his ideals of evangelical minority and apostolic poverty.

Hus came from Husinec in southern Bohemia. He was trained at the University of Prague, earning his BA in 1393 and his MA in 1396. Divisions in the university faculty ran along national origins, German and Czech, and were reflected in schools of philosophy. Hus sided with his compatriots who adhered to the realism of Wyclif as opposed to the nominalism embraced by the German counterparts. Along with his teaching duties, Hus preached in the large Bethlehem chapel. He followed in the footsteps of John Milic of Kromeríz and Matthew of Janov, forerunners of the Czech reform effort, committed to the reformation of the church according to the ideal of the early apostolic community.

The conflict between the faculties escalated into denunciations of heresy. Accused of Wycliffite errors, Hus and his fellow Czech academics responded by overturning the university voting procedure which had favoured the German students. After King Wenceslaus IV of Bohemia confirmed this reversal by mandate in 1409, the Germans left *en masse* for other German universities, where they continued to challenge the 'Wycliffites' by seeking their condemnation at the imperial court and the Roman Curia. Moreover, Hus encountered stiff resistance from the indigenous clerical hierarchy, stung by his strident accusations of careerism and moral laxity. Ultimately, he broke with the archbishop of Prague, Zbynek Zajíc, over the papal election at the Council of Pisa in 1409. The archbishop, although at first sympathetic to reform, maintained obedience to Pope Gregory XII of Rome, while Hus supported the newly elected Alexander Zbynek; in return the Pisan pope decreed that preaching cease in all Prague chapels. Hus ignored the pope's prohibition; even more, he publicly defended condemned articles of Wyclif. Outraged at Hus' defiance, Zbynek declared him excommunicate.

Hus alienated King Wenceslaus when Alexander's successor, John XXIII, called for a crusade in 1411 against the supporters of Gregory XII. The campaign was to be financed by the sale of indulgences, the profits of which Wenceslaus shared. Hus decried the crusade as fratricide; the King withdrew his protection for Hus. Meanwhile, Hus' antagonists at the Pisan curia secured papal excommunication against him, extended by an interdict on Prague.

In deference to his sovereign, Hus left the city in 1412 and found refuge among nobles in southern Bohemia. From there he defended his position in Latin and Czech treatises, the most important titled *Tractatus de ecclesia (On the Church)*. Like Wyclif before him, Hus defines the universal Church as the 'totality of the predestined'. The Church on earth consists of the elect and those foreknown by God to be damned. This militant Church includes the Roman church with the pope and the cardinals who form 'the chief part of its dignity', provided they adhere to Christ's example. Hus rejects papal claims to headship; Christ alone remains head of the Church. Anyone not prepared to follow Christ in word and deed is a 'disciple of the Antichrist'.

When summoned to appear before the general council at Constance (1414-18), Hus received from the emperor Sigismund a guarantee of safe conduct to and from Constance. Instead of being allowed to present his case, Hus was imprisoned. Confronted with a series of loose quotes, deemed Wycliffite, that were gleaned from his works, Hus responded that he would abandon any position if it could be proven heretical on the basis of the Scriptures. Herein lay the main cause for his condemnation: Hus repudiated all pronouncements, either papalist or conciliarist, formulated without scriptural foundation. Refusing to recant, Hus was burned as a heretic on 6 July 1415. His death rallied his Czech countrymen and ignited a broad-based reform movement. Its conservative wing wrested major concessions from the Council of Basel in 1431-49, which were acknowledged in the Compacts of Prague (1436).

Husserl, Edmund (1859-1938)

Through his creation of phenomenology, Edmund Husserl was one of the most influential philosophers of our century. He was decisive for most of contemporary continental philosophy, and he anticipated many issues and views in the recent philosophy of mind and cognitive science. However, his works were not reader-friendly, and he is more talked about than read.

Husserl was born in Moravia, received a Ph.D. in mathematics while working with Weierstraß, and then turned to philosophy under the influence of Franz Brentano. He was particularly engaged by Brentano's view on intentionality and developed it further into what was to become phenomenology. His first phenomenological work was Logische Untersuchungen (Logical Investigations) (1900-1). It was followed by Ideen (Ideas) (1913), which is the first work to give a full and systematic presentation of phenomenology. Husserl's later works, notably Vorlesungen zur Phänomenologie des inneren Zeitbewusstseins (On the Phenomenology of the Consciousness of Internal Time) (1928), Formale und transzendentale Logik (Formal and Transcendental Logic) (1929), Kartesianische Meditationen (Cartesian Meditations) (1931) and Krisis der europäischen Wissenschaften und die transzendentale Phänomenologie (Crisis of the European Sciences) (partly published in 1936), remain largely within the framework of the Ideas. They take up topics that Husserl only dealt with briefly or were not even mentioned in the Ideas, such as the status of the subject, intersubjectivity, time and the lifeworld.

Brentano had characterized intentionality as a special kind of directedness upon an object. This leads to difficulties in cases of hallucination and serious misperception, where there is no object. Also, it leaves open the question of what the directedness of consciousness consists in. Husserl therefore endeavours to give a detailed analysis of those features of consciousness that make it as if of an object. The collection of all these features Husserl calls the act's 'noema'. The noema unifies the consciousness we have at a certain time into an act that is seemingly directed towards an object. The noema is hence not the object that the act is directed towards, but is the structure that makes our consciousness be as if of such an object.

The noemata are akin to Frege's 'third world' objects, that is, the meanings of linguistic expressions. According to Husserl, 'the noema is nothing but a generalization of the notion of meaning [Bedeutung] to the field of all acts' ([1913] 1950: 3, 89). Just as distinguishing between an expression's meaning and its reference enables one to account for the meaningful use of expressions that fail to refer, so, according to Husserl, can the distinction between an act's noema and its object help us overcome Brentano's problem of acts without an object.

In an act of perception the noema we can have is restricted by what goes on at our sensory surfaces, but this constraint does not narrow our possibilities down to just one. Thus in a given situation I may perceive a man, but later come to see that it was a mannequin, with a corresponding shift of noema. Such a shift of noema is always possible, corresponding to the fact that perception is always fallible. These boundary conditions, which constrain the noemata we can have, Husserl calls 'hyle'. The hyle are not objects experienced by us, but are experiences of a kind which we typically have when our sense organs are affected, but also can have in other cases, for example under the influence of fever or drugs.

In our natural attitude we are absorbed in physical objects and events and in their general features, such as their colour and shape. These general features, which can be shared by several objects, Husserl calls essences, or 'eidos' (Wesen). Essences are studied in the eidetic sciences, of which mathematics is the most highly developed. We get to them by turning our attention away from the concrete individuals and focusing on what they have in common. This change of attention Husserl calls 'the eidetic reduction', since it leads us to the eidos. However, we may also more radically leave the natural attitude altogether, put the objects we were concerned with there in brackets and instead reflect on our own consciousness and its structures. This reflection Husserl calls 'the transcendental reduction', or 'epoché'. Husserl uses the label 'the phenomenological reduction' for a combination of the eidetic and the transcendental reduction. This leads us to the phenomena studied in phenomenology, that is, primarily, the noemata.

The noemata are rich objects, with an inexhaustible pattern of components. The noema of an act contains constituents corresponding to all the features, perceived and unperceived, that we attribute to the object, and moreover constituents corresponding to features that we rarely think about and are normally not aware of,

features that are often due to our culture. All these latter features Husserl calls the 'horizon' of the act. The noema is influenced by our living together with other subjects where we mutually adapt to one another and come to conceive the world as a common world in which we all live, but experience from different perspectives. This adaptation, through empathy (Einfühlung), was extensively studied by Husserl.

Husserl emphasizes that our perspectives and anticipations are not predominantly factual: 'this world is there for me not only as a world of mere things, but also with the same immediacy as a world of values, a world of goods, a practical world' ([1913] 1950: 3, 1, 58). Further, the anticipations are not merely beliefs - about factual properties, value properties and functional features - but they also involve our bodily habits and skills.

The world in which we find ourselves living, with its open horizon of objects, values, and other features, Husserl calls the 'lifeworld'. It was the main theme of his last major work, The Crisis of the European Sciences, of which a part was published in 1936. The lifeworld plays an important role in his view on justification, which anticipates ideas of Goodman and Rawls.

1 Life

Edmund Gustav Albrecht Husserl was born of Jewish parents in Prossnitz (now Prostejov in the Czech Republic) in Moravia, in what was then Austria-Hungary on 8 April 1859. He was thus of the same age as Dewey and Bergson.

Husserl's early interests lay in the direction of mathematics and science. In 1876 he began studying mathematics and astronomy at the University of Leipzig. After three semesters he transferred to the University of Berlin in order to study with Weierstraß, Kronecker and Kummer, a trio that made Berlin a centre in the mathematical world during that period. After three years in Berlin he left for Vienna, where he received his doctorate in January 1883. He then returned to Berlin in order to become an assistant for Weierstraß. However, Weierstraß became ill, and after just one semester in Berlin Husserl entered military service for a year, spending most of it in Vienna. A growing interest in religious questions made him decide in 1884 to study philosophy with Franz Brentano in Vienna, who inspired him to go into philosophy full-time and exerted a decisive influence on his later phenomenology.

Husserl studied with Brentano until 1886, when Brentano advised him to go to Halle, where one of Brentano's earlier students, Carl Stumpf, was teaching philosophy and psychology. Husserl habilitated in Halle in 1887 and remained there as a *Privatdozent* until 1901, when he became Associate Professor (*außerordentlicher Professor*) in Göttingen, and in 1906 Full Professor. In 1916 he went to Freiburg, where he taught until he retired in 1928. He died in Freiburg on 27 April 1938.

Husserl's first philosophical work was his Habilitation dissertation, *On the Concept of Number*, which was printed, but not published, in 1887. This was incorporated into the first three chapters of his *Philosophy of Arithmetic*, whose first volume was published in 1891. A second volume was announced, but never came. Instead, Husserl underwent a radical philosophical reorientation. He gave up his main project in *Philosophy of Arithmetic*, which had been to base mathematics on psychology. Instead, he developed his lasting philosophical achievement, phenomenology, which was first presented in *Logische Untersuchungen (Logical Investigations)*, arriving in two volumes in 1900 and 1901. In 1905-7 he introduced the idea of a transcendental reduction and gave phenomenology a turn towards transcendental idealism. This new version of phenomenology was expounded in *Ideen (Ideas)* (1913), and is the most systematic presentation of phenomenology.

Husserl's notable later works were *Vorlesungen zur Phänomenologie des inneren Zeitbewusstseins (On the Phenomenology of the Consciousness of Internal Time)* (1928), *Formale und transzendentale Logik (Formal and Transcendental Logic)* (1929), which Husserl characterized as his most mature work, and *Kartesianische Meditationen (Cartesian Meditations)* (1931). The first part of his *Krisis der europäischen Wissenschaften (Crisis of the European Sciences)* was published in 1936, but the main part of this work and about 40,000 pages of manuscripts were left after his death. These manuscripts, together with Husserl's family and his library, were rescued from Germany by the Belgian Franciscan Van Breda, who established the Husserl Archive in Louvain, where the material is now accessible to researchers. Copies of the manuscripts are kept in other Husserl archives in various parts of the world. Gradually, the most important parts of Husserl's papers and scholarly editions of his published works are being published in the series *Husserliana*. In addition, *Erfahrung und Urteil (Experience and*

Judgment) was prepared by Husserl's assistant Ludwig Landgrebe in consultation with Husserl, and appeared shortly after Husserl's death in 1938. Husserl's main works are available in good English translations.

2 Intentionality

The central theme of phenomenology is intentionality. All of phenomenology can be regarded as an unfolding of the idea of intentionality (see Intentionality). Husserl's interest in intentionality was inspired by his teacher, Franz Brentano. However, there are many differences between Husserl's treatment of this notion and that of Brentano. This section deals first with these differences, then goes on to further features of Husserl's notion of intentionality reaching beyond the issues considered by Brentano.

Husserl retains the following basic idea of Brentano's: 'We understand by intentionality the peculiarity of experiences to be "consciousness of something"' ([1913] 1950: 3, 1, 188; Husserl's emphasis). Husserl's formulation comes close to Brentano's oft-quoted passage from *Psychology from an Empirical Point of View*:

> Every mental phenomenon is characterized by what the scholastics in the Middle Ages called the intentional (and also mental) inexistence of an object, and what we could also call, although in not entirely unambiguous terms, the reference to a content, a direction upon an object.
>
> (1874: 1, 2, 85)

However, there is already an important difference between Brentano and Husserl at this starting-point. While Brentano says straightforwardly that for every act there is an object towards which it is directed, Husserl focuses on the 'of'-ness of the act. There are two reasons for this difference: First, Husserl wants to get around the difficulties connected with acts that lack an object. Second, he aims to throwing light on what it means for an act to be 'of' or 'about' something. Let us begin by discussing these two differences.

Acts that lack an object. Brentano's thesis may seem unproblematic in the examples Brentano considered: just as when we love there is somebody or something that we love, so there is something that we sense when we sense, something we think of when we think, and so on. However, what is the object of our consciousness when we hallucinate, or when we think of a centaur? Brentano insisted that even in such cases our mental activity, our sensing or thinking, is directed towards some object. The directedness has nothing to do with the reality of the object, he held. The object is contained in our mental activity, 'intentionally' contained in it. And Brentano defined mental phenomena as 'phenomena which contain an object intentionally'.

Not all of Brentano's students found this lucid or satisfactory, and the problem continued to disturb both them and Brentano. Brentano struggled with it for the rest of his life, and suggested, among other things, a translation theory, giving Leibniz credit for the idea: when we describe an act of hallucination, or of thinking of a centaur, we are only apparently referring to an object. The apparent reference to an object can be translated away in such a way that in the full, unabbreviated description of the act there is no reference to any problematic object. There are two weaknesses of Brentano's proposal. First, unlike Russell later, Brentano does not specify in detail how the translation is to be carried out (see Russell, B. §9). Second, if such a translation can be carried out in the case of hallucinations and so on, then why not carry it out everywhere, even in cases of normal perception? What then happens to the doctrine of intentionality as directedness upon an object?

One of Brentano's students, Alexius Meinong (§§2-4), suggested a simple way out. In his *Gegenstandstheorie* Meinong maintained that there are two kinds of objects, those that exist and those that do not exist. Hallucinations, like normal perception, are directed towards objects, but these objects do not exist. Brentano was not happy with this proposal. He objected that, like Kant, he could not make sense of existence as a property that some objects have and others lack.

Husserl's solution was, as noted, to emphasize the 'of'. Consciousness is always consciousness *of* something. Or better, consciousness is always *as if of* an object. What matters is not whether or not there is an object, but what the features are of consciousness that makes it always be as if of an object. These three words, 'as if of' are the key to Husserl's notion of intentionality. To account for the directedness of consciousness by saying only that it is directed towards an object leaves us in the dark with regard to what that directedness is. This leads us to the second reason for why Husserl diverged from Brentano. Husserl wanted to throw light on just this issue: what does the directedness of consciousness consists in? He made it a theme for a new discipline: the discipline of

phenomenology.

What is directedness? To get a grip on what the directedness of consciousness consists in - to understand better the word ‘of’, which Husserl emphasized in his definition of intentionality quoted at the beginning of §2 above - let us note that for Husserl intentionality does not simply consist in consciousness directing itself towards objects that are already there. Intentionality for Husserl means that consciousness in a certain way ‘brings it about’ that there are objects. Consciousness ‘constitutes’ objects, Husserl said, borrowing a word from the German Idealists, but using it in a different sense. Above, the phrase ‘bringing about’ was put in quotation marks to indicate that Husserl does not mean that we create or cause the world and its objects. ‘Intentionality’ means merely that the various components of our consciousness are interconnected in such a way that we have an experience as of one object. To quote Husserl:

> an object ‘constitutes’ itself - ‘whether or not it is actual’ - in certain concatenations of consciousness which in themselves bear a discernible unity in so far as they, by virtue of their essence, carry with themselves the consciousness of an identical X.
>
> ([1913] 1950: 3, 1, 313; translation emended)

Husserl’s use, here and in many other places, of the reflexive form ‘an object constitutes itself’, reflects his view that he did not regard the object as being produced by consciousness. Husserl considered phenomenology as the first strictly scientific version of transcendental idealism, but he also held that phenomenology transcends the traditional distinction between idealism and realism, and in 1934 he wrote in a letter to Abbé Baudin: ‘No ordinary "realist" has ever been as realistic and concrete as I, the phenomenological "idealist" (a word which by the way I no longer use)’ (Kern 1964: 276). In the preface to the first English edition of the *Ideas* (1931), Husserl stated:

> Phenomenological idealism does not deny the factual [*wirklich*] existence of the real [*real*] world (and in the first instance nature) as if it deemed it an illusion …. Its only task and accomplishment is to clarify the sense [*Sinn*] of this world, just that sense in which we all regard it as really existing and as really valid. That the world exists…is quite indubitable. Another matter is to understand this indubitability which is the basis for life and science and clarify the basis for its claim.
>
> (1950: 5, 152-3)

To see more clearly what Husserl is after, consider Jastrow and Wittgenstein’s duck/rabbit picture. In order to come closer to Husserl we should modify the example and consider not a picture, but a silhouette of the real animal against the sky. When we see such a silhouette against the sky, we may see a duck or a rabbit. What reaches our eyes is the same in both cases, so the difference must be something coming from us. We structure what we see, and we can do so in different ways. The impulses that reach us from the outside are insufficient to determine uniquely which object we experience; something more gets added.

3 Noema

The structure that makes up the directedness of consciousness, Husserl called the ‘noema’. More accurately, the noema has two main components. First, the ‘object meaning’ that integrates the various constituents of our experience into experiences of the various features of *one* object, and second, the ‘thetic’ component that differentiates acts of different kinds, for example, the act of perceiving an object from the act of remembering it or thinking about it. The thetic component is thereby crucial for the reality-character which we ascribe to the object.

Our consciousness structures what we experience (see Kant, I.). How it structures it depends on our previous experiences, the whole setting of our present experience and a number of other factors. If we had grown up surrounded by ducks, but had never heard of rabbits, we would have been more likely to see a duck when confronted with the duck/rabbit silhouette; the idea of a rabbit would not have occurred to us.

The structuring always takes place in such a way that the many different features of the object are experienced as connected with one another, as features of one and the same object. When, for example, we see a rabbit, we do not merely see a collection of coloured patches, various shades of brown spread out over our field of vision (incidentally, even seeing coloured patches involves intentionality, since a patch is also a kind of object, but a different kind of object from a rabbit). We see a rabbit, with a determinate shape and a determinate colour, with the

ability to eat, jump and so on. It has a side that is turned towards us and one that is turned away from us. We do not see the other side from where we are, but we see something which has another side.

That seeing is intentional, or object-directed, means just this, that it is as if of an object: the near side of the object we have in front of us is regarded as a side of a thing, and the thing we see has other sides and features that are co-intended, in the sense that the thing is regarded as more than just this one side. The object meaning of the noema is the comprehensive system of determinations that gives unity to this manifold of features and makes them aspects of one and the same object.

It is important at this point to note that the various sides, appearances or perspectives of the object are constituted together with the object. There are no sides and perspectives floating around before we start perceiving, which are then synthesized into objects when intentionality sets in. There are no objects of any kind, whether they be physical objects, sides of objects, appearances of objects or perspectives of objects without intentionality. And intentionality does not work in steps. We do not start by constituting six sides and then synthesize these into a die; we constitute the die and the six sides of it in one step.

We should also note that when we experience a person, we do not experience a physical object, a body, and then infer that a person is there. We experience a fully fledged person, we are encountering somebody who structures the world, experiences it from their own perspective. Our noema is a noema of a person; no inference is involved. Seeing persons is no more mysterious than seeing physical objects, and no inference is involved in either case. When we see a physical object we do not see sense-data or the like and then infer that there is a physical object there, but our noema is the noema of a physical object. Similarly, when we see an action, what we see is a fully fledged action, not a bodily movement from which we infer that there is an action.

The word ‘object’ must hence be taken in a very broad sense. It comprises not only physical things, but also, as we have seen, animals, and likewise persons, events, actions and processes, and sides, aspects and appearances of such entities.

Essences. Husserl distinguishes between physical objects and processes, which are temporal and normally also spatial, and essences (*Wesen*) or eidos, which are features that the object can share with other objects, such as the triangularity of a triangle or the greenness of a tree. For Husserl, an object’s essence is therefore not something unique to that object, as it is for many other philosophers. Mathematics is the most highly developed study of essences.

Noema and meaning. The features of the noema that we have mentioned, in particular the role it plays in the analysis of acts without objects and the way it accounts for the object-directedness of acts, make it natural to compare the noema to the meaning of linguistic expressions. This comparison and the ensuing way of reading Husserl has been contested. However, it is well supported by textual and systematic considerations, and it is now often regarded as the standard way of interpreting Husserl. One factor contributing to this has been Husserl’s own statement, in a manuscript, that ‘the noema is nothing but a generalization of the notion of meaning (*Bedeutung*) to the field of all acts’ ([1913] 1950: 5, 89).

Noesis. The noema is an abstract structure that can in principle be the same from act to act, in the unlikely case that at two different occasions we should have the same kind of experience of the same object from the same point of view, with exactly the same anticipations, and so on. An act has a noema in virtue of comprising a kind of experience that Husserl calls a ‘noesis’. The noema is the meaning given in an act, Husserl says, while the noesis is the meaning-giving aspect of the act. There is hence a close parallelism between noema and noesis. The relation between noema and noesis bears some similarity to the type/token relation in Peirce (see Type/token distinction). The noesis is a temporal process, in which the noema ‘dwells’.

4 Hyle; filling; evidence

In acts of perception, the noema that we can have is restricted by what goes on at our sensory surfaces, but the restriction does not narrow our possibilities down to just one. Thus in a given situation I may perceive a man, but later come to see that the man was a mannequin, with a corresponding shift of noema. Such a shift of noema is always possible, corresponding to the fact that perception is always fallible. These boundary conditions, which constrain the noemata we can have, Husserl calls ‘hyle’. The hyle are not objects experienced by us, but are

experiences of a kind which we typically have when our sense organs are affected, but also can have in other cases, for example, under the influence of fever or drugs.

In the case of an act of perception, its noema can also be characterized as a very complex set of expectations or anticipations concerning what kind of experiences we will have when we move around the object and perceive it, using our various senses. We anticipate different further experiences when we see a duck and when we see a rabbit. In the first case we anticipate, for example, that we will feel feathers when we touch the object, while in the latter case we expect to find fur. When we get the experiences we anticipate, the corresponding component of the noema is said to be ‘filled’. In all perception there will be some filling: the components of the noema that correspond to what presently ‘meets the eye’ are filled, and similarly for the other senses.

Such anticipation and filling is what distinguishes perception from other modes of consciousness, such as imagination or remembering. If we merely imagine things, our noema can be of anything whatsoever. In perception, however, our sensory experiences are involved; the noema has to fit in with our sensory experiences. This eliminates a number of noemata which I could have had if I were just imagining. In your present situation you can probably not have a noema corresponding to the perception of an elephant. This does not reduce the number of perceptual noemata you can have just now to one, for example, of having a book in front of you.

It is a central point in Husserl’s phenomenology that I can have a variety of different perceptual noemata that are compatible with the present impingements upon my sensory surfaces. In the duck/rabbit case this was obvious, for we could go back and forth at will between having the noema of a duck and having the noema of a rabbit. In most cases, however, we are not aware of this possibility. Only when something untoward happens, when I encounter a ‘recalcitrant’ experience that does not fit in with the anticipations in my noema, do I start seeing a different object from the one I thought I saw earlier. My noema ‘explodes’, to use Husserl’s phrase, and I come to have a noema quite different from the previous one, with new anticipations. This is always possible, he says. Perception always involves anticipations that go beyond what presently ‘meets the eye’, and there is always a risk that we may go wrong, regardless of how confident and certain we might feel.

When some components of the noema are filled, we have ‘evidence’. Evidence comes in degrees, depending on how much of the noema is filled. Husserl discusses two kinds of perfect evidence: ‘adequate’ evidence, where every component in the noema is filled, with no unfilled anticipations, and ‘apodictic’ evidence, where the negation of what seems to be the case is self-contradictory. After some vacillation Husserl ended up holding that we can never attain any of these kinds of perfect evidence - we are always fallible.

5 Intuition

Husserl uses the term ‘intuition’ (*Anschauung*) for any act where an object is experienced as ‘given’, that is, as really there. Earlier philosophers have used the word ‘intuition’ in a variety of ways, mostly about some sort of direct, non-inferential insight. Perception has usually been classified as a kind of intuition. A key issue in medieval philosophy as well as in rationalism and empiricism was whether there are other sorts of such insight. Kant defined ‘intuition’ as a representation which ‘relates immediately to its object and is singular’ (*Critique of Pure Reason* 1781/87: A320; B376-7). Bernard Bolzano developed this idea with great precision. For Husserl, an intuition is an act where we are constrained in how we constitute its objects, such as we typically are in perception, which is one of his two varieties of intuition. He calls the other variety ‘essential insight’ (*Wesensschau*). The object is here a general feature, an essence. For Husserl, as for Kant, intuition is a key kind of evidence in mathematics. This, then, is what Husserl means by the mysterious-sounding term ‘*Wesensschau*’. One might still claim that there is no such thing, but it is difficult to reject the notion once one agrees that the object of an act is underdetermined by what reaches our senses, and one accepts the correlated idea of intentionality.

6 The reductions; phenomenology

Husserl distinguishes between several so-called ‘reductions’. First, there is the ‘eidetic’ reduction, which we perform each time we pass from focusing on an individual physical object to focusing on one of its essences (eidos). This kind of reduction has been carried out in mathematics since its beginning, and Husserl conceived of other eidetic sciences in addition to mathematics. Second, a reduction that is distinctive for phenomenology is a special kind of reflection. Instead of focusing on the normal objects of our acts, be they physical objects, actions,

persons or general features that many objects can have in common, we reflect on the structures of our own consciousness and study the noemata, the noeses or the hyle. The noemata, the noeses and the hyle have two important features: we are normally not aware of them, and they are a *sine qua non* for the appearance of a world. Entities with these two features are called ‘transcendental’. The reduction that leads to them, where the ordinary objects are bracketed, is therefore called the ‘transcendental’ reduction. Husserl also calls it the ‘epoché’, using a word that the ancient sceptics used for refraining from taking a stand. We study the features of the act that make it seem to have an object and do not ask whether or not it actually has one. Husserl got the idea of the transcendental reduction in 1905. It marks the transition from the early phenomenology of the *Logical Investigations* to the ‘idealist’ phenomenology of the *Ideas* and later works.

The ‘phenomenological’ reduction, finally, is the combination of the eidetic reduction and the transcendental reduction. That is, it is a reduction that leads us from acts directed towards physical objects via acts directed towards essences to acts directed towards the noema, noesis and hyle of acts directed towards essences. Husserl sometimes takes the two steps in the inverse order, starting with a transcendental reduction and then focusing on the essential traits of the noema, noesis and hyle. The end product is not quite the same, but the phenomenological reduction can presumably be either.

Phenomenology is the study of the transcendental elements in our experience that are uncovered through the phenomenological reduction: the noema, the noesis and the hyle. In phenomenology, all these three elements are studied, with emphasis on the noematic/noetic structures. Husserl carried out detailed analyses of temporal structures and how they are constituted, in *On the Phenomenology of the Consciousness of Internal Time*, on the structures that are basic to logic and mathematics, in *Formal and Transcendental Logic* and *Experience and Judgment*, and on intersubjectivity and the processes whereby we come to constitute a common world, in *Cartesian Meditations* and in thousands of pages of manuscripts, the most important of which have been collected by Iso Kern in *Husserliana*, vols 13-15.

For Husserl, phenomenology is a study of the subjective perspective. In science one aims for objectivity and endeavours to arrange observations and experiments in such a way as to minimize differences between different observers. Phenomenology focuses on the subjective, on the manner in which each subject structures or ‘constitutes’ the world differently, on the basis of different experiences and cultural background, but also on the basis of adaptation to other subjects through interaction and communication.

7 The past

We constitute not only the different properties of things, but also the relation of the thing to other objects. If, for example, I see a tree, the tree is conceived of as something which is in front of me, as perhaps situated among other trees, as seen by other people than myself, and so on. It is also conceived of as something which has a history: it was there before I saw it, it will remain after I have left, or perhaps it will eventually be cut down and transported to some other place. However, like all material things, it does not simply disappear from the world.

My consciousness of the tree is in this way also a consciousness of the world in space and time in which the tree is located. My consciousness constitutes the tree, but at the same time it constitutes the world in which the tree and I are living. If my further experience makes me give up the belief that I have a tree ahead of me because, for example, I do not find a tree-like far side or because some of my other expectations prove false, this affects not only my conception of what there is, but also my conception of what has been and what will be. Thus in this case, not just the present, but also the past and the future are reconstituted by me. To illustrate how changes in my present perception lead me to reconstitute not just the present, but also the past, Husserl uses an example of a ball which I initially take to be red all over and spherical. As it turns, I discover that it is green on the other side and has a dent:

> the sense of the perception is not only changed in the momentary new stretch of perception; the noematic modification streams back in the form of a retroactive cancellation in the retentional sphere and modifies the production of sense stemming from earlier phases of the perception. The earlier apperception, which was attuned to the harmonious development of the ‘red and uniformly round’, is implicitly ‘reinterpreted’ to ‘green on one side and dented’.
>
> (1938: 96)

Husserl held that time and space are constituted. In *On the Phenomenology of the Consciousness of Internal Time* and various manuscripts that have been published in Volume 10 of *Husserliana* he gives a highly interesting analysis of the way objective time is constituted (Miller 1984).

8 Values; practical function

So far we have focused on the factual properties of things. However, things also have *value* properties, and these properties are constituted in a corresponding manner. The world within which we live is experienced as a world in which certain things and actions have a positive value, others a negative. Our norms and values, like our beliefs, are subject to change. Changes in our views on matters of fact are often accompanied by changes in our evaluations.

Husserl emphasizes that our perspectives and anticipations are not predominantly factual. We are not living a purely theoretical life. According to Husserl, we encounter the world around us primarily ‘in the attitude of the natural pursuit of life’, as ‘living functioning subjects involved in the circle of other functioning subjects’ (1950: 4, 375). Husserl says this in a manuscript from 1917, but he has similar ideas about the practical both earlier and later. Thus in the *Ideas* he says: ‘ this world is there for me not only as a world of mere things, but also with the same immediacy as a world of values, a world of goods, a practical world’ ([1913] 1950: 3, 1, 58).

In later manuscripts, particularly from 1917 onwards, Husserl focused more and more on the role of the practical and the body in our constitution of the world. Just as he never held that we first perceive sense-data, or perspectives or appearances, which are then synthesized into physical objects, or that we first perceive bodies and bodily movements and then infer that there are persons and actions, so it would be a grave misunderstanding of Husserl to attribute to him the view that we first perceive objects that have merely physical properties and then assign a value or a practical function to them. Things are directly experienced by us as having the features - functional and evaluational as well as factual - that are of concern for us in our natural pursuit of life.

In our discussion of the hyle we characterized the noema of an act of perception as a very complex set of expectations or anticipations concerning what kind of experiences we will have when we move around the object and perceive it. We should note that these experiences depend not only on our sensory organs, but also on the movements of our body, on our bodily skills and our familiarity with various kinds of practical activities. In numerous passages Husserl talks about practical anticipations and the role of kinesthesis in perception and bodily activity (Føllesdal 1979).

9 Horizon

When we are experiencing an object, our consciousness is focused on this object, and the rest of the world and its various objects are there in the background as something we ‘believe in’ but are not presently paying attention to. The same holds for most of the inexhaustibly many features of the object itself. All these further features of the object, together with the world in which it is set, make up what Husserl calls the ‘horizon’ of that experience. The various features of the object, which are co-intended, or also-meant, but not at the focus of our attention, Husserl calls the ‘inner horizon’, while the realm of other objects and the world to which they all belong, he calls the ‘outer horizon’.

The horizon is of crucial importance for Husserl’s concept of justification, which we shall discuss later. What is particularly significant is the hidden nature of the horizon. As we noted, the horizon is that which is not attended to. Take as an example our ‘expectation’ that we will find a floor when we enter a room. Usually, we have not even thought about there being a floor. Typically, we cannot even recall when we first acquired the corresponding ‘belief’ or ‘anticipation’. According to Husserl, there may never have been any occasion when we actually judged there to be a floor in some particular room. Still we have come to ‘anticipate’ a floor, not in the sense of consciously expecting one, but in the sense that if we entered the room and there were none, we would be astonished. In this example we would easily be able to tell what was missing, in other cases our ‘anticipations’ are so imperceptible that we just may feel that something has gone awry, but not be able to tell what it is.

Words like ‘belief’ and ‘anticipate’ are clearly not the proper ones here, since they have overtones of something being conscious and thought about. Both English and German seem to lack words for what we want to get at here: Husserl uses the words ‘*antizipieren*’, ‘*hinausmeinen*’ and ‘*vorzeichnen*’.

10 Intersubjectivity

Throughout his life, Husserl emphasized that the world we intend and thereby constitute is not our own private world, but an intersubjective world, common to and accessible to all of us. Thus in the *Ideas* he writes:

> I continually find at hand as something confronting me a spatiotemporal reality [*Wirklichkeit*] to which I belong like all other human beings who are to be found in it and who are related to it as I am.
>
> ([1913] 1950: 3, 1, 61)

Husserl's studies of intersubjectivity focus in particular on the processes by which we experience others as experiencing subjects, like ourselves, and adapt our anticipations to those that we take them to have. Thanks to this, our way of constituting the world is not solipsistic, but we constitute the world as a shared world, which we each experience from our different perspective. A notion of objectivity arises, we may come to regard ourselves as deviant, for example, as colour-blind or as cognitively biased, and we also experience ourselves as confronted with a reality to which our beliefs and anticipations have to adapt. In works that remain largely unpublished, Husserl started to develop an ethics based in part on a study of the objectifying processes whereby objective ethical principles and norms arise from our subjective likes and dislikes.

Husserl stresses the shared, intersubjective nature of the world, particularly in §29 of the *Ideas*, which he entitles 'The "Other" Ego-subjects and the Intersubjective Natural Surrounding World'. There he says:

> I take their surrounding world and mine Objectively as one and the same world of which we are conscious, only in different ways [*Weise*].… For all that, we come to an understanding with our fellow human beings and together with them posit an Objective spatiotemporal reality.
>
> ([1913] 1950: 3, 1, 60)

In the later works one finds similar ideas, particularly in the many texts that have been collected by Iso Kern in the three volumes of the *Husserliana* devoted to intersubjectivity, but also in many other works, for example in the *Crisis*:

> Thus in general the world exists not only for isolated men but for the community of men; and this is due to the fact that even what is straightforwardly perceptual is communal.
>
> (1936, 1954: 6, 166)

Husserl discusses in great detail empathy and the many other varieties of intersubjective adaptation that enable us to intend a common, intersubjective world. (See the three volumes on intersubjectivity referred to above.)

11 Existence

The passages quoted in §10 above express a further feature of Husserl's notion of intentionality which is rarely discussed, in spite of its importance: intentionality does not just involve directedness upon an object, but also a 'positing' of the object, corresponding to the two components of the noema discussed in §3 above. The object is experienced as real and present, as remembered, or as merely imagined, and so on. In the passages just quoted, Husserl said, 'I continually find at hand as something confronting me a spatiotemporal reality', and 'we come to an understanding with our fellow human beings and together with them posit an Objective spatiotemporal reality'. The same point is stressed also when he discusses the lifeworld in the Crisis:

> the lifeworld, for us who wakingly live in it, is always there, existing in advance for us, the 'ground' of all praxis, whether theoretical or extratheoretical. The world is pregiven to us, the waking, always somehow practically interested subjects, not occasionally but always and necessarily as the universal field of all actual and possible praxis, as horizon. To live is always to live-in-certainty-of-the-world.
>
> (1936, 1954: 6, 145)

Husserl discusses this *thetic* character of intentionality, and, correspondingly, of the noema, in many of his books and manuscripts. He was particularly concerned with what gives reality-character to the world. Like William James, whom he had read already when he made the transition to phenomenology in the mid-1890s, he stressed the importance of the body, and the inflictions upon our body, for our sense of reality. As James put it: 'Sensible

vividness or pungency is then the vital factor in reality' (1890: 2, 301). Husserl could also have subscribed to James's observation that 'the *fons et origo* of all reality, whether from the absolute or the practical point of view, is thus subjective, is ourselves' (1890: 2, 296-7).

This latter passage from James gets a double meaning in Husserl which expresses the core of his view of the reality of the world: the subjective (ourselves) is the *fons et origo* of all reality in two senses, a transcendental and an empirical: we constitute the world as real through our intentionality, and the reality-character we give it is derived from our being not merely transcendental subjects, but empirical subjects with a body immersed in a physical world.

12 The lifeworld

The idea of Husserl's that has become most widely known is that of the lifeworld. In particular, the word 'lifeworld' (*Lebenswelt*) itself has gained wide currency. It was used by Simmel and others before Husserl. After the Second World War it became a favourite word of many social scientists, who used it in many different senses. Several of them refer to Husserl without seeming to have studied his philosophy and therefore without knowing the many important features that the lifeworld has in his thought.

The first place Husserl uses the word 'lifeworld' in print is in his latest work, the *Crisis*, of which the first two parts were published in 1936. The rest of this unfinished work, containing the important third part, with the main discussion of the lifeworld, was not published until 1954, but it was known to some of Husserl's students and followers, including Maurice Merleau-Ponty, who came to the Husserl Archives in Louvain to study this part in April 1939.

Interpreters of Husserl differ widely in their views on the lifeworld. It is often thought that it constitutes a major break in Husserl's development, from the 'early' Husserl of the *Ideas* to the 'late' Husserl of the *Crisis*. Is it such a break? And second, what exactly is the lifeworld and what role does it play in phenomenology? On the former question the answer is a definite 'No'. The lifeworld is fully compatible with Husserl's earlier philosophy, and there is even a definite place for it in his phenomenology from its beginning. Husserl touches upon the lifeworld repeatedly in his earlier work and he gradually deepens and modifies his views on it, as he did with everything else in his phenomenology. Instead of regarding the lifeworld as a break with Husserl's earlier philosophy, we should view it as intimately connected with the other main themes in phenomenology. Properly to understand the lifeworld with all its nuances it is important to appreciate fully the connection between it and the rest of Husserl's philosophy.

The lifeworld arises from the distinction between the natural attitude and the transcendental or phenomenological attitude, which Husserl introduced in 1905. The first appearance of the notion for which he later introduced the term 'lifeworld' occurs shortly thereafter, in his lectures 'Fundamental Problems in Phenomenology' in 1910-11, that is, already before the *Ideas*. Husserl begins these lectures with an extended discussion of 'the natural attitude and the "natural world concept"'. Here he says:

> It could also be shown that philosophical interests of the highest dignity require a complete and comprehensive description of the so-called *natural world concept*, that of the natural attitude, on the other hand also that an accurate and profound description of this kind is not easily carried out, but on the contrary would require exceptionally difficult reflections.
>
> (1950: 13, 124-5)

Husserl here borrows the phrase 'natural world concept', which he emphasizes, from Richard Avenarius, whom he discusses later in the lecture. In a manuscript from 1915, Husserl describes this world in the following way (following Avenarius):

> All opinions, justified or unjustified, popular, superstitious, scientific, all relate to the already *pregiven world*.… All theory relates to this immediate givenness and can have a legitimate sense only when it forms thoughts which do not offend against the general sense of the immediately given. No theorizing may offend against this sense.
>
> (1950: 13, 196; emphasis added)

In the following years, Husserl repeatedly returns to this and related themes, using various labels that sometimes allude to other philosophers who had propounded similar ideas, such as Nietzsche. Quite often he uses Avenarius' phrase 'natural world'. In a manuscript from 1917, which appears to be the first place where he uses the word 'lifeworld', he introduces this new word as equivalent to the former: 'The lifeworld is the natural world - in the attitude of the natural pursuit of life are we living functioning subjects involved in the circle of other functioning subjects' (1950: 4, 375; the manuscript dates from 1917, but was copied during the first half of the 1920s, and it is possible that the word 'lifeworld' appeared then).

Gradually during the 1920s and especially in the 1930s the lifeworld becomes a central theme in Husserl's writings, until his discussion culminates in the *Crisis* in 1936. One aim of this work was to provide a new and better access to phenomenology, through the notion of the lifeworld. The lifeworld is for Husserl our natural world, the world we live in and are absorbed by in our everyday activities. A main aim of phenomenology is to make us reflect on this world and make us see how it is constituted by us. Through the phenomenological reduction phenomenology will take us out of our natural attitude where we are absorbed by the world around us, into the phenomenological, transcendental attitude, where we focus on the noemata of our acts - on our structuring of reality.

Pregivenness. In the passage just quoted from Husserl's 1915 manuscript, Husserl says that the world is pregiven (*vorgegeben*). This point is also discussed in the *Ideas*, where Husserl notes that

> In my waking consciousness I find myself in this manner at all times, and without ever being able to alter the fact, in relation to the world which remains one and the same, though changing with respect to the composition of its contents. It is continually 'on hand' for me and I myself am a member of it.
>
> ([1913] 1950: 3, 1, 58)

and a few pages later the passage that was quoted earlier, in the section on intersubjectivity:

> I continually find at hand as something confronting me a spatiotemporal reality [*Wirklichkeit*] to which I belong like all other human beings who are to be found in it and who are related to it as I am.
>
> ([1913] 1950: 3, 1, 61)

Also the passage from §37 of the *Crisis* that was quoted in the section on existence above expresses this same idea:

> The lifeworld…is always there, existing in advance for us, the 'ground' of all praxis, whether theoretical or extratheoretical. The world is pregiven to us…
>
> (1936, 1954: 6, 145)

Science and the lifeworld. A contested point in Husserl scholarship is the relation between the lifeworld and the sciences. Many interpreters of Husserl like to find an opposition to the sciences in the lifeworld. However, such a disdain for the sciences is out of character with Husserl's background in and continued interest in mathematics and science. It also accords poorly with the texts, which give us a different and more intriguing picture. According to Husserl, the lifeworld and the sciences are intimately connected, in three different ways:

(1) The sciences are *part* of the lifeworld. This comes out most explicitly and clearly in *Experience and Judgment*, where Husserl says:

> everything which contemporary natural science has furnished as determinations of what exists also belong to us, to the world, as this world is pregiven to the adults of our time. And even if we are not personally interested in natural science, and even if we know nothing of its results, still, what exists is pregiven to us in advance as determined in such a way that we at least grasp it as being in principle scientifically determinable.
>
> (1938: 39)

Similar statements are also found elsewhere in Husserl's work, for example in the *Crisis*: 'Now the scientific world - [the subject matter of] systematic theory - …like all the worlds of ends "belongs" to the lifeworld' (1936, 1954: 6, 460).

(2) Scientific statements get their *meaning* by being embedded in the lifeworld. This was stressed by Husserl already in the manuscript from 1915, quoted in §12 above:

> All opinions, justified or unjustified, popular, superstitious, scientific, all relate to the already *pregiven world*.… All theory relates to this immediate givenness and can have a legitimate *sense* only when it forms thoughts which do not offend against the general sense of the immediately given. No theorizing may offend against this sense.
>
> (1950: 13, 196; emphasis added)

(3) The sciences are *justified* through the lifeworld. There is an interplay between this point and point (1) above; the sciences are justified because they belong to the lifeworld, and at the same time they belong to the lifeworld because they are conceived of as describing the world, as claiming to be true:

> Though the peculiar accomplishment of our modern objective science may still not be understood, nothing changes the fact that it is a validity for the lifeworld, arising out of particular activities, and that it belongs itself to the concreteness of the lifeworld.
>
> (1936, 1954: 6, 136)

And similarly:

> all these theoretical results have the character of validities for the lifeworld, adding themselves as such to its own composition and belonging to it even before that as a horizon of possible accomplishments for developing science. The concrete lifeworld, then, is the grounding soil [*der gründende Boden*] of the 'scientifically true' world and at the same time encompasses it in its own universal concreteness.
>
> (1936, 1954: 6, 134)

13 Ultimate justification

This brings us to the final theme of this presentation of Husserl's phenomenology: the role of the lifeworld in justification (see Justification). The traditional interpretation of Husserl attributes to him a 'foundationalist' position: he is alleged to hold that we can reach absolute certainty with regard to a number of matters, particularly in philosophy. However, there is considerable evidence that Husserl had a view on justification similar to that of Goodman and Rawls (Føllesdal 1988). An opinion is justified by being brought into 'reflective equilibrium' with the *doxa* of our lifeworld. This holds even for mathematics: 'mathematical evidence has its source of meaning and of legitimacy in the evidence of the lifeworld' (1936, 1954: 6, 143).

A major puzzle that many see in this idea of justification is, 'How can appeal to the subjective-relative doxa provide any kind of justification for anything? It may help to resolve disagreements, but how can it serve as justification?' Husserl answers by pointing out that there is no other way of justifying anything, and that his way is satisfactory:

> What is actually first is the 'merely subjective-relative' intuition of prescientific world-life. For us, to be sure, this 'merely' has, as an old inheritance, the disdainful colouring of the *doxa*. In prescientific life itself, of course, it has nothing of this; there it is a realm of good verification and, based upon this, of well-verified predicative cognitions and of truths which are just as secure as is necessary for the practical projects of life that determine their sense. The disdain with which everything 'merely subjective and relative' is treated by those scientists who pursue the modern ideal of objectivity changes nothing of its own manner of being, just as it does not change the fact that the scientist himself must be satisfied with this realm whenever he has recourse, as he unavoidably must have recourse, to it.
>
> (1936, 1954: 6, 127-8)

So far, this is a mere claim. However, Husserl elaborates his view in other parts of his work. His key observation, which is an intriguing contribution to our contemporary discussion of ultimate justification, is that the 'beliefs', 'expectations' or 'acceptances' on which we ultimately fall back are unconsidered, and in most cases have never been considered. Every claim to validity and truth rests upon this 'iceberg' of unconsidered prejudgmental acceptances discussed earlier. One would think that this would make things even worse. Not only do we fall back on something that is uncertain, but on something that we have not even thought about, and have therefore never subjected to conscious testing. Husserl argues, however, that it is just the unconsidered nature of the lifeworld that makes it the ultimate ground of justification. 'Acceptance' and 'belief' are not attitudes that we decide to have

through any act of judicative decision. What we accept, and the phenomenon of acceptance itself, are integral to our lifeworld, and there is no way of starting from scratch, or 'to evade the issue here through a preoccupation with aporia and argumentation nourished by Kant or Hegel, Aristotle or Thomas' (1936, 1954: 6, 134). Only the lifeworld can be an ultimate court of appeal: 'Thus alone can that ultimate understanding of the world be attained, behind which, since it is ultimate, there is nothing more that can be sensefully inquired for, nothing more to understand' ([1929] 1974: 17, 249) (see Phenomenology, epistemic issues in).

14 Influence

Husserl's phenomenology has been a major influence on philosophy in our century, primarily on the continent, but since the 1970s also in the United States, Britain and several other countries. Husserl's immediate successor in Freiburg, Martin Heidegger, conceived of *Being and Time* (1927) as a phenomenological study and dedicated it to Husserl. Also Jean-Paul Sartre received strong impulses from Husserl, particularly from Husserl's idea that our material surroundings do not uniquely determine our noema. Sartre developed this idea into a philosophy of freedom, notably in *Being and Nothingness* (1943), which has the subtitle 'A Phenomenological Essay on Ontology'. Also Emmanuel Levinas, Paul Ricoeur and several other French philosophers were heavily influenced by Husserl. A new generation of young French and German philosophers is now combining Husserl scholarship with work on systematic issues in epistemology, philosophy of language and philosophy of mind.

Husserl's conception of the lifeworld become important for the so-called 'new hermeneutics' (Heidegger and Gadamer; see Hermeneutics) and for the methodology of the humanities and the social sciences (Schütz, Luckmann), largely because it provides a framework for discussing the subjective perspective and the many features of our way of structuring the world of which we are unaware and that often reflect the culture in which we have grown up. The issues connected with intersubjectivity and Husserl's exploration of the various ways in which we adapt to one another and come to conceive the world as a common world were pursued by several of his students, notably Edith Stein, in her dissertation *On the Problem of Empathy* (1917). His ideas about the role of the body, of kinesthesis and of practical activity recur in different versions in Heidegger's existentialism and in Merleau-Ponty's phenomenology. Merleau-Ponty in particular is generous in the credit he gives Husserl.

Husserl's many students and followers explored a number of other themes in Husserl and applied his ideas in a variety of fields. Thus Roman Ingarden used them in aesthetics, Aron Gurwitsch and several others in the study of perception. Husserl's views have led to new developments in psychology and psychotherapy. They have influenced philosophers of mathematics, including Gödel (see Føllesdal 1995), and they are beginning to have an impact on the philosophy of mind and on cognitive science.

DAGFINN FØLLESDAL

List of works

Husserl, E. (1950-) *Husserliana*, ed. H.L. Van Breda, The Hague: Nijhoff; since 1989, Dordrecht: Kluwer.(The standard critical edition of Husserl's work. References to Husserl's works are by volume, page number and line number in this edition.)

Husserl, E. (1891) *Philosophie der Arithmetik. Logische und psychologische Untersuchungen*, vol. 1, in *Husserliana*, vol. 12, 1970.(Husserl's first book, where he attempted to found arithmetic on psychology. He gave up this project, and the planned second volume of the work never appeared.)

Husserl, E. (1900-1) *Logische Untersuchungen*, in *Husserliana*, vols 18-19, 1950; trans. J.N. Findlay, *Logical Investigations*, London: Routledge & Kegan Paul, 2 vols, 1970.(Husserl's first phenomenological work. Volume 1 is a criticism of psychologism, volume 2 consists of six studies of key themes in phenomenology.)

Husserl, E. (1913) *Ideen*, 3 vols, in *Husserliana*, vols 3-5, 1950; revised edn in two parts, 1976; *Ideas*, vol. 1, trans. F. Kersten, The Hague: Nijhoff, 1982; vol. 2, trans. R. Rojcewicz and A. Schuwer, Dordrecht: Kluwer, 1989; vol. 3, trans. T.E. Klein and W.E. Pohl, Dordrecht: Kluwer, 1980.(Husserl's main systematic presentation of phenomenology. Difficult, but *the* book to read if one should read only one book by Husserl.)

Husserl, E. (1928) *Vorlesungen zur Phänomenologie des inneren Zeitbewußtseins*, in *Husserliana*, vol. 10, 1966; trans. J.B. Brough, *On the Phenomenology of the Consciousness of Internal Time (1893-1917)*, The Hague: Nijhoff, 1991.(Husserl's main texts on time and time-consciousness.)

Husserl, E. (1929) *Formale und transzendentale Logik*, in *Husserliana* vol. 17, 1974; trans. D. Cairns, *Formal*

and Transcendental Logic, The Hague: Nijhoff, 1969. (This book, which Husserl characterized as one of his most mature works, aims at providing a phenomenological foundation for formal logic.)

Husserl, E. (1931) *Kartesianische Meditationen*, in *Husserliana* vol. 1, 1950; 2nd edn, 1973; improved edn, ed. E. Ströker, *Philosophische Bibliothek*, vol. 291, Hamburg: Felix Meiner, 1977; trans. D. Cairns, *Cartesian Meditations*, The Hague: Nijhoff, 1960.(A 'Cartesian' approach to phenomenology. Focuses especially on the ego and on intersubjectivity. Easiest to read among Husserl's later works.)

Husserl, E. (1936, 1954) *Krisis der europäischen Wissenschaften und die transzendentale Phänomenologie*, in *Husserliana* vol. 6, 1954; trans. D. Carr, *The Crisis of European Sciences and Transcendental Phenomenology*, Evanston, IL: Northwestern University Press, 1970.(Presents Husserl's theory of the lifeworld.)

Husserl, E. (1938) *Erfahrung und Urteil. Untersuchungen zur Genealogie der Logik*, ed. L. Landgrebe, Prague: Akademia Verlagsbuchhandlung; trans. J.S. Churchill and K. Amerik, *Experience and Judgment*, Evanston, IL: Northwestern University Press, 1973.(Compiled by Husserl's assistant Ludwig Landgrebe, this work throws light on the lifeworld and several of the themes dealt with in *Formal and Transcendental Logic*.)

Schuhmann, K. and Schuhmann, E. (eds) (1994) *Edmund Husserl Briefwechsel*, The Hague: Nijhoff, 10 vols.(A critical edition of Husserl's correspondence.)

Hutcheson, Francis (1694-1746)

Francis Hutcheson is best known for his contributions to moral theory, but he also contributed to the development of aesthetics. Although his philosophy owes much to John Locke's empiricist approach to ideas and knowledge, Hutcheson was sharply critical of Locke's account of two important normative ideas, those of beauty and virtue. He rejected Locke's claim that these ideas are mere constructs of the mind that neither copy nor make reference to anything objective. He also complained that Locke's account of human pleasure and pain was too narrowly focused. There are pleasures and pains other than those that arise in conjunction with ordinary sensations; there are, in fact, more than five senses. Two additional senses, the sense of beauty and the moral sense, give rise to distinctive pleasures and pains that enable us to make aesthetic and moral distinctions and evaluations.

Hutcheson's theory of the moral sense emphasizes two fundamental features of human nature. First, in contrast to Thomas Hobbes and other egoists, Hutcheson argues that human nature includes a disposition to benevolence. This characteristic enables us to be, sometimes, genuinely virtuous. It enables us to act from benevolent motives, whereas Hutcheson identifies virtue with just such motivations. Second, we are said to have a perceptual faculty, a moral sense, that enables us to perceive moral differences. When confronted with cases of benevolently motivated behaviour (virtue), we naturally respond with a feeling of approbation, a special kind of pleasure. Confronted with maliciously motivated behaviour (vice), we naturally respond with a feeling of disapprobation, a special kind of pain. In short, certain distinctive feelings of normal observers serve to distinguish between virtue and vice. Hutcheson was careful, however, not to identify virtue and vice with these feelings. The feelings are perceptions (elements in the mind of observers) that function as signs of virtue and vice (qualities of agents). Virtue is benevolence, and vice malice (or, sometimes, indifference); our moral feelings serve as signs of these characteristics.

Hutcheson's rationalist critics charged him with making morality relative to the features human nature happens at present to have. Suppose, they said, that our nature were different. Suppose we felt approbation where we now feel disapprobation. In that event, what we now call 'vice' would be called 'virtue', and what we call 'virtue' would be called 'vice'. The moral sense theory must be wrong because virtue and vice are immutable. In response, Hutcheson insisted that, as our Creator is unchanging and intrinsically good, the dispositions and faculties we have can be taken to be permanent and even necessary. Consequently, although it in one sense depends upon human nature, morality is immutable because it is permanently determined by the nature of the Deity.

Hutcheson's views were widely discussed throughout the middle decades of the eighteenth century. He knew and advised David Hume, and, while Professor of Moral Philosophy at Glasgow, taught Adam Smith. Immanuel Kant and Jeremy Bentham, among other philosophers, also responded to his work, while in colonial America his political theory was widely seen as providing grounds for rebellion against Britain.

1 Life and works

Francis Hutcheson was born on 8 August 1694 near Saintfield, County Down, Ireland. Although often taken to be the founder of the Scottish Enlightenment, he always considered himself an Irishman. Hutcheson studied first at a classical school in Saintfield, then at an academy in Killyleagh, and finally, for two years, at Glasgow College. Ordained as a minister in the Presbyterian Church of Ireland, Hutcheson followed instead an academic career. In the early 1720s he established a dissenting academy in Dublin, where he remained until called to Glasgow as Professor of Moral Philosophy in 1729. This position he held until his death, having in 1745 declined an offer of a similar position at Edinburgh.

In Dublin, Hutcheson came under the influence of Robert Molesworth, himself a philosophical disciple of the Third Earl of Shaftesbury. In the mid 1720s Hutcheson published papers outlining some of his own views, and others criticizing Thomas Hobbes and Bernard Mandeville, as well as his first book, *An Inquiry into the Original of our Ideas of Beauty and Virtue* (1725a). This work he initially described as a defence of Shaftesbury against an attack by Mandeville. His *Essay on the Nature and Conduct of the Passions and Affections: with Illustrations on the Moral Sense* appeared in 1728. His next work was probably *A System of Moral Philosophy*, written by 1738 but published only posthumously in 1755. His last major work was his *Philosophiae moralis institutio compendiaria* (1742a), a translation (Hutcheson himself was probably the translator) of which, *A Short*

Introduction to Moral Philosophy, appeared in 1747, the year of his death.

Hutcheson corresponded with, and probably met, David Hume, and gave Hume advice, some of which he took, regarding the third volume of his *Treatise of Human Nature*. Notwithstanding these connections, Hutcheson apparently opposed Hume's efforts to be appointed (in 1745) to the chair of moral philosophy in Edinburgh. Hutcheson's students at Glasgow included Adam Smith, author of *The Theory of Moral Sentiments* (1759) and *The Wealth of Nations* (1776).

2 The foundations of morality and the moral sense

Much of Hutcheson's early work may be seen as a contribution to a long-standing debate about the foundations of morality. For over a century before Hutcheson joined the debate, moral theorists had offered fundamentally incompatible accounts of the origin and nature of morality. Every participant in this debate accepted the fact that there are moral phenomena to explain. No participant denied, for example, that there is a set of moral terms (such terms as, in English, 'good', 'evil', 'virtue', 'vice', 'right', 'wrong', 'just', 'unjust') that are competently used by ordinary speakers. Even those philosophers who were said to have denied that morality has a foundation assumed that it is to rational beings (principally humans) and their actions that this set of terms applies, and supposed that ordinary humans do so apply the terms, however much they may disagree about which term to use in any given situation. The controversy raged, however, over the proper characterization of such moral phenomena. For many writers, it was not merely a matter of providing a causal explanation of these phenomena. Even cynics and sceptics could do that. Rather, these writers, who tended to think of themselves as moral realists, demanded that a proper understanding of morality be a part of this explanation. Having concluded that moral differences are both real and unique, they insisted that one could be said to have given an account of the foundations of morality only if one could trace these real and unique moral differences to some set of objective and unique natural or transcendental features adequate to ground such differences in a non-reductive way.

Hutcheson's work illustrates this latter demand. In a preview of his influential *Inquiry*, he says that his new work will include an essay on the foundations of morality, a needed antidote to the socially poisonous views of those (most notably Hobbes, Samuel Pufendorf and John Locke, as we later learn) who suppose that the 'foundation of virtue' is nothing more than fear of punishment. In the *Inquiry* itself Hutcheson develops his criticism of these 'selfish moralists' (egoists, as we would say), and also makes explicit his deeply felt objections to Mandeville's claim that what is called virtue is simply 'the Political Offspring which Flattery begot upon Pride' (1725a).

Although his philosophy owes much to Locke's empiricist approach to ideas and knowledge, Hutcheson was far from satisfied with Locke's account of our moral ideas and our moral psychology. According to Locke, our normative ideas - of beauty and virtue, for example - are complex ideas of mixed modes, and, although formed out of the materials of experience, have no objective reference. These ideas, Locke says, are constructed by our minds, and are neither copies of anything real, nor even made according to the pattern of any real existence. Hutcheson found this anti-realist account of the origin of our moral ideas seriously flawed. Moreover, he also complained that Locke's account of human pleasure and pain was too narrowly focused. Locke had failed to note that there are pleasures and pains other than those that arise in conjunction with ordinary sensations. Indeed, Locke had failed to note that there are more than five senses, and that our additional senses - the sense of beauty and the moral sense - give rise to distinctive pleasures and pains (to approbations and disapprobations) that enable us to make moral distinctions and moral evaluations. Human nature is considerably more complex than Locke had supposed.

As to Hutcheson's disagreement with Hobbes and Mandeville, Hutcheson can be seen to have rejected their pessimistic, cynical view of human nature - in effect, that humans are inherently corrupt - and to have adopted in its place the more optimistic view that human nature incorporates a substantial element of goodness. More particularly, while Hobbes and Mandeville argue that all human acts are motivated by self-interest, Hutcheson argues that humans have, and actually do act from, other-regarding motives, and that the 'selfish theory' - the view that all motivations are self-interested - cannot account for many features of our moral experience. Hutcheson sees the selfish theorists as maintaining that we act only from a regard for our own pleasure, and hence that those things that we call 'good' are simply those things that give us pleasure, and that the actions we call 'morally good' or 'just' are simply those actions that correspond to whatever laws politicians happen to have promulgated. As a matter of pure speculation these claims may be comprehensible, but a more careful survey of our moral evaluations shows them to be false.

Hutcheson notes in the *Inquiry*, for example (1) that although both a generous action and a productive field give us pleasure, there is a significant difference in the pleasures derived from these two things. Our approbation of them differs in such a way that we would think it quite odd or senseless to say that the field is virtuous, but entirely sensible to say that the action is virtuous (1725a: 114-5, 119, 140-41); (2) that while reading history we learn of temporally distant individuals who cannot contribute to our interests or pleasure, and that, as the actions of these individuals vary, so do our responses: we feel approbation toward some, and disapprobation or indifference toward others; (3) that while we benefit from the actions of an individual who treasonously betrays his country to ours, we none the less morally disapprove of that individual and his actions; (4) that while we ourselves may be bribed to perform an action which we think to be morally wrong, we cannot be bribed to *feel* that this same action is right or that we are right to undertake it; (5) that we sometimes feel a moral indignation toward a person who has caused us no injury at all, while on other occasions we find that, although someone has acted in such a way as to injure us, we feel no moral indignation.

Facts of this sort, Hutcheson concludes, establish beyond doubt that the selfish theory is mistaken. They show that there are natural (immediate and unlearned) differences in our responses to actions or events, differences that cannot be accounted for by this theory. Our moral approvals and disapprovals are more subtle than these philosophers have thought. We find that we naturally and routinely make reliable distinctions (1) between *natural good* and *moral good*; (2) between *moral good* and *moral evil*; and (3) between things that are *immediately good* and those only 'advantageous' or *instrumentally good*. Given these important facts, the question becomes, as Hutcheson typically frames it: 'What feature of human nature is presupposed by the fact that we can and do make these distinctions?' His answer: 'The moral sense'. Had we, he writes in the *Inquiry*, no moral sense enabling us to perceive the moral qualities of agents and actions, we could not respond to them as we do. Without a moral sense we might have developed an abstract idea of virtue, but we would not, as we do, actively approve and esteem those who reveal themselves to be virtuous. Had we 'no Sense of moral Good in Humanity…Self-Love, and our Sense of natural Good' would cause us, contrary to fact, always to approve, for example, of the traitor who benefits our cause, and always to disapprove the courageous patriot who harms our cause. But that is not the case; the facts do not fit the egoists' theory. Rather, such facts reveal that 'there is in human Nature a disinterested ultimate Desire of the Happiness of others', an inherent benevolent, and hence moral, concern.

Humans have also an inherent cognitive power that enables them to respond differently to benevolence and self-interest. The human mind is formed in such a way that it can approve or condemn actions or agents without concern for its own pleasure or interest. Just as the Creator has 'determin'd us to receive, by our external Senses, pleasant or disagreeable Ideas of Objects, according as they are useful or hurtful to our Bodys …[so] he has given us a moral Sense, to direct our Actions, and to give us still nobler Pleasures'. Thus if two individuals contribute in similar ways to our wellbeing, but the one acts 'from an ultimate Desire of our Happiness, or Good-will toward us; and the other from Views of Self-Interest, or by Constraint', we have, we find, significantly different responses to these two individuals and their acts. In response to the one we feel gratitude and approbation; to the other we are indifferent. Or, if we know that an individual has benevolent dispositions but has been prevented from exercising them, we count that individual as morally good even though they have not been able to act - even though they have done nothing to benefit us. The nature and complexity of these responses show that we must have a perceptual power, a moral sense, for without such a sense we would assess fields and agents or patriots and traitors only with regard to our own interests and wellbeing.

In the third edition (1729) of the *Inquiry* Hutcheson explicitly denied that he meant to identify virtue and vice with feelings or sentiment. The moral sense relies upon feelings to distinguish virtue or vice, but moral qualities are themselves independent of the observer who feels approbation or disapprobation of them. The 'admired Quality', he says, is a quality of the agent judged, and entirely distinct from the approbation or pleasure of either the approving observer or the agent, and the moral perceptions (the idea or concept) involved 'plainly represents something quite distinct from this Pleasure'. Feelings play a cognitive and a motivating role, but virtue is constituted by the benevolent disposition that gives rise to approbation, and vice by the malevolent or sometimes indifferent dispositions that give rise to disapprobation.

Gilbert Burnet and John Balguy, two early rationalist critics, pronounced themselves satisfied with Hutcheson's good intentions and even with his fundamental conclusion, namely that virtue and vice are, contrary to Hobbes, Locke, and Mandeville, fundamentally real. Burnet, in his Letter to the *London Journal* (1969-71, vol. 7: 6) could

not agree, however, that Hutcheson had found 'the true and solid foundation' of morality, while Balguy (1728-9), all praise for Hutcheson's good nature and good sense, regrets that he makes serious mistakes - mistakes that 'lie at the Foundations of Morality, and like Failures in Ground-work, affect the whole Building'.

Burnet's fundamental complaint is that Hutcheson's account of moral good and evil explains these notions only relatively - only as good or evil things relate to us or affect us - and gives us no guarantee that good and evil have an immutable foundation in the nature of things. Balguy objected that Hutcheson had rested virtue or morality on two features of human nature, a natural affection (a concern for others) and an instinct (the moral sense). These are, he granted, features of humankind, and it is right of Hutcheson to try to represent virtue as something that flows 'unalterably from the Nature of Men and Things'. But, he went on, Hutcheson portrays morality as something arbitrary, dependent upon human features 'that might originally have been otherwise, or even contrary to what they now are; and [that] may at any time be alter'd, or inverted, if the Creator pleases' (1728: 292). Moreover, in Hutcheson's hands morality is resolved into 'mere *Instinct*'. If we are motivated to what we call virtuous acts by an instinct, of what moral merit are the resulting actions? These actions seem to be necessitated, while virtuous acts are always free acts. If Hutcheson should reply that these instincts do not '*force* the Mind, but only *incline* it', then, says Balguy, it will be reason, and not the moral sense, that decides our actions and thus serves as the foundation of morality.

Hutcheson undertook to meet these objections in a series of letters to the *London Journal* (1725b) and in the second part of his *Essay* of 1728. As an ordained clergyman of the Westminster Confession, Hutcheson was unwilling to deny the creative freedom of the Deity. Consequently, he could not in one sense deny that his theory of the moral sense made morality dependent upon the free choice of the Deity. But he could and did argue that, were the Deity's basic nature not in its own way similar to our kindest affections and best moral nature, then he would not have been motivated to create us in the particular manner in which he did actually create us. On the other hand, if we suppose that the Deity does have an analogously kind and moral nature, then we see at once that this would have motivated him to create us as he did. As long as we are satisfied that the Deity is unchanging, and that his is the best nature possible, we can see that our own natures are nothing like the merely arbitrary result of some divine whim. Our natures are, in any relevant sense, necessary and necessarily fixed or unchanging.

To the charge that he had made morality dependent on an instinct that effectively eliminates the free choice required of moral behaviour, Hutcheson replied by distinguishing between instincts of body and certain mental powers or 'affections'. The latter, he insists, are no more destructive of morality than is the '*Determination to pursue Fitness*' that, according to his opponents, characterizes the divine will. Virtue, Hutcheson argues, can be real and meritorious even though perceived by a sense, and chosen because of an affection or instinct. It is not necessary that reason play these roles. Hutcheson's critics were not satisfied by these replies (Richard Price (1758) was to pose similar objections some thirty years later; see Price, R.), but Hutcheson's responses show how far he was from being the moral noncognitivist some commentators have supposed. He undertook to determine the origin of our moral ideas in order 'to prove what we call the *Reality of Virtue*' (1725a: xi). That his inquiry led him to argue that our moral concerns and evaluations depend on certain fundamental dispositions and feelings - that morality has its origin in certain senses and affections found in human nature - should not prevent us from recognizing this realist intent.

3 Practical ethics and influence

Although Hutcheson's later works, his *System* and his *Short Introduction*, reveal his continuing commitment to the moral sense theory and all that presupposes, these works more noticeably reflect his need, after 1729, to offer lectures on a broad range of moral issues - issues of practice as well as principle - to largely adolescent audiences. Making extensive use of writers in the modern natural law tradition (Grotius, Pufendorf, and Richard Cumberland, for example), as well as of Cicero, Hutcheson in these works focuses principally on such practical issues as our duties to God, to humanity, and to ourselves; the law of nature and the rights of individuals; property and contracts; marriage and parenting; and civil government.

Hutcheson's contemporaries and students remembered him as earnestly concerned with civil and religious liberty. He was, for example, an outspoken critic of the Aristotelian or classical theory of slavery, and also of the justification of slavery by conquest. Arguing that there are no natural slaves nor ought there to be slaves by conquest, Hutcheson insists that the '*natural equality of men*' consists chiefly in the fact that 'natural rights belong

equally to all', and that the laws of God and nature prohibit even the most powerful from depriving the least powerful of their rights, or from inflicting any harm on them. The least talented humans have the use of reason and thus have vastly greater capacity for happiness or misery than do animals. All humans 'have strong desires of liberty and property, have notions of right, and strong natural impulses to marriage, families, and offspring, and earnest desires of their safety…. We must therefore conclude, that no endowments, natural or acquired, can give a perfect right to assume powers over others, without their consent'. This, he adds, 'is intended against the doctrine of Aristotle, and some others of the ancients, "that some men are naturally slaves"' (1755, I: 299-301). Equally abhorrent is the view that those taken prisoner in a just war may be justly enslaved as punishment or security against further offence. No 'damage done or crime committed can change a rational creature into a piece of goods void of all right, and incapable of acquiring any [rights]' (1755, II: 202-3). Those who claim that Africans were better off as slaves than they would have been if left in Africa have let custom and the prospect of profit stupefy their consciences until they have lost all sense of natural justice (1755, II: 84-5).

At the heart of Hutcheson's political theory is his endorsement of the principle that the safety of the people is the supreme law. He insists that there are specifiable limits to the powers of the state, and that citizens retain the right to resist the excesses of any form of government and even the right to overthrow and replace a government. Consequently, any government that fails to function for the 'safety and happiness of the whole body' can be legitimately abolished (1742b: 303). Hutcheson explicitly applied these principles to colonies. Colonial subjects also have a right to legitimate - that is, beneficial - government. If they fail to receive such government, and are oppressed, they may justly overthrow their oppressor: 'the people's right of resistance is unquestionable' (1742b: 292).

Hutcheson's writings had a substantial influence in the eighteenth century. His claim that ill-governed colonies have the right to rebel was widely and effectively repeated in colonial north America, and may rightly be taken as having provided many patriots with a philosophical rationale for rebellion. His published views on natural equality and natural rights were reprinted in colonial Philadelphia, where they added philosophical weight to the anti-slavery movement. His moral sense ethics, although much criticized by rationalists, gained partial allegiance from David Hume. His best-known student, Adam Smith, learned from him both moral and economic theory, and credits Hutcheson as 'being the first who distinguished with any degree of precision in what respect all moral distinctions … are founded upon immediate sense and feeling' (Smith 1759: 321). Even Immanuel Kant, a moralist so apparently different, was initially attracted by, and always respectful of, Hutcheson's contributions to moral theory. And if Jeremy Bentham thought the theory of the moral sense was simply totally unconvincing, he none the less adopted as fundamental to his utilitarian theory a principle that Hutcheson had enunciated, namely 'that Action is best, which procures the greatest Happiness for the greatest Numbers' (1725a: 181).

DAVID FATE NORTON

List of works

Hutcheson, F. (1969-71) *Collected Works*, ed. B. Fabian, Hildesheim: Olms, 7 vols. (A facsimile edition of the works listed below, with the exception of the items found in (1724).)

Hutcheson, F. (1724) 'Reflections on the Common Systems of Morality', *The London Journal*; repr. in *Francis Hutcheson: Two Texts on Human Nature*, ed. T. Mautner, Cambridge: Cambridge University Press, 1993.(The two texts are Hutcheson's brief account of the systems of morality (1724), and a translation of his inaugural lecture on the social nature of man (1730).)

Hutcheson, F. (1725a) *An Inquiry into the Original of our Ideas of Beauty and Virtue; In Two Treatises*, London and Dublin; revised 1726, 1729, 1738.(The two treatises are: I, *An Inquiry concerning Beauty, Order &c*. and II, *An Inquiry concerning Moral Good and Evil*. These constitute Hutcheson's initial attempt to show that we are equipped with aesthetic and moral senses that enable us to recognize beauty and virtue.)

Hutcheson, F. (1725b) Letters to *The London Journal*.(Hutcheson's letters of June and October were in response to critical letters by Gilbert Burnet the Younger, who objected to Hutcheson's attempt to found morality in human nature. The complete exchange is reprinted in *Collected Works*, 1969-71, vol. 7.)

Hutcheson, F. (1725c) 'Reflections upon Laughter', *The Dublin Weekly Journal*. repr. in *Collected Works*, 1969-71, vol. 7.(Three letters criticizing Hobbes' account of laughter and of human nature.)

Hutcheson, F. (1725d) ‘Remarks upon the Fable of the Bees’, *The Dublin Weekly Journal*; repr. in *Collected Works*, 1969-71, vol. 7.(Three letters criticizing Mandeville’s egoistic account of morality.)

Hutcheson, F. (1728) *An Essay on the Nature and Conduct of the Passions and Affections: With Illustrations on the Moral Sense*, London and Dublin, revised, 1728, 1730, 1742.(Hutcheson’s account of the passions and a further explication and defence of the moral sense theory.)

Hutcheson, F. (1730) *De naturali hominum Socialitate Oratio Inauguralis (Inaugural Lecture on the Social Nature of Man)*, Glasgow; repr. in *Francis Hutcheson: Two Texts on Human Nature*, ed. T. Mautner, Cambridge: Cambridge University Press, 1993.(1993 is a recent translation, with helpful notes.)

Hutcheson, F. (1742a) *Metaphysicae synopsis: ontologiam et pneumatologiam complectens (Synopsis of Metaphysics: Comprising ontology and pneumatology)*, Glasgow; repr. in *Collected Works*, vol. 7, 1969-71. (Apparently lecture notes from Hutcheson course on metaphysics, published without his consent; revised by Hutcheson 1744-5.)

Hutcheson, F. (1742b) *Philosophiae moralis institutio compendiaria*, Glasgow; trans. *A Short Introduction to Moral Philosophy*, Glasgow, 1747. (A comprehensive survey, based on Hutcheson’s lectures, of the elements of ethics and the law of nature. The translation is thought most likely to be by Hutcheson or his colleague and friend James Moor.)

Hutcheson, F. (1755) *A System of Moral Philosophy*, Glasgow.(Written by 1738, but published posthumously by Hutcheson’s son, Francis the Younger. A comprehensive account of morality in three books. Includes discussions of human nature, the supreme good, and of our natural and civil duties.)

Huxley, Thomas Henry (1825-95)

Huxley, an English zoologist with strong philosophical interests, originally influenced by K.E. von Baer's embryological typology, became an authority first in invertebrate zoology and then in vertebrate palaeontology. After the publication of Darwin's On the Origin of Species, he proclaimed his acceptance of the theory of evolution, but disagreed on important points and applied common descent - but not natural selection - in his scientific works only after reading Ernst Haeckel's Generelle Morphologie (1866). He published extensively in anthropology, ethnology, philosophy, religion, politics and ethics, and was a great popularizer of science.

Thomas Henry Huxley, a leading exponent of nineteenth-century evolutionism, was born in Ealing, near London. After studying medicine he sailed, in 1846, as assistant surgeon on board HMS *Rattlesnake* in the southern hemisphere. His brilliant voyage observations would further his scientific career, but he secured a stable job only in 1854 at the School of Mines in London. His fame and authority grew with time and by 1883 he was President of the Royal Society, but had to resign in 1886 because of a breakdown.

The traditional view of Huxley as a staunch Darwinist was challenged by scholars in the 1970s, and now he is generally seen as an evolutionist but not of the Darwinian kind. An admirer of German culture and conversant with the language, he interpreted morphology in the light of Baer's embryological typology - animal forms classified according to four separate structural plans determined through embryological development.

Desirous to combat both the Platonic interpretation of animal type and the influence in scientific circles of Richard Owen, the leading British morphologist of the time, Huxley and he were often at odds. Before the publication of Darwin's *On the Origin of Species* (1859) Huxley opposed evolutionary views, both Lamarck's and those of Robert Chambers, the 'anonymous' author of the popular *Vestiges of the Natural History of Creation*.

When the *Origin* appeared, Huxley wrote two predominantly positive reviews of it, after which he often assumed in public the role of official spokesman ('bulldog', he called it) of Darwin's group. He saw two reasons for supporting Darwin's views: (a) it identified a vera causa of the production of species; (b) it was a valid hypothesis of the order of nature based on natural processes. But it was a hypothesis and not yet the theory of species, since there was no decisive experimental proof that natural selection had produced, from one species, another infertile with it. Huxley conceived the value of a theory as 'absolute'; a theory can be isolated and individually assessed in a context of truth and falsity provided by experimentally ascertained facts. For Darwin, on the other hand, if the consequences of a hypothesis are in accordance with a number of facts to be explained, the hypothesis gains explanatory power which justifies its retention. Huxley constantly played down natural selection, and never accepted Darwin's gradualism, but supported a saltatory view of evolution, probably a remnant of his originally discontinuous view of type organization. After his famous Oxford clash with Bishop Wilberforce on human descent in 1860, Huxley became popularly known as a champion of Darwinism, but his scientific production does not show any deployment of evolutionary reasoning until 1868. Even his 1863 'Man's Place in Nature', though showing anthropomorphic apes morphologically closer to humans than to lower primates, and thus providing evidence for Darwin's views, made little reference to evolution, being mainly an attack on Owen's systematics. Only after reading Haeckel's *Generelle Morphologie* (1866), which presented a reinterpretation of embryological typology in evolutionary terms and emphasized descent rather than natural selection, did Huxley introduce evolutionism into his science (see Haeckel, E.H.). Thus Huxley related evolution to the scientific tradition to which he belonged.

In ethnology, Huxley denied a role for philology in human taxonomy, and fought the polygenic view of human origins. Huxley popularized science and devoted much time to teaching. He followed with interest philosophical debates, and wrote on Descartes with appreciation for his view of knowledge and of animals as automata. He respected Mill, but loathed the positivist movement, both French and British. Possibly it was through his acquaintance with Darwin's views that he approached Hume's philosophy, on which he wrote (1878). He applauded Hume's view of the connection between common sense and scientific discourse, and of the untenability of the evidence for miracles (see Hume, D. §2), a subject on which Huxley argued with Gladstone. The term 'agnostic' was coined by Huxley to denote the scientific refusal to make statements in fields which, like theology, were outside the scope of his research. His latter publications concerned the debate on evolution and ethics, in

which he opposed Spencer's naturalistic ethics (see Spencer, H.), arguing for a complete separation of knowledge from values, opposing*laissez-faire* policy in favour of state intervention, but critical at the same time of socialism. He was concerned at the extreme individualism of his time and believed that only through science was the progress of humankind possible; that human suffering could not be explained or justified scientifically. Huxley thought that in the course of evolution, higher degrees of consciousness had arisen with humankind, and with them, a higher awareness of suffering.

MARIO A. DI GREGORIO

List of works

Huxley, T.H. (1893-4) *Collected Essays*, London: Macmillan, 9 vols.(Huxley edited these volumes that contain most of his works.)

Huxley, T.H. (1898-1903) *The Scientific Memoirs of Thomas Henry Huxley*, eds G. Foster and E.R. Lankester, London, 4 vols and suppplement.(Contains original writings; hereafter referred to as *Scientific Memoirs*.)

Huxley, T.H. (1849) 'On the Anatomy and Affinities of the Medusae', *Philosophical Transactions of the Royal Society of London* 2: 413; repr. in *Scientific Memoirs*, 1: 9-32.(Huxley determined the homology of jellyfish and established the ground for the germ-layer theory later developed by Alexander Kowalewsky, Ernst Haeckel and E.R. Lankester).

Huxley, T.H. (1853) 'On the Morphology of the Cephalous Mollusca, as illustrated by the Anatomy of Certain Heteropoda and Pteropoda collected during the Voyage of HMS *Rattlesnake* in 1846-50', *Philosophical Transactions of the Royal Society of London* 1: 43, Part 1, 29-66; *Scientific Memoirs* 1: 152-93.(Huxley endeavoured to interpret the type, then the basic concept in morphology, in an empirical manner, as denoting a form which summarises and encapsulates the characteristics of a zoological group, thus distancing himself from Platonic metaphysics.)

Huxley, T.H. (1857-9) 'On the Theory of the Vertebrate Skull', *Proceedings of the Royal Society of London* 9: 381-57; repr. in *Scientific Memoirs*, 1: 538-606.(Huxley attacked Owen's view of the vertebral theory of the skull. With the support of comparative embryology he endeavoured to show the untenability of Owen's anatomical interpretation of the skull as formed by expanded vertebrae.)

Huxley, T.H. (1859) 'The Darwinian Hypothesis', *The Times* 26 December; repr. in *Collected Essays* 2: 1-21.(A review of Darwin's *Origin*.)

Huxley, T.H. (1860) 'The Origin of Species', *Westminster Review* 17: 541-70; repr. *Collected Essays* 2: 22-79. (Another review of Darwin's *Origin*.)

Huxley, T.H. (1863) *Evidence as to Man's Place in Nature*, London: Williams & Norgate; repr. in *Collected Essays* 7: 1-208.(This book, in fact a collection of papers, sprang from Huxley's controversy with Owen on the presence of the hippocampus minor in the cerebellum of both man and ape, which Owen denied and Huxley maintained. Owen intended to separate man and apes into different subclasses, while Huxley defended Linnaeus' traditional classification, which was in no way evolutionary.)

Huxley, T.H. (1863) 'On Our Knowledge of the Causes of the Phenomena of Organic Nature'; repr. in *Collected Essays* 2: 303-475.(A series of popular lectures on various aspects of natural science including Darwin's theory).

Huxley, T.H. (1868) 'On the Animals which are Most Nearly Intermediate between Birds and Reptiles', *Geological Magazine* 5: 357-65; repr. in *Scientific Memoirs* 3: 303-13.(Dinosaurs as link between birds and reptiles).

Huxley, T.H. (1869) 'The Scientific Aspects of Positivism', *Fortnightly Review* 5: 653-70.(Huxley called Comte's philosophy 'Catholicism minus Christianity'.)

Huxley, T.H. (1874) 'On the Hypothesis that Animals are Automata, and its History', *Nature* 10: 362-6; repr in *Collected Essays* 1: 199-250.(Huxley discusses Descartes' view that animals are automata.)

Huxley, T.H. (1874) 'Universities, Actual and Ideal', *Contemporary Review* 23: 657-79; repr. in *Collected Essays*, 3: 189-234.(On teaching and research in the reorganization of British universities.)

Huxley, T.H. (1878) *Hume*, London: English Men of Letters Series; repr. in *Collected Essays* 6: 3-240.(A thorough analysis of Hume's philosophy.)

Huxley, T.H. (1889) 'Agnosticism', *Nineteenth Century* 25: 169-94; repr. in *Collected Essays* 5: 209-62. (Huxley's refusal of both Atheism and traditional Christian theology.)

Huxley, T.H. (1893) 'Evolution and Ethics' *Collected Essays* 9: 46-116.(Huxley's criticism of naturalistic ethics.)

Huxley, T.H. (1894) ‘Prolegomena to "Evolution and Ethics"’, *Collected Essays* 9: 1-45.(Huxley elaborates on the themes discussed in *Evolution and Ethics*.)

Hypatia (*c.* AD 370-415)

The Greek philosopher Hypatia was a Neoplatonist. She was famous for her public talks on philosophy and astronomy, and her forthright attitude to sex. Alhough concerned with higher knowledge, she was also a political animal and had a keen sense of practical virtue. She was killed by a Christian mob, and has remained since a martyr to the cause of philosophy.

Hypatia was born in Alexandria around AD 370. However, according to one source she was 'aged' (*palaia*) in AD 415, which has led some to propose she was born around AD 355 (Dzielska 1995: 68). She was educated by her father Theon, who wrote important treatises on mathematical astronomy. But in what field did she flourish? This presents the first of several fascinating problems of interpretation. The works ascribed to her (none survives) are exclusively mathematical commentaries: *On Diophantus* (a third-century Alexandrian mathematician and the first to use algebra), *On the Conic Sections of Apollonius* and *On the Astronomical Canon* (of Ptolemy). Furthermore, when Damascius (a sixth-century Alexandrian Neoplatonist, who became head of the Athenian school) compared her to his teacher, he deemed her to be 'much different from him, not only as woman is to man, but also as a geometer is to a real philosopher' (Damascius, *Life of Isidore*, fr. 164.1-2). On the other hand, 'she was more courageous than her father and was not content with her mathematical education but boldly reached up to the other philosophy' (*Suda* U166.13-5). (For this passage from astronomy to knowledge of the Forms, see Plato, *Republic* 529a9.) 'She outdid the philosophers of her time…. Those interested in philosophy run to her from everywhere' (Socrates, *Ecclesiastical History* 7.15), and for Hypatia's eminent student, Synesius (first pagan, then Christian bishop of Cyrene and statesman), she surpassed the Athenian 'sophists' (Synesius, *Letters* 136.17-21). So, her intellectual home may have been the mathematical quadrivium - traditionally part of Platonism - but she dared to do exceptionally well in metaphysics.

What was her philosophy? According to one statement, 'she succeeded to the Platonic school that descended from Plotinus' (*Socrates' Ecclesiastical History*, 7.15.5). According to another, 'she explained Aristotle or Plato or some other philosopher' (*Suda* U166.17-9). Furthermore, 'the woman wore a rough mantle (*tribōn*) and made public appearances at the centre of the city' (U166.16). However, the last two tell nothing special. The rough mantle, although originally of the Cynics, was often the habit of the plain-living philosopher (for example, the Stoics). Interpretation of Aristotle, Plato or others was carried out by most philosophers, including the Neoplatonists and Ammonius Saccas, the Alexandrian teacher of Plotinus. So, Hypatia must have followed Neoplatonism, probably as a result of Porphyry's dissemination (see Neoplatonism). Her students included both pagans and Christians.

What was her stand on gender issues? Men extolled her 'exceptional' beauty, her flair for public speaking and her capacity to do things unexpected of a woman in that society. Male followers were enamoured of her intellectually and emotionally. How did she cope? On one celebrated occasion, to temper a love-sick student she removed her bloody sanitary towel, threw it at him and told him 'this is what you really want, young man, and it is no good' (Damascius, *Life of Isidore* 102). This agrees with other descriptions of her as 'solemn' and 'virgin/unmarried to the end'. But, these were the very attitudes cultivated equally by select male philosophers (see, for example, Proclus §1). Hypatia upheld the Platonic, or generally philosophical, freedom from bodily concerns, to rise above sex altogether.

These elements, and others, are brought into sharp focus when the possible reasons for her gruesome murder are considered. Some jealousy was to blame, fuelled by her political prominence when secular civic authority was being challenged by the ambitious bishop Cyril. Was the acrimony purely local? Was it intellectual or religious (shared belief in astrology and paganism)? Was it personal (the result of Hypatia's friendship with the city's Governor)? Whatever the complex truth, Hypatia soon came to be seen as martyr in the hands of the Christian mob. In modern times, criticism of the Victorian novel *Hypatia* by C. Kingsley (London, 1853) has brought to the fore the gender aspects, and, more recently, 'Hypatia' has become the name of two philosophy journals on feminism.

Iamblichus (*c.* AD 242-327)

The late ancient philosopher Iamblichus was, alongside Plotinus and Porphyry, a founder of Neoplatonism. He established a new curriculum for the teaching of philosophy and formulated many distinctions that pervaded later Neoplatonic metaphysics. He began to mathematize all fields of philosophical concern. Most of all, he asserted that acts of transcendence, not contemplation, secure union with the divine, because it can only be reached by an equally divine faculty, which is present in every individual. Matter, soul and mind contain images of the divine and so are genuine participants in salvation.

Details of Iamblichus' life are scant. He was born at Chalcis, a descendant from an ancient line of priest-kings of Syria. In the AD 270s he studied at Caesarea (where many Christian theologians flourished). Perhaps he was still there when he heard of Porphyry, and may have visited him in Italy. They split in the AD 290s over theurgy, and Iamblichus' chief surviving work, *On the Mysteries*, is a record of their disagreement. He went to teach philosophy at Apamea (Syria), where the Neo-Pythagorean Numenius, and more recently Plotinus' chief follower Amelius, had flourished. The school he set up became very popular. From Pergamum his envoys converted the emperor Julian from Christianity, influencing the Athenian school of philosophy, and through it the Alexandrian school.

Iamblichus took further the programme of 'harmonization' of Greek philosophies that had been started by Porphyry: Aristotle agreed with Plato even on the Theory of Forms and on learning as recollection. He designed a curriculum for the teaching of Plato which had Aristotle as a prerequisite (see Neoplatonism §2). He also wrote grand commentaries on the two philosophers. However, he considered Pythagoras the supreme authority. Iamblichus saw number as the essence of Forms and things, and promised to make philosophy and theurgy scientific. His many treatises on Pythagoreanism mark a revival of the movement. Eight or so titles of his large number of works survive, along with reports in Proclus, Damascius and Simplicius. Later Neoplatonists were wary of Iamblichus' claims about Aristotle and Plato, but maintained his curriculum, his metaphysical distinctions and his emphasis on mathematics.

Iamblichus introduced radical revisions to Plotinus' philosophy, multiplying the ranks of being (see Plotinus §§3-4). Plotinus saw the metaphysical levels as areas of the soul's activity, with flexible and sometimes conflicting properties. Iamblichus separated psychology from ontology, and looked for distinct properties and substances in the anatomy of things. He also distinguished the 'imparticipable' from the 'participated'. Every class of things has a first principle, which retains its pure definition by being exempt from its members.

The Neoplatonic One was inferred by stripping away all attributions, but was also the first cause of being. How could the same thing transcend its products, and also be in a causal relation to them? Iamblichus promptly introduced two Ones (later Neoplatonists reverted to a single One). At the level of intellect (see Nous), he distinguished the acts of thought - the 'intellective' - from their objects - the 'intelligible'. At the level of soul (*psychē*), he separated the individual soul from the higher: in contrast to Plotinus, for Iamblichus the individual soul descends entire into the body (see Psychē). Similarly Iamblichus distinguished not only between time and timelessness, but also between a pure, eternal time and ordinary time, which is flowing.

To describe the essential nature of things, and the 'flow' or 'procession' from unity to diversity, Iamblichus turned to Neo-Pythagorean metaphysics of number. He believed that things are organized by number and relate to each other in mathematical proportion. The 'divine numbers' distribute the unity of the One to things and render them coherent. The 'intelligible numbers' stand as paradigms of the many species of reality. Intellect is organized by 'intellective numbers'. Soul exemplifies the 'mathematical numbers'. Last are the 'physical numbers', the forms immanent in matter.

Iamblichus' conclusion that the soul descends entire into matter had profound consequences. Individual souls are dominated by physical necessities (which fits with Aristotle's definition of soul as the form of biological body). But soul is still essentially divine and rational. So the embodied soul presents an uncomfortable mystery. It contains an immortal, intelligent, divine nature, but is genuinely part of a mortal, concrete, imperfect domain. The personal soul has lost touch with its deeper nature and has become self-alienated.

Iamblichus' analysis was that the transcendent cannot be grasped with mental contemplation, because the

transcendent is supra-rational. Theurgy, literally 'divine-working', is a series of rituals and operations aimed at recovering the transcendent essence by retracing the divine 'signatures' through the layers of being. Education is important for comprehending the scheme of things as presented by Aristotle, Plato and Pythagoras but also by the Chaldaean Oracles (see Chaldaean Oracles). The theurgist works 'like with like': at the material level, with physical symbols and magic; at the higher level, with mental and purely spiritual practices. Starting with correspondences of the divine in matter, the theurgist eventually reaches the level where the soul's inner divinity unites with God.

Ibn ‘Adi, Yahya (893-974)

Following in the footsteps of the Greek philosophers, Ibn ‘Adi concerned himself with the ultimate human end, happiness, which he found in knowledge. However, he was primarily occupied with defending the compatibility between the concept of God’s unity and that of the trinity. He reasoned that a thing can be one in one respect and many in another. Therefore, there is no inconsistency in holding that God is both one and three. Ibn ‘Adi can best be described as the Christian philosopher of unity, as he devoted most of his career and used all his logical skills to defend the concept of God’s unity and its consistency with the concept of trinity.

Ash-Shaykh Abu Zakariyya’ Yahya ibn ‘Adi was a Jacobite Christian who lived in Iraq. Born in Takrit, he moved as a youth to Baghdad, one of the most important centres of learning in the tenth century. Of Syriac origin, he was Arabized like many other Syriacs at that time. He learned logic and philosophy with the well-known logicians, Abu Bishr Matta ibn Yunis and al-Farabi, and after their deaths he became the leading logician of his time. He translated Greek philosophical works from Syriac into Arabic, wrote a number of logical, philosophical and theological treatises - the most important of which are *Tahdhib al-akhlaq (Refinement of Character)* and *Maqala fi at-tawhid (Essay on Unity)* - and established the Aristotelian school at Baghdad. His students, a mixture of Muslims and Christians, included Ibn Miskawayh, Ibn al-Khammar, who wrote a treatise on the harmony between philosophy and dogma (which may have influenced Ibn Rushd in his treatment of the same subject), and Ibn Zur‘a.

In *Tahdhib al-akhlaq*, Ibn ‘Adi sets out his ethical philosophy along Greek lines (see Ethics in Islamic philosophy). It is based on his view of the human soul, which is divided into three parts or souls: the appetitive, the courageous and the rational. The first is the lowest and is shared by humans with other animals. The last is the noblest and the distinguishing mark of being human. To follow the first is to fall into ignorance and evil; to follow the last is to adhere to goodness and happiness. While all human beings have the natural capacity for reasoning, some have the skill to reason and some do not. Those who do not may acquire it by learning the rational sciences.

Ibn ‘Adi’s concern with God’s unity, however, was his main preoccupation. He identifies the meaning of the word ‘one’ as it applies to God, and investigates whether God is one in all respects or one and many. Asserting that the one is that in which there is no otherness inasmuch as it is one, he classifies six things as one: the genus, the species, the relation, the continuous, the indivisible and the definition. He then offers arguments to show that God cannot be one except in the sense of definition (definition being a descriptive statement of the essence of a thing, in that it gives the essence as it is). Since every definition mirrors an essence, God must also be one in essence.

Most Greek and medieval philosophers considered God indefinable. A definition, they say, includes a genus and a difference, such as ‘animality’ and ‘rationality’ for ‘humanity’. God, being simple, cannot be included in any genus because there is nothing above him. But if he has no genus, he cannot have any difference, for the difference is what differentiates a genus. Without a genus and a difference, God cannot be defined. While agreeing that a definition requires a genus and at least one difference, Ibn ‘Adi believes that God is definable because he falls under the genus ‘substance’, for like every substance he does not reside in anything. This is interesting because it places something, the genus ‘substance’, above God and makes him the cause of the substance out of which he is made. This follows from Ibn ‘Adi’s view that the genus is caused by its members and that God is the cause of everything. The difficulty then arises that there was a time when God had no substance.

Ibn ‘Adi asserts that God is one in one respect and multiple in another. As stated earlier, God is one in definition and in essence. However, a definition is a statement, and every statement has its parts. Such parts signify separate meanings. As such, these parts are separate definitions. Thus there is no contradiction between saying that God is one in definition and multiple in definition. The multiple definitions of God signify the three attributes, goodness, power and wisdom, referred to in Ibn ‘Adi’s later works as intellect, act of intellection and object of intellection, respectively. Goodness signifies the Father; power signifies the Holy Spirit; and wisdom signifies Christ. The same thing may be reflected in two mirrors differently, in one as a cause and in the other as an effect. Similarly, God and the Trinity are one in essence but different as individuals. Observation of God’s creatures demonstrates these attributes.

The third century AH (ninth century AD) Muslim philosopher al-Kindi wrote a treatise attempting to refute the

Christian concept of the Trinity purely on the basis of logical reasoning. This treatise is, as far as we know, preserved only in the writings of Ibn ‘Adi. Al-Kindi asserts that, according to Christianity, the three figures of the Trinity share substance or essence, but each is an individual by virtue of a specific property. The substance plus this property makes every one of them a composite. However, every composite is caused, and whatever is caused cannot be eternal. Ibn ‘Adi responds that it is true that the three figures are composite individuals by virtue of their substance and properties, but their being composite does not make them caused, because it is possible for a thing to be composite eternally if the parts were not separate before the composition.

Platti, E. (1983) *Yahya Ibn ‘Adi, théologien chrétien et philosophe arabe: sa théolgie de l’Incarnation (Yahya Ibn ‘Adi, Christian Theologian and Arab Philosopher: His Theology of the Incarnation)*, Orientalia Lovanensia analecta vol. 14, Leuven: Departement Orientalistiek.(Deals with a major theme in Ibn ‘Adi’s thought.)

Ibn al-‘Arabi, Muhyi al-Din (1164-1240)

Ibn al-‘Arabi was a mystic who drew on the writings of Sufis, Islamic theologians and philosophers in order to elaborate a complex theosophical system akin to that of Plotinus. He was born in Murcia (in southeast Spain) in AH 560/AD 1164, and died in Damascus in AH 638/AD 1240. Of several hundred works attributed to him the most famous are al-Futuhat al-makkiyya (The Meccan Illuminations) and Fusus al-hikam (The Bezels of Wisdom). The Futuhat is an encyclopedic discussion of Islamic lore viewed from the perspective of the stages of the mystic path. It exists in two editions, both completed in Damascus - one in AH 629/AD 1231 and the other in AH 636/AD 1238 - but the work was conceived in Mecca many years earlier, in the course of a vision which Ibn al-‘Arabi experienced near the Kaaba, the cube-shaped House of God which Muslims visit on pilgrimage. Because of its length, this work has been relatively neglected. The Fusus, which is much shorter, comprises twenty-seven chapters named after prophets who epitomize different spiritual types. Ibn al-‘Arabi claimed that he received it directly from Muhammad, who appeared to him in Damascus in AH 627/AD 1229. It has been the subject of over forty commentaries.

*Although Ibn al-‘Arabi was primarily a mystic who believed that he possessed superior divinely-bestowed knowledge, his work is of interest to the philosopher because of the way in which he used philosophical terminology in an attempt to explain his inner experience. He held that whereas the divine Essence is absolutely unknowable, the cosmos as a whole is the locus of manifestation of all God’s attributes. Moreover, since these attributes require the creation for their expression, the One is continually driven to transform itself into Many. The goal of spiritual realization is therefore to penetrate beyond the exterior multiplicity of phenomena to a consciousness of what subsequent writers have termed the ‘unity of existence’. This entails the abolition of the ego or ‘passing away from self’ (*fana’*) in which one becomes aware of absolute unity, followed by ‘perpetuation’ (*baqa’*) in which one sees the world as at once One and Many, and one is able to see God in the creature and the creature in God.*

1 Epistemology

While still an unbearded youth, Ibn al-‘Arabi was introduced by his father to the celebrated philosopher Ibn Rushd, who eagerly questioned him about his spiritual experiences. Ibn al-‘Arabi describes the interview as follows:

> He said, ‘How did you find the situation in unveiling and divine effusion? Is it what rational consideration gives us?’ I replied, ‘Yes and no. Between the yes and the no spirits fly from their matter and heads from their bodies.’
>
> (*al-Futuhat al-makkiya* I.154, in Chittick 1989: xiii)

This cryptic answer, which reputedly made the philosopher turn pale and tremble, implies the existence of divinely-bestowed knowledge which is superior to knowledge gained by ‘rational consideration’ (*nazar*). But what precisely is the relationship between them? Elsewhere, Ibn al-‘Arabi speaks not of two levels of knowledge, but of three (for example, in *al-Futuhat al-makkiya* I.31). First, there is ‘knowledge based on reason’ (*‘ilm al-‘aql*), that is, knowledge which can be acquired by rational consideration. Here he probably has in mind the principal tenets of Muslim theology rather than the a priori self-evident propositions of logic and mathematics. Second, there is knowledge based on states (*‘ilm al-ahwal*), which is what we would call empirical knowledge. He gives as examples the sweetness of honey, the bitterness of aloes and the pleasure of sexual intercourse, none of which can be known without ‘tasting’ them. Third, there is ‘knowledge of mysteries’ (*‘ulum al-asrar*) - sometimes called ‘gnosis’ (*ma‘rifa*) - which is specific to prophets and saints and is akin to Spinoza’s *scientia intuitiva* (see Spinoza, B. de) It is futile to strive for this third type of knowledge, for it lies concealed in every man but is only unveiled when the divine light is effused into the hearts of those who are predisposed to receive it. ‘Knowledge of mysteries’ includes knowledge of the first type, except that it is acquired without reflection, and knowledge of the second type but pertaining to higher states not experienced by lesser mortals; potentially it embraces everything except the unknowable Essence. It is nothing short of divine knowledge for, in the words of the celebrated *hadith qudsi* (extra-Qur’anic revelation), when God loves his servant he becomes ‘the hearing with which he hears, the sight with which he sees’.

The distinctly subordinate role given to reason in Ibn al-‘Arabi’s epistemology appears at first to be out of step with the Qur’an, which repeatedly urges man to engage in ‘rational consideration’ and ‘reflection’ (see Epistemology in Islamic philosophy). In his view however, there is no real tension because the main purpose of considering and reflecting is to lead man to the realization that he cannot reach knowledge of God through his unaided reason. This is illustrated in Chapter 167 of *al-Futuhat al-makkiyya (The Meccan Illuminations)*, in which the progressive journey of the gnostic and the philosopher towards the truth is depicted in terms of a heavenly ascent akin to that experienced by Muhammad (the *mi‘raj*). As they pass through each of the celestial spheres the gnostic is addressed by their spirits - the prophets who inhabit each sphere - and perceives their inner reality. The philosopher, on the other hand, learns only the phenomenal or apparent and becomes increasingly perplexed and sceptical until he finally becomes a Muslim and follows the path of the gnostic (see Gnosticism).

2 Theology

Although Ibn al-‘Arabi has often been labelled a pantheist, he was far too subtle a thinker to have subscribed to the doctrine that God is everything and everything is God (see Pantheism). He believed that God *per se* - whom he called ‘the Real’ (*al-Haqq*) or ‘the Essence’ (*al-dhat*) - is absolutely unknowable because he transcends all humanly conceivable qualifications. God’s ‘names’ (*asma’*) or ‘attributes’ (*sifat*), on the other hand, are the relationships which can be discerned between the Essence and the cosmos. They are known to God because he knows every object of knowledge, but they are not existent entities or ontological qualities, for this would imply plurality in the godhead. It may help to understand the status of the ‘names’ (which of course must not be confused with ‘the names of the names’ known to us from the Qur’an and Islamic tradition) if we draw an analogy with the complex web of interpersonal human relationships. One and the same individual may be known to others variously as teacher, pupil, friend, enemy, father, son, brother, husband, lover and so forth. A man who knows another as his friend genuinely knows him, but does not necessarily know him as his teacher or his father and cannot know him as he is in himself without regard to others. Similarly, to know God as the All-Merciful, for instance, does not entail knowing him as the Vengeful or the Abaser, nor does it mean knowing his Essence even though each of the names denotes the Essence. The analogy must not be pressed, however, because unlike human beings, whose relationships are temporal, God has possessed the divine names from all eternity.

Thus far Ibn al-‘Arabi’s theology remains within the confines of Islamic *kalam*, although he seems in some ways to have more affinity with the Mu‘tazila than with the Ash‘ariyya (see Ash‘ariyya and Mu‘tazila; Islamic theology). However, he differs markedly from both in holding that, not withstanding the fact that in his Essence, God is independent of the cosmos, his names none the less seek the creation, for without it they would remain virtualities. The cosmos as a whole is the locus of their manifestation and it is only through it that their properties can be seen and understood. Moreover, since all the creatures in the cosmos and everything which they make or do are God’s ‘acts’ (*af‘al*), God is present everywhere and the all-inclusive name Allah may be used to denote the sum total of all things: divine Essence, divine names and divine acts. Nevertheless, since creatures have only relative existence (see §3), it also has to be said that he is nowhere to be found (see God, concepts of).

3 Ontology

In agreement with the Islamic philosophers, Ibn al-‘Arabi distinguishes between the essence or ‘quiddity’ (*mahiyya*, literally the ‘what is it?’) of a thing and its ‘existence’ (*wujud*, literally its ‘being found’), holding that the former is mentally separable from the latter. That is, one can define the nature of things (unicorns, pink elephants and so forth) regardless of whether or not they are actually found as phenomena. He also accepts the distinction between necessary being (*wajib al-wujud*), impossible things and possible things. The necessary being is God, the one reality who cannot not exist because his quiddity is being (see Being). Impossible things are things which cannot exist as phenomena although they may subsist in the imagination (see §5). Possible things are things which become ‘existent entities’ (*a‘yan mawjuda*) when God chooses to give them existence; their existence or non-existence at any given time depends on his will. They have, however, been known to him eternally as ‘immutable entities’ (*a‘yan thabita*). This latter term is rendered by Affifi (1938: 47) as ‘fixed prototypes’ and Izutsu (1983: 159) as ‘permanent archetypes’, expressions which suggest that like the Platonic Ideas they are the original models of which objects in the phenomenal world are multiple copies (see Universals). Chittick (1989: 84) objects to this on the grounds that although the ‘immutable entities’ actually become the ‘existent entities’, they are the things themselves prior to their being given existence in the world. Although I have adopted his translation

as closer to the meaning of the Arabic, I have reservations about his interpretation, for there are passages in Ibn al-‘Arabi’s writings which seem to imply that some of the immutable entities are universals. Nevertheless it may well be the case that Ibn al-‘Arabi’s views on this subject were not entirely consistent.

Another problem area is Ibn al-‘Arabi’s lack of precision in using the word *wujud* to mean both ‘existence’ and ‘Being’. It was stated above that possible things become existent entities when God gives them existence, but it must be stressed that the existence which he gives them is relative existence. They become the ‘loci of manifestation’ (*mazahir*) of the names of God, who, as Essence, is alone Being in the strict sense. Another way of putting it is to say that each entity becomes a receptacle for Being, but that since entities differ from one another, they differ also in their capacity to function as vehicles of his self-manifestation.

4 The ‘perfect man’ and the Muhammadan reality

The first chapter of the *Fusus al-hikam (The Bezels of Wisdom)* is entitled ‘The Wisdom of Divinity in the Word of Adam’. It begins with the assertion that the Real created the cosmos as an all-inclusive object in which he could contemplate the entities of his names, but that until he created Adam and breathed his spirit into him, the cosmos remained like an unpolished mirror. Here Ibn al-‘Arabi’s idea seems to be that the cosmos as a whole - the totality of existent entities - manifests all the divine names but does so in a diffuse way, whereas man, as a microcosm endowed with consciousness, brings them into sharp focus as a unity. Potentially every man is a microcosm, but in practice men differ in their polishing of the cosmic mirror, with only a select few realizing their primordial nature. These are the prophets and saints, all of whom belong to the category of ‘the perfect man’ (*al-insan al-kamil*). They alone assume the character traits of God, which are latent in all human beings, and manifest them in perfect equilibrium.

Muhammad is the ‘perfect man’ *par excellence*. Basing his argument on the *hadith* (sayings of the Prophet), ‘I was a prophet when Adam was between water and clay’, Ibn al-‘Arabi propounds the view that as ‘the Muhammadan reality’ (*al-haqiqa al-Muhammadiyya*), Muhammad is identical with ‘the first intellect’ (*al-‘aql al-awwal*), the eternal principle unifying the immutable entities. All the other prophets, beginning with Adam, only became prophets during their historical mission; each was the bearer of a fragment of this Muhammadan reality in a particular place and time, a bezel in which a jewel of the divine wisdom was displayed. None the less, after their mission the prophets continued to exert an influence through the saints who were their spiritual heirs.

5 Imagination and mysticism

The *al-Futuhat* contains a good deal of autobiographical material in anecdotal form, some of which strains credulity. For instance Ibn al-‘Arabi, who was in no doubt that he himself was one of the most important saints in the history of Islam, tells us that he met and conversed with the prophets of old including Moses, Jesus and Muhammad. On one moonlit night, when on board a ship in the port of Tunis, he allegedly encountered Moses’ spiritual guide al-Khidr, who came to him walking on the water without getting his feet wet, before going off to a lighthouse over two miles away, which he reached in two or three steps (*al-Futuhat al-makkiyya* I: 186). It is tempting to dismiss these visions as hallucinations induced by extreme ascetic practices or illness - on the occasion when he saw al-Khidr he had gone to the side of the ship because of a stomach pain which prevented him from sleeping - but Ibn al-‘Arabi offers a different explanation based on his perception of the nature of the cosmos.

In his view, the cosmos comprises a hierarchy of three distinct worlds or levels: the ‘world of spirits’, ‘the world of images’ and ‘the world of bodies’. The second of these - ‘the world of images’ (*‘alam al-amthal*), also called ‘the world of imagination’ (*‘alam al-khayal*) - plays a key role because of its intermediate position. It is the isthmus (*barzakh*) between the world of spirits and the world of bodies, the realm in which spirits are corporealized and bodies are spiritualized. The world of images is a really existent world, but in the waking state we are generally unaware of it; in our dreams, when our souls are no longer distracted by sensory input from the world of bodies, we function at this level, conversing with the departed and with those normally separated from us by geographical distances. What ordinary human beings experience only in their dreams, the mystic may experience at other times. Thus for example, when al-Khidr appeared to Ibn al-‘Arabi, this took place in the world of images, al-Khidr - who belongs to the world of spirits - being corporealized for the occasion.

The supposition of this intermediate world of images also furnishes the key to understanding both the miracles

performed by prophets and saints and some of the more bizarre descriptions of the hereafter in the *hadith*. As regards the miracles, Ibn al-‘Arabi’s starting point is the observation that we all can create things in our imagination or imagine things happening as we would like them to happen. The ‘perfect man’ is in addition endowed with extraordinary spiritual energy or *himma*, which enables him to bring the creatures of imagination out of the world of images into the world of bodies thus giving them existence. However, far from acting like a superman, he exercises restraint only employing his miraculous powers when commanded by God to do so. As regards the traditional descriptions of the hereafter, Ibn al-‘Arabi maintains that they should be understood as comparable to dream imagery. In a celebrated dream, the Prophet was given a cup of milk to drink, which in the waking state he subsequently interpreted as knowledge. What is impossible in the world of bodies - the corporealization of milk as knowledge - is perfectly possible in the world of images. Similarly in the hereafter, our works will be weighed in the scales and death will be brought in the form of a salt-coloured ram. We who are resurrected will really see these things, but we will see them in the world of images.

6 Assessment

In view of the volume of Ibn al-‘Arabi’s work, much of which is still unpublished, any assessment of his philosophy must remain highly tentative. Although he was influenced by earlier Sufis and was conversant with the works of the *falasifa* and the disputes between the Mu‘tazila and Ash‘ariyya, the dominant influence on his thought seems to have been the Neoplatonism of Plotinus as mediated by the *Epistles* of the Brethren of Purity (Affifi 1938: 174-94) (see Ikhwan al-Safa’; Neoplatonism in Islamic philosophy). Nevertheless he differs from them in at least two important respects. First, despite his use of emanationist language, it is clear that for him ‘emanation’ (*fayd*) is a figure of speech for what is more accurately described as self-revelation. Second, he does not simply take from the Qur’an and hadith convenient pegs on which to hang his doctrine, but rather offers what amounts to a profound esoteric commentary on both.

al-‘Arabi, the Book and the Law), Paris, Seuil; trans. D. Streight, *Ocean Without Shore*, Albany, NY: State University of New York Press, 1993.(A study of the hermeneutical principles which govern Ibn al-‘Arabi’s approach to the Qur’an.)

Izutsu, T. (1983) *Sufism and Taoism*, Los Angeles, CA: University of California Press.(Pages 1-283 contain the classic account of Ibn al-‘Arabi’s ontology, based primarily on *The Bezels of Wisdom* as interpreted by early Muslim commentators. The book is a revised version of *A Comparative Study of the Key Philosophical Concepts in Sufism and Taoism*, 1966-7.)

Ibn ar-Rawandi (*c*.910?)

A highly enigmatic and controversial figure in the history of Islamic thought, Ibn ar-Rawandi wavered between a number of Islamic sects and then abandoned all of them in favour of atheism. As an atheist, he used reason to destroy religious beliefs, especially those of Islam. He compared prophets to unnecessary magicians, God to a human being in terms of knowledge and emotion, and the Qur'an to an ordinary book. Contrary to Islamic belief, he advocated that the world is without a beginning and that heaven is nothing special.

Medieval biographical dictionaries agree that Ibn al-Husain Ahmad ibn Yahya ibn Ishaq ar-Rawandi lived in Baghdad, but differ as to the form of his name and the date of his death, and indicate that he was intellectually unstable and that very little was known about his real thought. While he is best known as ar-Rawandi, he is also referred to as ar-Rindi, ar-Rawindi and ar-Riwindi. Also he is said to have died at a number of different dates, ranging from AH 243 to AH 301. The most accepted view is that he died about AH 245/AD 910 at the age of forty.

Islamic sources mention that Ibn ar-Rawandi was first a Mu'tazilite, then a Shi'ite and later an atheist. The same sources indicate that the Jews had warned Muslims that, as his father converted to Islam from Judaism after trying to refute the Torah, Ibn ar-Rawandi would attempt to refute the Qur'an after abandoning Islam. These sources agree that this happened, and that he wrote books for the Jews, Christians and even dualists (idolators) in which he attacked Islamic beliefs. He was said to have told the Jews to inform Muslims that Moses had said that there will not be any prophet after him. With the exception of Ibn al-Murtada (d. AH 436/AD 1044) and Ibn Khallikan (d. AH 680/AD 1283), Muslim authors distanced themselves from him and many called him 'the cursed', including Abu al-Hayyan al-Tawhidi and Abu al-'Ala' al-Ma'arri (d. AH 449/AD 1057), who themselves were considered as atheists in Islamic religious circles.

The reasons for his abandoning Mu'tazilism and later Islam entirely were a matter of controversy. Some believed that poverty pushed him to earn some money by writing books for the opponents of Mu'tazilism and Islam in general. The *Ma'ahid at-tansis (Known Citations)* of al-'Abbasi (d. AH 960/AD 1556) mentions that for four hundred dirhams Ibn ar-Rawandi wrote a book for the Jews, criticizing Islam. After he received the money he wished to refute it, but agreed not to do so after receiving one hundred dirhams more. Others were of the opinion that he abandoned Mu'tazilism because he did not reach the high positions in Mu'tazilite circles to which he aspired. Still others contended that the sense of rejection and loneliness he felt after having been isolated by the Mu'tazilites forced him to seek refuge in their opponents' circles. He himself claimed that he affiliated himself with different schools of thought, including atheism, in order to familiarize himself with their doctrines and learn from them.

Ibn ar-Rawandi's real thought remained somewhat unknown primarily because in the Middle Ages the authorities discouraged the reading of his books and banned their circulation. Most of the one hundred and fourteen books he wrote have been lost. Only parts of three of his works are extant. *Fadihat al-mu'tazila (The Scandal of the Mu'tazilites)* was preserved almost in its entirety and responded to by al-Khayyat (d. AH 300/AD 912) in *Kitab al-intisar (The Book of Victory)*. *Fadihat al-mu'tazila* is a response to *Fadilat al-mu'tazila (The Virtue of the Mu'tazilites)*, a work by al-Jahiz (d. AH 254/AD 868), in which the latter pointed out the vices of their opponents in addition to the virtues of the Mu'tazilites themselves. Following the heyday of the Mu'tazilite movement during the early Abbasid rule of al-Ma'mun, al-Mu'tasim and al-Wathiq (see Ash'ariyya and Mu'tazila), the movement felt the need to defend itself against attacks by various opponents; al-Jahiz was one of its defenders. In *Fadihat al-mu'tazila*, Ibn ar-Rawandi presents the views of all the major Mu'tazilite thinkers and tries to show that they suffered from inconsistencies. Many fragments of *ad-Damigh (A Refutation)*, another work of Ibn ar-Rawandi, are extant in Ibn al-Jawzi's *al-Muntazam fi at-tarikh (Organization in History)*. In *ad-Damigh*, Ibn ar-Rawandi attacks the Qur'an. Finally, parts of *az-Zumurrud (Diamond)* are also extant in the *Majalis (Councils)* of al-Mu'ayyad fi al-Din (d. AH 369/AD 979). In *az-Zumurrud*, Ibn ar-Rawandi focuses on proving the falsehood of prophets and prophecy, which he rejects in Islam and in general.

Ibn ar-Rawandi's tremendous courage in pursuing a rational path in religious debates forced him to reach conclusions not accepted by mainstream Islam. Thus he was attacked severely by the major Muslim thinkers as early as the fourth century AH (tenth century AD), including al-Kindi, al-Khayyat, Abu al-Hasan al-Ash'ari, Abu

‘Ali al-Jubba’i and al-Farabi.

In most of his later works, Ibn ar-Rawandi advocated rejection of religious doctrines, which he considered unacceptable to reason. Thus, he attacked the prophets and certain traditional interpretations and concepts of the Qur’an. Among his teachings were the ideas that prophets make the same kind of claims that magicians make, and that the world is eternal and its events do not prove that they have a first cause. The Qur’an, in his view, is not the eternal word of God, nor is its language miraculous; some human beings, such as al-Aktham ibn Saifi, made better statements than some of those found in the Qur’an. God was without knowledge until he created his knowledge: God is like an angry enemy who can remedy things only by imposing punishment on others and who is capable of wrongdoing. Since he can do these things directly, he needs no holy book and no prophet. However, a God who treats his creatures in this way is not wise. His lack of wisdom is also revealed in his requiring his creatures to obey him when he knows that they will not do so, and in placing them in hell for eternity if they disobey him. Heaven, as described in the Qur’an, has nothing desirable.

Ibn ar-Rawandi had a gloomy outlook on life. This is best expressed in some of his verses where he says: ‘The calamities of life are numerous and continuous. Its joy, on the other hand, comes to you as do holidays.’

al-‘Abbasi (before 1556) *Ma‘ahid at-tansis (Known Citations)*, ed. M. ‘Abd al-Hamid, Cairo: Matba‘at as-Sa‘ada, 1947.(Includes a brief account of Ibn ar-Rawandi’s life, works and poetry.)

al-A‘sam, A. (1975) *History of Ibn Ar-Riwandi the Heretic*, Beirut: Dar al-Afaq al-Jadida.(A collection of the most important medieval Islamic sources, including those of Ibn al-Jawzi and al-Mu’ayyad fi ad-Din, that mention Ibn ar-Rawandi. It shows that the majority of Muslim thinkers in the Middle Ages rejected his views and tried to distance themselves from him.)

al-A‘sam, A. (1978-9) *Ibn ar-Riwandi fi al-maraji‘ al-‘arabiyya al-haditha (Ibn ar-Rawandi in Modern Arabic Sources)*, Beirut: Dar al-Afaq al-Jadida.(Another collection of Islamic sources, dating from the fourteenth century to the present. It reveals that Muslim thinkers continued to consider Ibn ar-Rawandi a heretic. Like the above work of al-A‘sam, it is helpful in presenting the most important views about Ibn ar-Rawandi, as they circulated in chronological order.)

al-Mu’ayyad fi al-Din (before 979) *al-Majalis al-mu’ayyadiyya lil-Mu’ayyad fi ad-Din ash-Shirazi (The Mu’ayyadiyya Councils by al-Mu’ayyad fi ad-Din of Shiraz)*, ed. M.A.Q. ‘Abd al-Nasir, Cairo: Dar ath-Thaqafa, 1975.(Includes parts of the *az-Zumurrud* of Ibn ar-Rawandi.)

Ibn al-Jawzi (before 1201) *al-Muntazam fi tarikh al-muluk wal-umam (Organization in the History of Kings and Nations)*, ed. M.A.Q. ‘Ata and M.A.Q. ‘Ata, Beirut: Dar al-Kutub al-‘Ilmiyya, 1992.(Includes portions of the *ad-Damigh* of Ibn ar-Rawandi.)

Stroumsa, S. (1985) ‘The Barahima in Early Kalam’, *Jerusalem Studies in Arabic and Islam* 6: 229-41.(Offers a non-traditional interpretation of Ibn ar-Rawandi’s thought, which helps in drawing attention to his early views that are usually neglected by the majority of Islamic sources.)

Ibn Bajja, Abu Bakr Muhammad ibn Yahya ibn as-Say'igh (d. 1138)

Ibn Bajja's philosophy may be summed up in two words; al-ittisal *(conjunction) and* al-tawahhud *(solitude). Conjunction is union with the divine realm, a union that reveals the eternal and innermost aspects of the universe. Through this union or knowledge, one is completed as a human being, and in this completion the ultimate human end, happiness, is achieved. Solitude, on the other hand, is separation from a society that is lacking in knowledge. Once united with the eternal aspects of the universe, one must isolate oneself from those who are not in the same state, who may therefore distract one from the supernatural realm through their ignorance and corruption.*

1 Life and works

Abu Bakr Muhammad ibn Yahya ibn as-Say'igh, known as Ibn Bajja (or Avempace in the West), was born in Saragossa, Spain, at an unknown date and died in Fez in North Africa in AH 537/AD 1138. In *Akhbar al-hukama' (Information About Wise People)*, al-Qifti mentions that Ibn Bajja died from being poisoned by rivals in the field of medicine. He was the teacher of Ibn al-Imam and Ibn Rushd (Averroes). His prominence was the result of his being the first in the West to show deep understanding of the views of some of his predecessors, such as Plato, Aristotle, al-Farabi, Ibn Sina (though Ibn Bajja never directly mentions him) and al-Ghazali. Thus he served as a link between the East and the West.

Ibn al-Imam edited his teacher's works in AH 534/AD 1135. They include medical works, commentaries on Aristotle and al-Farabi and original philosophical treatises. The most important of these treatises are *Tadbir al-mutawahhid (Management of the Solitary)*, *Risalat al-wada' (Essay on Bidding Farewell)* and *Risalat al-ittisal al-'aql al fa''al bil-insan (Essay on the Conjunction of the Intellect with Human Beings)*.

In spite of the criticism directed against Ibn Bajja by some of his contemporaries, such as Ibn Tufayl, he was highly regarded even by those critics themselves. Ibn Tufayl described him as possessing 'the sharpest mind', 'the soundest reasoning' and 'the most valid opinion' of those following the first generation of thinkers. The reference here is to the Arab/Spanish thinkers who lived from the earlier part of the second half of the tenth century to the end of the eleventh century, which marks the emergence of the second generation of Arab/Spanish thinkers. The first generation is characterized by interest in learning about ancient logic and philosophy; the second, beginning with Ibn Bajja, is characterized by originality of philosophical writings. His student Ibn al-Imam describes him as the marvel of his time in depth of philosophical knowledge.

2 The human soul

The two most essential pillars on which Ibn Bajja's philosophy rests are *al-ittisal* (conjunction) and *al-tawahhud* (solitude or union). *Al-ittisal* is that of the philosopher with the agent intellect (the lowest celestial intelligence and home to the universals), and *al-tawahhud*, when used in the sense of solitude, is that of the philosopher in society. *Al-tawahhud* is also used in the sense of *al-ittisal* (union). Like his Eastern predecessors, al-Farabi and Ibn Sina, Ibn Bajja was most concerned with the ultimate human objective, the intellectual or philosophical ideal, which in turn is in conjunction with the agent intellect through grasping the universals (see Universals). This conjunction results in self-completion, which is the same as happiness. To understand the ultimate human objective and the instruments through which it is attained, Ibn Bajja first traces the development of the human soul, the only means to conjunction.

The human soul, he believes, develops from the plant to the animal and finally to the rational life. The plant life is the embryonic life, which provides one with nourishment and growth. With the progress from the plant to the animal life, which is the sensitive life, one moves from mere vegetation to sensation, movement and desire. Sensation is acquired either by the five external senses or by the internal senses, the common sense, the imagination and memory. By acquiring thought, or the highest human state, one rises to the level of rational speculation. While the human soul incorporates these three states, human nature or essence as such is described as *'aql* (reason or intellect). In the tradition of al-Farabi and Ibn Sina, Ibn Bajja teaches that the intellect is either potential or actual. When it is potential, it has the capacity for acquiring its proper object, the intelligible form (*as-sura al-'aqliyya*) or, as Ibn Bajja is fond of calling it, the spiritual form (*as-sura ar-ruhaniyya*), the form that belongs to the soul. When it is actual, it is identified with its object (see Soul in Islamic philosophy).

3 Intelligible forms

Four types of intelligible forms in themselves are distinguished: those of the bodies that have an eternal circular motion; those of the agent and acquired intellects (the acquired intellect being the highest level of the human intellect, which results from conjunction with the agent intellect); those of the material world, which are stripped by the external senses from external particular things; and those in the internal senses. The first are in all respects immaterial, that is, lacking any necessary relation to matter. The second are in themselves immaterial; they have only an inessential relation to matter, the agent intellect by virtue of causing the material forms and the acquired intellect by virtue of completing them. The third are essentially linked to matter; they exist in matter and are made intelligible only through the mediation of the external senses. The fourth lie between the second and the third and are therefore in part material and in part not. Since, to Ibn Bajja, immateriality necessitates universality and materiality necessitates particularity, the following conclusion is drawn: the first, second and, in part, fourth types of intelligible forms are universal, while the third and, in part, fourth are particular.

Along Greek and Islamic lines, Ibn Bajja insists that the completion of every nature is the best for that nature and its highest objective. However, the completion of a nature requires that nature to acquire its proper objects. Since the nature of being human is reason, and since the proper objects of reason are the separate forms or universals which reside in the agent intellect, to acquire these objects is to complete human nature. A human being grasps the purely material forms through the external senses and benefits from them, and grasps the forms that are somewhat purified from matter through the internal senses and also benefits from them. Grasping the separate forms through reason is, however, the most befitting to human nature, and hence is best for it. On the basis of the kind of power one uses to grasp the intelligibles, Ibn Bajja divides people into three groups: the multitudes, the theorists and the philosophers. The multitudes grasp the intelligibles with the external senses, the theorists grasp them with the internal senses and the philosophers grasp them with reason. Only the philosophers can be classified as happy, for they acquire the universals in themselves, the objects of reason.

In *al-Ittisal*, Ibn Bajja states that it is as if the multitudes grasp the sun as reflected in the mirror after its having been reflected in water. The theorists grasp it as reflected in water; the philosophers grasp it in itself. He compares the multitudes to people in a cave in which the sun never shines. If they are in the very inside of the cave, objects appear to them in a state of darkness; if instead they are at the entrance of the cave, objects appear to them in the shade. As the people of the cave, regardless of their place, have no idea of what it means to see the sun, so also the multitudes have no idea of what it means to grasp the intelligibles rationally. He compares the theorists, on the other hand, to those who have gone out of the cave, where they can see the sun shedding its light on things and making the colours of things visible in themselves. He does not believe, however, that the happy ones can be compared to any beings with physical vision 'since they and the thing they grasp become one'. Being in the happy state is like having vision itself transformed into light. In other words, the multitudes grasp the reflection of the reflection of a thing, the theorists grasp the reflection of a thing and the philosophers grasp the thing itself.

4 The state of conjunction

To be a philosopher, or to have conjunction with the universals in the agent intellect, is to have ultimate human happiness and to experience 'witnessing' of the truth. The happy ones are incorruptible, eternal and 'numerically one with no difference among them in themselves whatsoever'. Their instruments, or their bodies, are the only things that differentiate them from each other. They are incorruptible and eternal because the intelligibles with which they are identified are so, and are numerically one because they are all identified with the same intelligibles.

Ibn Bajja rejects the Sufi concept that the ultimate human end is the pleasure (*al-ladhdha*) which results from witnessing (*mushahadat*) the divine world internally, in a higher sensible form as presented by the common sense, imagination and memory. According to him, this amounts to saying that 'having pleasure internally is the ultimate objective of knowing the Truth through the internal senses'. However, this is not the case since this pleasure is not sought for its own sake. In support of his view, Ibn Bajja mentions among other things that if pleasure of the internal senses were the ultimate human end, then reason (which is a higher power than the internal senses) as well as its knowledge would be superfluous and futile.

Because knowledge of the internal senses is higher than that of the external senses, the objects of the former being

more enduring than those of the latter, the pleasure of the internal senses is higher than that of the external senses. The assertion that the former objects are more enduring than the latter is demonstrated by the fact that one can imagine the existence of something that has ceased to exist externally. However, even knowledge of the internal senses still falls short of reaching the sublimity of the knowledge of reason since the objects of the former do not endure as much as those of the latter. Only the objects of the latter endure permanently, unaffected by the forgetfulness or even the removal of their subject. Knowledge of these permanent objects gives the knower a permanent status since the knower and the known in this case are one. It also gives the highest and most permanent pleasure. The state of happiness is one which cannot be described in language, owing to its nobility, pleasure, beauty and goodness. When human beings reach this ultimate end, they become simple intellects of which it is true to say that they are nothing but divine.

5 Solitude

The knower, or happy person, may exist in society in either a virtuous or a nonvirtuous city. A virtuous city is one whose members are all complete in knowledge, while in a nonvirtuous city the contrary is the case.

If perfected people exist in a nonvirtuous city, they must live in isolation from the rest of society, for their complete knowledge makes them 'strangers' or 'weeds', that is, those whose true opinions are contrary to the opinions of society. While isolation from society is not natural or essential for a human being in the natural or virtuous city, it is accidental to one's nature and must be practised in order to preserve oneself from the corruption of the nonvirtuous cities.

Ibn Daud, Abraham (*c*.1110-*c*.1180)

Ibn Daud was born in Cordoba and died in Toledo. In Jewish texts he is known as Rabad, an acronym of his Hebrew name, Rabbi Abraham ben David. He was known to medieval Christian philosophers by a variety of names, including Avendauth and possibly John of Spain as well. His Sefer ha-Kabbalah (The Book of Tradition), regarded by some scholars as the first comprehensive study of Jewish history, is an extended argument for the authority of rabbinic Judaism on the grounds that it is an unbroken tradition of authentic sources, from the Mosaic origins through the first two Jewish commonwealths, the exile, and down to the author's time. His major work in philosophy is Al-'Aqida al-Rafi'a (The Exalted Faith), composed in 1160 in Judaeo-Arabic, the form of Arabic written in Hebrew characters that was commonly used by Jewish scholars and thinkers in the Muslim milieu. It survives only in two late fourteenth-century Hebrew translations, one by Samuel Motot, entitled Ha-Emunah ha-Nissa'ah, and the other, better known, by Solomon ibn Labi, entitled Ha-Emunah ha-Ramah.

1 Aristotelianism

Abraham ibn Daud was the first philosopher to apply the diverse elements of Aristotelian philosophy to forge a philosophy of Judaism. He initiated a new direction in Jewish philosophy that continued in the writings of Maimonides (1135-1204) and culminated in the philosophy of Gersonides (1288-1344). The relationship of these Jewish Aristotelians might be compared to that of Locke, Berkeley and Hume in British philosophy. If Ibn Daud is not always as rigorous as Maimonides or Gersonides, it is because they build on the foundations he laid down. But no Jewish Aristotelian's work is as comprehensive as Ibn Daud's, and on many topics his treatment is more thorough or philosophically more sophisticated than that of Maimonides. For example, the concept of the soul and its faculties is of central importance to Maimonides in the *Dalalat al-Ha'irin (Moreh Nevukhim, Guide to the Perplexed)*. Yet he presents no clear theory of the soul in the *Dalalat al-Ha'irin (Moreh Nevukhim, Guide to the Perplexed)*; and, where he does deal with psychology at length, as in *Shemonah Perakim (Eight Chapters)*, many of his assertions become clear only with the aid of Ibn Daud's discussions in *Ha-Emunah ha-Ramah*. For instance, Maimonides states that while souls have multiple powers there are not multiple souls in each individual; and a particular faculty in one species is not the same as the corresponding faculty in another, even though the faculties bear the same name. Thus, both animals and humans exercise nutritive functions and have nutritive 'souls', but the term names a faculty, not a separate being; and the nutritive function in animals is not the same as that of humans. Ibn Daud develops and defends these views at length; Maimonides merely asserts them.

2 *Ha-Emunah ha-Ramah*

Ha-Emunah ha-Ramah comprises three books. The first explains the presuppositions of Aristotelianism. The intended audience consists of those cultured Jews who know of, but little about, the new Aristotelian science. In the Western lands of Muslim civilization that science was now displacing the older atomism of the *kalam* (see Islamic theology). In the second book Ibn Daud lists six basic principles of Judaism and explains them in the light of the new science. In the third book he applies to ethics the presuppositions and principles he has laid out.

The status of the third book, entitled *Barefuah ha-Nafshiyah (The Healing of the Soul)*, within the whole is problematic. Ibn Daud tells us that his goal in composing the entire work was to solve the problem of human choice and determinism. That question was dealt with directly in the final chapter of the second book. Given his stated intention, this is where *Ha-Emunah ha-Ramah* should end. Everything that goes before can be seen as material arrayed in support of this final discussion; but the internal structure of all the material presented in every known manuscript of the third book is incoherent. For example, it is supposed to comprise two chapters, but all the existing manuscripts contain only a first chapter that deals with a potpourri of issues in ethics. At best Book Three is an addendum, and one that has an unfinished look compared to the organized state of what went before. For these reasons the following summary is limited to the first two books.

Book One contains eight chapters. The first three define key technical terms in the new Aristotelian science: substance, accident, and the ten categories (ch. 1), form and matter (ch. 2), and motion (ch. 3). There follow two chapters on physics. Here Ibn Daud spells out the theses that material bodies possess neither actual nor potential infinity (ch. 4) and that all motion comes from a mover and requires a first mover (ch. 5). In two chapters on rational psychology he describes the nature and powers of the soul (ch. 6) and defends the claim that the rational

power is nonphysical (ch. 7). The last chapter deals with astronomy. Here Ibn Daud argues for the claim, critical to his solution of the problem of determinism, that the heavens are rational, living organisms, their motion intentional.

Book Two uses the ideas of the first book to explain what Ibn Daud deems to be the basic principles of the Jewish faith and religious law (see Halakhah). The first four principles address the existence and nature of God. The fifth defends the authority of the rabbinic tradition. The sixth turns to the target Ibn Daud specified in his introductory abstract, the problem of human choice.

The first two principles are that God is a necessary being and that he is one. Only a necessary being can be truly one (ch. 1). God's unity is essential, not accidental and admits no plurality of any kind (ch. 2). Ibn Daud's third principle is that all affirmative characterizations of God, even the ascription to him of unity and necessity, are equivocal, bearing different senses from those of ordinary usage. As applied to God, they express either a negation or a relation. Like Maimonides, then, Ibn Daud espouses a negative theology (see Negative theology). But his acceptance of relational statements about God saves him from the kind of attack that Maimonides' theology later received from such Aristotelians as Thomas Aquinas and Gersonides.

Ibn Daud's fourth principle explains divine actions in terms of the mediation of the beings that Scripture calls angels. Ibn Daud identifies them with the separate intellects of Aristotelian cosmology. He devotes two chapters to proofs of their existence. The first argues from epistemology and the powers of the soul. The second is based on physics and astronomy. A third chapter surveys the entities in the universe and the kinds of angels/separate intellects who govern them on behalf of God.

The fifth principle is that the Hebrew Scriptures as interpreted by the rabbis (not the Karaites, Muslims or Christians) are an authoritative source of truth. An introductory abstract defends the general thesis that authentic traditions can make veridical claims. The next two chapters argue that rabbinic Judaism is such a tradition. The first of these deals with the nature of the prophecy recorded in Scripture and categorizes its degrees, laying a foundation for the argument that the prophecy of Moses, as recorded in the Torah, is an unimpeachable witness to the word of God. The second argues that the transmission of Moses' report through the early and later rabbinic sages was faithful to his original testimony. Thus statements in the rabbinic tradition preserve the same epistemic status as direct reports of sense experience or reliable traditions of such reports. This chapter recaps the more extended argument of Ibn Daud's earlier work on the continuity of Jewish ideas, *Sefer ha-Kabbalah (The Book of Tradition)*.

The final principle is that human choice is not obviated by divine or natural necessity. The problem as Ibn Daud states it: if God rules over all things, no human being would have any choices. But that cannot be. For God issues commands and punishes disobedience, and no one can be justly punished for acts that were not free. Nor can one be commanded to do where one has no choice. So God's rule does not exclude human choice. But how can there be anything over which God does not have dominion? Scripture only exacerbates the dilemma. For some texts seem to say that God determines everything, while others imply that we do have choices.

Ibn Daud devotes two chapters to the problem. The first grounds his solution in his earlier discussion of God's attributes. Since all terms predicated of God are equivocal, no statements about divine power and rule can be understood literally. The second chapter presents Ibn Daud's answer. Everything is determined by God through his ordering of the universe, but this ordering allows us to make choices. So people are morally responsible and are subject to divine providence, punishment and reward.

Ibn Daud does not list creation as a fundamental principle of Judaism, although his predecessor, Saadiah Gaon al-Fayyumi (882-942), made it the cornerstone of Jewish belief. Perhaps Ibn Daud omitted creation because it was the one central belief in Judaism that could not be explained or defended from the standpoint of the new Aristotelianism. The conflict between Aristotelian eternalism and biblical creationism was to become a central theme in the philosophies of Maimonides and Gersonides.

3 Influence

Beyond their intrinsic worth and interest as contributions to philosophy, Ibn Daud's ideas had a powerful impact on later Jewish thought. While everything he said was rooted in rabbinic tradition, his formulations, applications

and syntheses were highly original and presaged the issues that were to dominate the history of Jewish Aristotelianism. A key example is his understanding of the relationship between religion and science. For Ibn Daud and his Jewish Aristotelian successors, there is no conflict between religious and scientific truth. Truth is one. Religion no less than science makes truth claims; and these claims, if true, must cohere with those of science. Furthermore, since Jewish faith cannot be confined to one part of one's life, no understanding of Judaism that excludes the insights of science can be 'Torah true'. This challenging model of the relationship between science and religion allowed Ibn Daud to incorporate the new Aristotelian science into the outlook of rabbinic Judaism and set the agenda for later Jewish philosophers from Maimonides through Gersonides. The synthesis he inaugurated survived until its eventual overthrow by Hasdai Crescas (1340-1412) and Benedict de Spinoza (1634-77), when Aristotelianism was itself surpassed.

Ibn Ezra, Abraham (1089-1164)

The philosophy of Ibn Ezra attained broad influence in Jewish literature through his Bible commentaries, included to this day in rabbinic Bibles. Born in Tudela, Spain, he was forced in later life (1140 until his death) to wander widely, at length settling in Rome and Lucca, where he composed some of his greatest works. A friend and, by some traditions, son-in-law of the poet-philosopher Judah Halevi, whom he mentions occasionally, he was himself a poet and wrote prolifically on grammar, exegesis, philosophy, medicine, astronomy and astrology. The many editions and manuscripts of his works attest their popularity, and some, especially on astronomy and astrology, were translated into Latin and then into French, Spanish, English and German.

Neoplatonic in orientation, with a Neo-Pythagorean fascination with numerology, Abraham ben Meir ibn Ezra's philosophy is often difficult to follow, since most of his works are unsystematic in exposition and elliptical in style. Frequently he engages in technical issues of grammar or literary analysis. His commentaries sometimes note 'this is a mystery (*sod*)' or 'the intelligent (*maskil*) should keep silent'. Such comments can signal the profundity of an issue, but at times Ibn Ezra seems deliberately to mute his radical conclusions.

Reason (*sekhel*) for Ibn Ezra is at the core of revelation, which is not just a historical event but a rational process. A proper understanding of Scripture thus demands a rational exegetical method grounded in Hebrew grammar and seeking the plain sense (*peshat*) of the text, not subordinate to homiletics or allegories. Yet revelation cannot contradict reason. So when a literal interpretation contradicts our rational or empirical knowledge, we must read nonliterally. Ibn Ezra generally upholds rabbinic tradition, but he is critical of rabbinic homiletical liberties (for example, in reconciling the variant wordings of the Decalogue in Exodus 20 and Deuteronomy 5) and of Karaite literalism (regarding the *lex talionis* in Exodus 21, for instance). Of both he says, 'reason cannot tolerate (*ein ha-da'at sovelet*)' such views. For 'reason is implanted in the heart by divine wisdom…. The judgement of reason is the foundation, and the Torah was not given to those who lack reason. The angel between man and his God is his reason'.

Spinoza, who founded modern critical readings of Scripture, saw Ibn Ezra as his forerunner in the belief that 'it was not Moses who wrote the Pentateuch, but someone who lived long after him'. 'Aben Ezra,' he writes (1670), '…a man of enlightened intelligence, and no small learning, who was the first, so far as I know, to treat of this opinion, dared not express his meaning openly, but confined himself to dark hints' (1670: ch. 8).

Ibn Ezra does question such passages as Genesis 12: 6, 22: 14, 36: 31-6, Exodus 6: 28, Numbers 21: 1-3, Deuteronomy 1: 2, and 34: 1-12, but his conclusion is not Spinoza's. Faithful to rabbinic tradition, he affirms as revealed the authority of the later prophets, the 'Oral Torah' of the rabbis and even the textual work of the medieval Masoretes (see Halakhah). Occasional interpolations do not undermine the authority of revelation but prove it, since revelation must make sense, and it would be absurd to ascribe, say to Moses, statements he could not meaningfully have made.

Ibn Ezra's interest in astrology was shared by some Jewish philosophers like Abraham Bar Hayya and Levi Ben Gershom (see Gersonides) but vigorously opposed by others such as Maimonides. For Ibn Ezra astrology can explain terrestrial phenomena and, so, some biblical phenomena scientifically (see Commentaries on Genesis 31: 19, 1 Samuel 19: 13, and Numbers 21: 8). Thus, unlike Maimonides, Ibn Ezra draws no sharp line between scientific astronomy and judicial astrology.

His Neoplatonic assumption that the terrestial realm is subject to influences from the incorruptible celestial spheres, which in turn are governed from the supernal realm of the rational soul (*neshamah*) and the angels, all under the sovereignty of God, the 'absolute One' (see Commentary on Exodus 3: 15, and 6: 3), prompts Ibn Ezra to seek astral explanations of terrestial, especially human, affairs. But he stoutly rejects star worship. The celestial bodies are 'servants' (*mershartim*), without independent will or conscious purpose; their activity is mechanical (see Commentary on Exodus 33: 21, citing the Epistles of the Sincere Brethren of Basra) (see Ikhwan al-Safa').

Ibn Ezra mitigates the determinism of astrology by arguing that astral influence is not merely a function of the celestial configuration (*ma'arekhet*) but also of the physical consititution (*toledet*) of the recipient (*meqabbel*) of influence (Introduction to Ecclesiastes). This explains why one astral agent can produce diverse terrestrial effects.

It also leaves room for free will. Indeed, it is the predictability of astral effects that enables one to take measures to avoid their impact. The event will occur, but those who understand can escape its effect. Reason, after all, transcends the intermediate realm of the stars.

The Torah, deriving from the supernal rational realm, affords a systematic avenue of escape from astral determinations to those Jews who observe it. Building on the Talmudic dictum ‘Israel has no constellar sign (*mazal*)’, Ibn Ezra reasons: ‘it is well established that every nation has a known star or constellation. But God gave Israel a great superiority, since He rather than a star is their guide - for "Israel is God’s portion"’ (Commentary on Deuteronomy 4: 19). The Torah imparts knowledge to its adherents, enabling them to escape astral influences. They do so naturalistically, not theurgically.

For Ibn Ezra revelation and reason are ultimately perfectly congruent. His critical reading of the biblical text and his astrological interpretations of some biblical passages arise from his consistent application of a naturalistic and rationalistic exegetical method and express his commitment to the view that rationality is inherent in revelation itself.

Ibn Ezra, Moses ben Jacob (*fl.* 1055-1135)

Ibn Ezra was an exegete, Jewish scholar and one of the foremost Hebrew poets of medieval Spain. Although none of his systematic biblical commentaries have been preserved, two important works survive in Judaeo-Arabic prose, both dealing with biblical literary theory, rhetoric and philosophy. The literary dimension of his work makes Ibn Ezra a forerunner of modern biblical criticism. His speculative system, deeply influenced by Neplatonism, was to have a profound impact on the early Spanish Kabbalists.

Born in Granada into a family of government officials, Ibn Ezra was a disciple of the famous Talmudist Isaac ibn Ghiyath (1038-88) at Lucena, where he received a thorough Hebrew and Arabic education. In his youth, Ibn Ezra befriended the foremost literati of his time, especially the poet and philosopher Judah Halevi, whose creative talent he encouraged. During the Almoravid invasion of Granada in 1090 he fled to Christain Spain, where he led a life of exile, constantly pining for his native Andalusia, which he never regained. Ibn Ezra is rightly considered one of the greatest Hebrew poets of the Andalusian Golden Age. His Arabic prose works, containing his views on literary history, theory and criticism, rhetorics and philosophy are not as well known. Yet his *Kitab al-muhadara wal-mudakara (Book of Conversation and Discussion)* and his *Maqalat al-hadiqa fî ma'na l-magaz wal-haqiqa (The Treatise of Garden on Metaphorical and Literal Meaning)* rank amongst the classics of Judaeo-Arabic literature. The former is divided into eight chapters, containing a discussion of the nature of poetry and a treatise on Jewish literary history. The last and longest chapter examines the figures of thought and expression used to embellish Hebrew poetry. In addition to its didactic - and even polemical - content as a kind of Hebrew *ars poetica*, the book has recently been described as an attempt to provide biblical legitimation to the 'profane' Hebrew poetry of the Andalusian school. Its application of rhetoric to Scripture is an early step towards the modern literary criticism of the Hebrew Bible.

The *Maqalat al-hadiqa fî ma'na l-magaz wal-haqiqa (The Treatise of Garden on Metaphorical and Literal Meaning)*, although not a systematic philosophical treatise in the strict sense, contains much speculative material. Inititially conceived of as a disquisition on the biblical use of metaphorical language, the work is divided into two parts, the first of which proposes a variety of philosophical themes for the consideration of the reader. Suffused with anecdotes, poetic quotations, wise sayings and scientific observations, the work preserves important extracts of works now lost, such as the Arabic original of Ibn Gabirol's *Fons Vitae*. It adopts a genuinely humanistic perspective, expressed in part in its anthropocentrism. The book as a whole reflects both the influence of the Mu'tazilite school and the strong Neoplatonic current that entered Spain with the works of the Brethren of Purity (see Ash'ariyya and Mu'tazila; Ikhwan al-Safa'). The eleven chapters of the first part discuss the fundamental themes of Mu'tazilite theodicy, coloured with Neoplatonic insights: divine unity and unknowability, negative and apophatic theology, creation, revelation, nature, intellect and the human soul. Drawing on the Neoplatonic systems of Pseudo-Empedocles, Isaac Israeli, Dunash ben Tamim, Ibn Gabirol and, above all, the Brethren of Purity, Ibn Ezra adopts the doctrine of emanation and makes the 'active intellect' the first divine creation, an entity that by his account proceded from the divine Will. This intellect is a pure and simple substance containing the forms of all existents (see Neoplatonism). The author also adopts Ibn Gabirol's hylomorphism. On the Greco-Arabic side, besides the ancient authors, such as pseudo-Aristotle, Plato and Hippocrates, the most often quoted are the Brethren of Purity and al-Farabi, mentioned here for the first time in Jewish philosophy.

The second part takes the form of a glossary of terms designating humanity, viewed from physical and spiritual perspectives, and examines their literal and figurative use. Ibn Ezra's exegesis belongs to the Andalusian rationalistic tradition. The Hebrew version of the philosophical section of the book, translated in the Middle Ages by the celebrated poet and translator, Judah al-Harizi, was to have an abiding impact even among Kabbalists, who used it in the development of their speculative systems. It was an important link in the transmission of Neoplatonic elements to the early Spanish Kabbalah (see Kabbalah). However, the work is important more as a transmittor than as a fount of original thinking.

Ibn Falaquera, Shem Tov (1223/8-after 1290)

A prolific author with a clear and precise Hebrew style, Ibn Falaquera wrote both original works and Hebrew translations of Arabic works of philosophy and science. His writings include encyclopedias, Bible commentaries, the first commentary on Maimonides' *Guide to the Perplexed and, by his own account, some twenty thousand verses of poetry. Unlike Maimonides, who wrote for the intelligentsia, Ibn Falaquera wrote most of his works with the stated aim of raising the cultural level of the Jewish people. Most of his prose works survive, many in multiple editions or manuscripts and several in European translations, a testimony to their popularity. A consistent theme in his works is the harmony of faith and reason.*

Shem Tov ben Joseph ibn Falaquera was born in Spain between 1223 and 1228; his last known work refers to events in 1290. Various etymologies have been suggested for the name Falaquera, for which we have diverse spellings in Hebrew and European languages, and which was the name of a prominent Jewish family in Tudela. Most of his prose works survive, and many can be found in multiple editions or manuscripts. More than half of his youthful poetry was lost, he tells us, and in later life he abandoned his poetic career but continued to intersperse poetry, some of it humorous, with his prose works.

We know of eighteen works by Ibn Falaquera. In probable chronological order they are:

(1) *Batei Hanhagat Guf ha-Bari, Batei Hanhagat ha-Nefesh (Verses on the Regimen of the Healthy Body and Soul)*;
(2) *Iggeret ha-Musar (Epistle on Ethics)*, a *maqama* (prose narrative interspersed with verse) replete with with Jewish and Arabic ethical maxims, recounting the adventures of a youth in search of wisdom;
(3) *Zeri ha-Yagon (Balm for Sorrow)*, another *maqama*, containing rabbinic and philosophic consolations;
(4) *Megillat ha-Zikkaron (The Scroll of Remembrance)*, a lost work, presumably chronicling Jewish sufferings;
(5) *Iggeret ha-Vikuah (Epistle of the Debate)*, a debate between a pious traditionalist Jew and a philosopher, demonstrating that philosophy is the twin sister of Torah and fully harmonious with Judaism;
(6) *Reshit Hokhmah (The Beginning of Wisdom)*, an introduction to the sciences, including much material based on the works of al-Farabi;
(7) *Sefer ha-Ma'alot (Book of Degrees)*, an ethical work on the corporeal, spiritual and divine degrees of human perfection (*ma'alot* (degrees) is the Hebrew term for the virtues);
(8) *Sefer ha-Mevaqqesh (Book of the Seeker)*, composed in 1263, when Ibn Falaquera says he was past 35 and approaching 40, a *maqama* expanding on the theme of the youthful seeker after wisdom, surveying the arts, professions and sciences, culminating in philosophy;
(9) *De'ot ha-Philosofim (The Opinions of the Philosophers)*, a voluminous encyclopedia of the sciences intended to propagate philosophy among Jews and quoting extensively from the Arabic sources;
(10) *Sefer ha-Nefesh (Book of the Soul)*, the first systematic Hebrew work of psychology;
(11) *Shelemut ha-Ma'asim (The Perfection of Actions)*, based on the *Nicomachean Ethics* and Arabic ethical literature;
(12) *Iggeret ha-Halom (Treatise of the Dream)*, on physical and spiritual well-being;
(13) *Sefer ha-Derash (The Book of Interpretation)*, no longer extant, probably a commentary on *aggadic* passages in the Talmud and midrash;
(14) *Perush (Bible Commentary)*; only fragments (often philosophical in orientation) survive, in citations by later authors;
(15) *Moreh ha-Moreh (Guide to the Guide)*, completed in 1280, the first commentary on Maimonides' *Guide to the Perplexed*, including original Hebrew translations of the passages discussed, and comparing Maimonides (sometimes critically) to numerous classical, Arabic and Jewish philosophers;
(16) *Liqqutim mi-Sefer Meqor Hayyim*, selections from the *Fons Vitae* in Hebrew translation, eliminating the dialogue format of Ibn Gabirol's original (see Ibn Gabirol);
(17) *Liqqutim mi-Sefer ha-'Azamim ha-Hamishah (Selections from the Book of the Five Substances)*, Hebrew translation of passages from a Pseudo-Empedoclean work;
(18) *Mikhtav 'al Devar ha-Moreh (Letter on the Matter of the Guide)*, Ibn Falaquera's last known work, a defence of Maimonides' *Guide* against anti-philosophical critics.

A consistent theme in Ibn Falaquera’s works is the harmony of faith and reason. Philosophy and Torah, when both are properly understood, are ‘sisters’ and ‘twins’. The rabbinic saying, ‘Rabbi Meir found a pomegranate; he ate what was within and discarded the peel’ (Hagigah 15b), means that one must accept what is true and concordant with Torah in philosophy. Reason can verify religious truth, and faith perfects reason.

To reject philosophy because some philosophers have erred is like denying water to a person dying of thirst, just because some people have drowned. A Jew must learn the truth from any source, as one takes honey from a bee. For ‘all nations share in the sciences; they are not peculiar to one people’ (*Sefer ha-Ma‘alot*). Thus: ‘Accept the truth from whoever utters it; look at the content, not the speaker’ (*Sefer ha-Ma‘alot*). Since true human perfection is intellectual, dissemination of philosophy in Hebrew and rebuttal of its detractors serve a religious as well as a cultural need.

Ibn Falaquera’s rationalism is manifest throughout his works, including his Biblical exegesis and his specific theses. He equates his Platonizing doctrine of creation with the account of Genesis, and he reads his intellectualism into Biblical ethics to derive an extreme asceticism which does not stop short of misogyny: ethical and social commitments are ‘impediments’ to true, intellectual fulfillment. Ibn Falaquera combines his deep concern for the education of his people with the belief that genuine felicity is attained by the individual who is ‘solitary’ (*mitboded*), isolated not physically but spiritually from the external distractions of society and the internal promptings of the appetites. Knowledge of God begins with self-knowledge, knowledge of one’s own soul: ‘Know your soul, O man, and you will know your Creator’. Psychology is thus prior to all other sciences: ‘Knowledge of the soul is prior to the knowledge of God, and… is the most excellent form of knowledge after the knowledge of God’ (*Sefer ha-Nefesh*; *De‘ot ha-Philosofim* VI:A:1).

Ibn Falaquera was not an original thinker of the first order, but the breadth and depth of his knowledge of Judaism, philosophy and science make him an important figure in the history of Jewish philosophy. The pioneering philosophical efforts of earlier luminaries attained an enduring impact through their consolidation and popularization by philosophers like Ibn Falaquera, whose contribution is no less important for the fact that their light was often a reflected one.

RAPHAEL JOSPE

List of works

Most of Falaquera’s works exist in nineteenth or twentieth century Hebrew editions; some, accompanied by introductions or translations into European languages. See Jospe 1988: 485-97 for a more detailed bibliography.

Ibn Falaquera, Shem Tov (1223/8-after 1290) *Sefer ha-Ma‘alot (Book of Degrees)*, ed. L. Venetianer, Berlin, 1894; photo repr. in *Kitvei Rabbi Shem Tov Falaquera*, Jerusalem: Maqor, 1970.(An ethical work on the degrees of human perfection.)

Ibn Falaquera, Shem Tov (1223/8-after 1290) *Sefer ha-Nefesh (Book of the Soul)*, Warsaw, 1924; photo repr. in *Kitvei Rabbi Shem Tov Falaquera*, Jerusalem: Maqor, 1970; ed. and trans. R. Jospe in *Torah and Sophia: The Life and Thought of Shem Tov ibn Falaquera*, Cincinnati, OH: Hebrew Union College Press.(The first systematic Hebrew work on psychology.)

Ibn Falaquera, Shem Tov (1223/8-after 1290) *Shelemut ha-Ma‘asim (The Perfection of Actions)*, ed. R. Jospe in *Torah and Sophia: The Life and Thought of Shem Tov ibn Falaquera*, Cincinnati, OH: Hebrew Union College Press.(Ethical work based on the *Nicomachean Ethics* and Arabic ethical literature.)

Ibn Falaquera, Shem Tov (1223/8-after 1290) *Zeri ha-Yagon (Balm for Sorrow)*, trans. R.K. Barkan, ‘Shem Tob ben Joseph ibn Falaquera’s *Sori Yagon* or "Balm for Assuaging Grief", Its Literary Sources and Traditions’, Ph.D. thesis, Columbia University, 1971; repr. Ann Arbor, MI: University Microfilms, 1981.(A valuable study of the sources in classical and Arabic consolation literature.)

Ibn Falaquera, Shem Tov (1223/8-after 1290) *Iggeret ha-Vikuah (Epistle of the Debate)*, ed. A. Jellinek, Vienna, 1875; photo repr. in *Kitvei Rabbi Shem Tov Falaquera*, Jerusalem: Maqor, 1970; ed. G. Dahan, ‘Epistola Dialogi: Une Traduction Latine de L’*Igeret Ha-Vikuah* de Shemtov ibn Falaquera. Étude et Edition’, *Sefarad* 39 (1979): 1-112; trans. S. Harvey, *Falaquera’s Epistle of the Debate: An Introduction to Jewish Philosophy*, Cambridge, MA: Harvard University Press, 1987.(Dahan is a study of the Latin version of this popular work. Harvey is a clear annotated English translation with valuable appendices.)

Ibn Falaquera, Shem Tov (1223/8-after 1290) *Reshit Hokhmah (The Beginning of Wisdom)*, ed. M. David,

Berlin, 1902; photo repr. in *Kitvei Rabbi Shem Tov Falaquera*, Jerusalem: Maqor, 1970; trans. I. Efros in ‘Palquera’s *Reshit Hokmah* and Alfarabi’s *Ihsa al‘Ulum*’, *Jewish Quarterly Review*, new series 25, 1934-5: 227-35.(An important annotated translation of this major work, citing Arabic sources.)

Ibn Falaquera, Shem Tov (1223/8-after 1290) *Perush (Bible Commentary)*, fragments trans. R. Jospe and D. Schwartz, ‘Shem Tov ibn Falaquera’s *Lost Bible Commentary*’, *Hebrew Union College Annual* 64, 1993: 167-200.(New manuscript material with English translation and notes.)

Ibn Falaquera, Shem Tov (1223/8-after 1290) *Iggeret ha-Halom (Treatise of the Dream)*, ed. H. Malter, ‘Shem Tob ben Joseph Palquera: His Treatise of the Dream’, *Jewish Quarterly Review*, new series 1, 1910-11: 451-501; photo repr. in *Kitvei Rabbi Shem Tov Falaquera*, Jerusalem: Maqor, 1970.(A useful edition of this work.)

Ibn Falaquera, Shem Tov (1223/8-after 1290) *De‘ot ha-Philosofim (The Opinions of the Philosophers)*, introduction ed. M. Zonta, ‘Un Dizionario Filosofico Ebraico del XIII Secolo: L’introduzione al ‘Sefer De‘ot ha-Filosofim’ di Shem Tob ibn Falaquera’, Turin: Silvio Zamorani Editore, 1992.(A carefully annotated presentation of the Introduction to Falaquera’s unpublished philosophic encyclopedia.)

Ibn Falaquera, Shem Tov (1263) *Sefer ha-Mevaqqesh (Book of the Seeker)*, ed. M. Tamah, The Hague, 1778; photo repr. in *Kitvei Rabbi Shem Tov Falaquera*, Jerusalem: Maqor, 1970; trans. M.H. Levine, *Falaquera’s Book of the Seeker*, New York: Yeshiva University Press, 1976.(English translation, revised from the author’s 1954 Columbia University Ph.D. thesis, which is still worth consulting in its own right (published Ann Arbor, MI: University Microfilms, 1971).)

Ibn Falaquera, Shem Tov (1280) *Moreh ha-Moreh (Guide to the Guide)*, ed. Mordecai Leib Bisliches, Pressburg, 1837; photo repr. in *Sheloshah Qadmonei Mefarshei ha-Moreh*, Jerusalem, 1961; ed. Y. Shiffman, ‘Rabbi Shem Tov ben Joseph Falaquera’s *More ha-More*: A Philosophical and Philological Analysis’, unpublished Ph.D. thesis, Hebrew University of Jerusalem, 1990.(Shiffman is the definitive, annotated critical edition of Ibn Falaquera’s Commentary on Maimonides’ *Guide to the Perplexed*, focusing on his Arabic sources.)

Ibn Gabirol, Solomon (1021/2-57/8)

Ibn Gabirol was an outstanding exemplar of the Judaeo-Arabic symbiosis of medieval Muslim Spain, a poet as well as the author of prose works in both Hebrew and Arabic. His philosophical masterwork, the Mekor Hayyim (Fountain of Life), was well known to the Latin scholastics in its twelfth century Latin translation, the Fons Vitae. The work presents a Neoplatonic conception of reality, with a creator God at the apex. The universal hylomorphism that pervades the created order, both spiritual and corporeal, has divine will as the intermediary between God and creation, allowing Ibn Gabirol to avoid the rigidly determinist emanationism of his Greek predecessors. The Fons Vitae challenged such philosophers as Thomas Aquinas and Duns Scotus to critical reflections regarding individuation and personal immortality.

1 Life and writings

Solomon ben Judah Ibn Gabirol was born in Malaga, Spain, and reared in Saragossa. He spent his brief life under the enlightened reign of the Umayyad caliphate in Saragossa, Granada and finally Valencia, where he died between 1054 and 1070, most likely in 1057/8. Within a century of his death less tolerant regimes would hold sway, but for the moment Jews took an active part in the heady intellectual and literary life of Andalusia. Ibn Gabirol's poetry addresses both religious and secular themes. His *Keter Malkhut (Kingly Crown)* is a paean to God and creation. Its vivid expression of the poet's philosophical cosmology continues in use in some traditions of Jewish liturgy. Two philosophical prose works survive, both written originally in Arabic: the *Mekor Hayyim (Fountain of Life)*, translated into Latin as *Fons Vitae*, and the *Tikkun Middot ha-Nefesh (On the Improvement of Moral Qualities)*. The latter, written in 1045, survives in a fourteenth century Judaeo-Arabic manuscript; the former is represented in its original form only fragmentarily, but the twelfth-century Latin version is extant and was influential in Christian circles.

2 Philosophical thought

Ibn Gabirol's Neoplatonism is influenced by the *Liber de causis*, a ninth-century Arabic composition based on Proclus' *Elements of Theology* (see Liber de causis). More proximately, his work is influenced by the writings of Isaac Israeli and the pseudo-Empedoclean *Book of the Five Substances*. His philosophical poetry is expressive of Neoplatonic themes such as the soul/body dualism that undergirds what might be called Ibn Gabirol's rational mysticism: corporeal existence is devalued, in so far as it is deemed to block the path to knowledge and true felicity.

The *Tikkun Middot ha-Nefesh* comprises five parts, each of four chapters. It traces the development of some twenty moral traits to roots in specific physical senses. Pride and humility are assigned to sight; love and hate, to hearing; joy and sorrow, to taste; anger and jealousy, to smell; liberality and niggardliness, to touch. The connections are hardly perspicuous, and Ibn Gabirol does not explain them thoroughly except by introducing biblical passages suggestive of his theme. Yet it is clear that for him the body as well as the soul plays a role in the formation of virtue and thus in the attainment of happiness, which depends on achieving the proper balance among the bodily humours.

Ibn Gabirol's interest in the duality of body and soul is equally marked in the *Mekor Hayyim*, with its central polarity of matter and form. Written as a dialogue between master and pupil, the five books or treatises of the work propose a Neoplatonic cosmology and ontology along with a complementary epistemology that makes knowledge of the external world (and thus natural science) not merely dependent on self-knowledge but in fact a recapitulation of our self-awareness. As in Plotinus (*Enneads* 1.6: 8-9), the macrocosm is contained within the microcosm.

Ibn Gabirol's ontology is triadic: God, the divine will and the hylomorphic substances are its prime components. All created substances, whether spiritual or corporeal, are conjuncts of matter and form. Spiritual substances are individuated by intelligible matter; and corporeal substances, by virtue of their place in the hierarchy of being, are composed of a plurality of forms. Both doctrines, that of intelligible matter and that of the plurality of forms, occasioned controversy among the Christian scholastics. Intelligible matter, upheld by some to account for the individuation of incorporeal entities and to differentiate such entities from God, seemed to others an incoherent

notion that collapsed the very duality upon which Neoplatonic metaphysics is based. The plurality of forms, required by the emanationist programme and intended to account for the essence of corporeal entities, seemed to endanger the *unity* of the individual. A question arose whether living beings are composed of one soul or many; and if the latter, as Ibn Gabirol held, it was asked, how can such a composite being can be a unitary entity?

Just as the Greek Neoplatonists link the One to nature via Mind (see Neoplatonism), Ibn Gabirol links God to the world through a series of emanations, via the divine will. The relation of this will to God, the so-called first essence, remains somewhat problematic. For this will is the creative power of God, and as such is *in* God and inseparable from his being; yet it is also the first emanation from God and so would seem to be not an attribute but a separate hypostasis. In either case, however, the divine will is the cause of all created substances, both spiritual and corporeal.

Ibn Gabirol's reliance on the creative role of the divine will and thus on the voluntariness of creation contrasts dramatically with the tactics of his Greek philosophical predecessors, whose emanationism seemed excessively deterministic to philosophers of a monotheistic stamp. Ibn Gabirol and many of his Jewish successors exalt the voluntariness of the creative act, divine or human. They see the world not as a sequence of predetermined steps or a 'timeless flowing forth of necessity', as a recent commentator has put it (Goodman 1992), but as the free act of God. Ibn Gabirol's postulation of a will that created the world is a Jewish Neoplatonist's way of safeguarding the divine from the necessitarianism of Neoplatonic emanationism. One corollary of this rejection of reductionism is the corresponding safeguarding of human freedom. If creation itself is an act of divine free will, human freedom need not be reduced to the mere product of a rigidly deterministic causal sequence. The freedom of the microcosm recapitulates that of the macrocosm.

Within the created order, matter and form are irreducible to one another (see Matter). They emanate ultimately from different sources and are present at all levels of creation. Indeed, Ibn Gabirol (like Proclus) gives a striking and un-Aristotelian priority to matter, whose ultimate source is God, the first essence. Form derives from the divine will; its source is thus one rung removed from the deity. There is a fine irony here, in giving matter, the almost canonical source of evil, an immediate divine origin. However, the priority and divine origin of matter are driven by the assumption that matter is a genus made determinate by the imposition of successive differentiae.

3 Influence

Ibn Gabirol's philosophical work was destined to have comparatively little direct influence on later Jewish thinkers. Within a century of his death, Aristotelian trends interpenetrated with, altered and displaced Neoplatonic ones. Ibn Gabirol's philosophical influence waned, although it is strikingly visible among some later Jewish Neoplatonists and in Kabbalistic circles. His influence on Christian thinkers, however, was great. Translated into Latin by John of Spain (who may be the Jewish writer Ibn Daud) in collaboration with Dominicus Gundissalinus, the *Fons Vitae* was read and criticized by the Dominican Aristotelians Albertus Magnus (see Albert the Great) and Thomas Aquinas, who rejected outright its doctrine of intelligible matter on the grounds noted above. Franciscans such as Bonaventure and Duns Scotus were more sympathetic, and Ibn Gabirol's hylomorphism seems to have fed the classic scholastic debates on identity and individuation, specifically over whether personal immortality presupposes intelligible matter, or whether form by itself can individuate particulars.

Ibn Gabirol's influence, however, was all but anonymous. His text bore no biblical or rabbinic citations as a sign of its Jewish authorship, and it came down under the (Arabicized) name of Avicebrol (or Avicebron or Avencebrol), a corruption of Ibn Gabirol. The identity of its author with the well-known Hebrew poet was rediscovered only in the nineteenth century by the French scholar Salomon Munk, who recognized fragments quoted from the work in the writings of Shem Tov Ibn Falaquera. Perhaps by historical accident, Ibn Gabirol's philosophy becomes a paradigm of philosophical ecumenism.

Ibn Hazm, Abu Muhammad ‘Ali (994-1063)

Ibn Hazm was the originator of a school of interpretation which based its understanding of religious texts on the apparent meaning of scriptural concepts as opposed to their hidden meaning. He argued that there is a place for reason in the understanding of scripture, but that it has to be used within the context of revelation and is severely limited in terms of what it can demonstrate. His approach is based on the idea that the language and context of religious texts are sufficient for their readers to understand them, and that there is no need to use concepts such as analogy.

Abu Muhammad ‘Ali ibn Hazm was born into an important Andalusian family and went on to have a rather tumultuous political career, being imprisoned three times and banished from Cordoba on several occasions. He is best known for his writings on jurisprudence, and also for his charming *Tawq al-hamama (The Dove’s Neck Ring)*, which deals with the concept of love. In it he analyses the concept and differentiates between divine love, which is placed at the highest level, and affection, which is the lowest. Clearly influenced by Plato’s *Phaedrus* and *Symposium*, he regards love as the coming together of otherwise incomplete beings (see Plato). Genuine love occurs when the lover sees beneath the surface of the appearance something which presents an idea of his own nature, and thus becomes strongly attracted by it. Weaker forms of affection result when the individual is limited to the form of the appearance, but perceives nothing deeper beyond it (see Love).

Ibn Hazm is the leading exponent of the Zahirite school of jurisprudence. This school adheres to the exoteric or apparent (*zahir*) meaning of the religious text, in accordance with the principles of grammar, the *hadith* (traditions) of the Prophet and the consensus (*ijma‘*) of the community. The main opponents of this view are those Muslims who appeal to the esoteric meaning - such as the Isma‘ilis, for example - because they think that one needs to look beyond the surface of the text to discover what it really means, and also the philosophers, who insist that reason is a vital means of gaining access to the meaning of scripture. This is more than a dispute about jurisprudence; it affects the understanding of the way in which texts are to be interpreted. Ibn Hazm attacks the notion that one can understand the meaning of a text by using principles such as analogy, as the Mu‘tazilites do, to acquire some grasp of the nature of God. The latter argue that we can understand the *sifat*, the names or qualities of God, by analogy from our understanding of our own characteristics; so, for example, we can grasp what it means for God to be just if we understand what human justice is (see Ash‘ariyya and Mu‘tazila). According to Ibn Hazm, however, God is a unique being whose qualities cannot be grasped rationally but have to be accepted through faith. There is no objective standard of justice with which God has to concur. He could have obliged us to act in impossible ways, and set out to punish angels and reward the evil. To deny this is to anthropomorphize the concept of God, which is going beyond the nature of the language in Islam about God. The Zahirite uses reason to get an accurate view of the language of the relevant texts and the supplementary hermeneutical material, and stops there (see God, concepts of; Islamic theology).

What role does reason play, then, in Ibn Hazm’s understanding of the meaning of important concepts? Reason is important, and essential in any understanding of the facts. We have to use reason to work out what the facts of a particular situation are, but we cannot use it to identify its ethical or religious character. Within the context of revelation, reason has a role to play, but it is an essentially subsidiary role. In comprehending religious language we have to use reason to interpret the text, but we must be aware of the dangers of overelaborating and departing from the apparent meaning. Sometimes people are impressed with the ability of reason to delve into the mysteries of reality, yet all that emerges are disputes about what texts mean and what the nature of the law is. We can avoid this, according to Ibn Hazm, if we stick to the apparent meaning of the text and maintain the autonomy of God. God can do anything at all, he is absolutely free, and we are very limited in our ability to use reason to encompass him. We can use the laws of logic, Arabic grammar and the evidence of our senses, but that is all.

By the time of his death, Ibn Hazm had succeeded in establishing the Zahiri school of interpretation, which followed his particular approach to hermeneutics and which was solidly within the Asha‘rite and Sunni tradition. The most distinguished follower of this form of thought was al-Ghazali, who was clearly heavily influenced by Ibn Hazm.

Ibn Kammuna (d. 1284)

Physician and man of letters, Ibn Kammuna left a number of writings on philosophy and religion. His treatise comparing Judaism, Christianity and Islam caused major rioting in Baghdad, forcing him to flee that city in secret. His commentary on al-Suhrawardi's Talwihat, the major text of Islamic Illuminationist philosophy remains one of the clearest and most thorough expositions of that branch of thought.

1 Comparative religion

Of the major writings of 'Izz al-Dawla Sa'd bin Mansur ibn Kammuna, only the two that compare the views of religious communities have been published thus far. The longer one, the *Tanqih al-abhath fi akhbar al-milal al-thalath (An Overview of Investigations into the Views of the Three Faiths)* is *sui generis* in medieval literature. It begins with a extended investigation of prophecy, aiming to establish in a manner acceptable to adherents of all faiths (not just the prophetic ones) that revelation does occur. Here as elsewhere, Ibn Kammuna combines ideas culled from highly diverse sources including Moses Maimonides, Judah Halevi, al-Ghazali and Fakhr al-Din al-Razi. The next next three sections examine the most important prophetic traditions: Judaism, Christianity and Islam. Each section opens with an exposition of the basic tenets of the faith concerning its revealed Scripture, followed by a series of queries or objections, and the answers that a defender of that faith may be expected to give.

The presentation is dispassionate and eschews any polemical tone. Ibn Kammuna perhaps hoped that philosophical commitments shared by readers from the different faiths, and the unique political situation - the rulers were pagan Mongols bearing allegiance to none of the three faiths - would allow a calm examination of the scriptures sacred to each. The rioting against his book was perhaps incited by religious leaders, but it is not hard to understand why both Christians and Muslims were moved to write refutations of the book. It gives considerably more space to criticism of the sacred scriptures of the two 'daughter religions' than to the Torah, and it dwells on sectarian and other internal differences in Christianity and Islam but not in Judaism - although elsewhere Ibn Kammuna wrote an entire treatise on the differences between Rabbanites and Karaites.

It is not clear whether Ibn Kammuna attempted to formulate positions reflecting an actual consensus within each community (which would lend even greater historical interest to his text), or whether he forged his own synthesis from a melange of doctrines taken from existing literature. His fusion of the Halevi's chronicle of divine revelation from Adam onwards with Maimonides' rationalistic explanation of the ancient Israelite temple cult is not attested from other sources. It suggests that the book displays an original concatenation rather than an empirical study of views then normative in the three communities.

The treatise on the two major trends within Judaism in his day is considerably shorter. It devotes about twice as much space to Rabbanite views as to the Karaites, leading Leon Nemoy to conclude that, 'dispassionate critic though he was, his sympathies nevertheless remained with the mother synagogue' (Nemoy 1968: 109).

2 The Ishraqi tradition

Ibn Kammuna's commentary on Ibn Sina's *al-Isharat wa 'l-tanbihat* is essentially a paraphrase, reflecting in a few places a somewhat different structure than the published text of Ibn Sina. Among its distinctive features are its division of the sciences, particularly the characterization of mathematical sciences as 'proto-physical' (*ma qabla al-tabiy'a*), balancing the accepted term for metaphysics, as 'what comes after the physics'. Ibn Kammuna offers his own interpretation of the story of Ibn Sina's Salman and Absal (the former symbolizes the rational soul, the latter the speculative intellect) and offers other unusual insights into the gnosis which Ibn Sina sketches in the third part of the book.

Ibn Kammuna's commentary on al-Suhrawardi's *Talwihat* is his longest work and, to judge from the number of surviving manuscripts, his most widely read. It seems to have played no small role in the development the 'illuminationist' (*ishraqi*) school of philosophy. Corbin noted the value of its exposition as well as its critical importance for establishing the text of the *Talwihat*. Nonetheless, about all that is available in print of this work are some brief quotations in Corbin's study and translations of selected passages by Shlomo Pines in footnotes to his studies of Abu 'l Barakat al-Baghdadi. The commentary is encyclopaedic, its discussions much fuller than those in the commentary on Avicenna. It promises to be a rich source for the exposition of Ishraqi philosophy and

for a broad range of topics debated by thinkers of the period. The legitimacy of the so-called fourth figure of the syllogism, the possibility of alchemical transmutation of metals, and the nature of time are among the topics on which Ibn Kammuna offers lengthy disquisitions.

3 Impact

We know from manuscript catalogues that Ibn Kammuna wrote a number of other treatises in addition to those discussed above, but the only one published thus far is a short work on the immortality of the soul, a typically thorough survey. His impact on Jewish thought was minimal at best. Only his treatises on comparative religion and al-Suhrawardi were transcribed into Hebrew characters, none was widely diffused, and no citations of his writings have been found in the work of any other Jewish thinker. His works seem to have addressed the general, rather than the Jewish, public; the most influential of them, as noted, being his commentary on al-Suhrawardi.

Ibn Khaldun, ‘Abd al-Rahman (1332-1406)

Ibn Khaldun’s work on the philosophy of history is a landmark of social thought. Many historians - Greek, Roman, Muslim and other - had written valuable historiography, but here we have brilliant reflections on the meaning, pattern and laws of history and society, as well as profound insights into the nature of social processes and the interconnections between phenomena in such diverse fields as politics, economics, sociology and education. By any reckoning, Ibn Khaldun was the outstanding figure in the social sciences between Aristotle and Machiavelli, and one of the greatest philosophers of history of all time.

His most important philosophical work is the Muqaddima, the introduction to a much longer history of the Arabs and Berbers. In this work, Ibn Khaldun clearly defines a science of culture and expounds on the nature of human society and on political and social cycles. Different social groups, nomads, townspeople and traders, interact with and affect one another in a continuous pattern. Religion played an important part in Ibn Khaldun’s conception of the state, and he followed al-Ghazali rather than Ibn Rushd as a surer guide to the truth.

1 Life and cultural context

Abu Zayd ‘Abd al-Rahman ibn Khaldun al-Hadrami was born in Tunis in AH 732/AD 1332. He was deeply rooted in his Islamic background, occupying high government posts in Granada, Morocco, Algeria, Tunisia and Egypt. He spent four years among the Bedouins, and negotiated with both Pedro the Cruel of Spain in Seville and with Timur Lenk (Tamurlane) on the outskirts of Damascus. He was deeply versed in Arabic literature, theology, historiography, jurisprudence and philosophy, and was particularly influenced in the latter by Averroes or Ibn Rushd. He died in Cairo in AH 808/AD 1406.

Ibn Khaldun lived at a time when it was possible to reflect upon a long and profound period of Islamic thought, and he seems to have felt that part of his function as a writer was to sum up this period, with the further aim of pointing towards the future of Islamic intellectual enquiry. As one would expect, he used the terms and concepts of his time, and some have argued that he was a culturally-specific phenomenon (al-Azmeh 1981), so that any attempt at interpreting his thought in Western terms must distort it fatally. This is an error. Like all great thinkers, Ibn Khaldun’s thought contains both specific and universal elements, and the latter can readily be conveyed to modern readers with no more than the usual difficulties of translation from one cultural and historical period to another.

2 Philosophy of history

The work on which Ibn Khaldun’s reputation chiefly rests is the *Muqaddima*, the introduction to his great history of the Arabs and Berbers, the *Kitab al-‘ibar*, which is divided into a further six books. In the first book he presents a general account of sociology, in the second and third a sociology of politics, in the fourth a sociology of urban life, in the fifth a sociology of economics and in the sixth a sociology of knowledge. The whole work is studded with brilliant observations. Thus in the field of economics, Ibn Khaldun understands very clearly the supply and demand factors which affect price, the interdependence of prices and the ripple effects on successive stages of production of a fall in prices, and the nature and function of money and its tendency to circulate from country to country according to demand and the level of activity. In his writings on public finance, he shows why at the beginning of a dynasty taxation yields a large revenue from low rates of assessment, but at the end a small revenue from high rates of assessment. Elsewhere his observations on the evolution of the Arabic language and script are masterly examples of sociological analysis, and his remarks on the difference between acquiring a skill in a language and learning its grammar, and on the use of intuition as opposed to logic in solving difficult problems, can still be read with profit.

However, it is Ibn Khaldun’s views on the nature of the state and society which reveal most clearly both his profundity and the originality that marks him off so sharply from his Muslim predecessors and successors. Ibn Khaldun fully realised that he had created a new discipline, *‘ilm al-‘umran*, the science of culture, and regarded it as surprising that no one had done so before and demarcated it from other disciplines. This science can be of great help to the historian by creating a standard by which to judge accounts of past events. Through the study of human society, one can distinguish between the possible and the impossible, and so distinguish between those of its

phenomena which are essential and those which are merely accidental, and also those which cannot occur at all. He analysed in detail the sources of error in historical writings, in particular partisanship, overconfidence in sources, failure to understand what is intended, a mistaken belief in the truth, the inability to place an event in its real context, the desire to gain the favour of those in high rank, exaggeration, and what he regarded as the most important of all, ignorance of the laws governing the transformation of human society. Ibn Khaldun’s attitude to the study of social phenomena is suffused with a spirit which has caused several commentators to call him the founder of sociology. His attempt at creating a theoretical structure for the analysis of history is a very impressive contribution to the philosophy of history (see History, philosophy of; Society, concept of).

For Ibn Khaldun, human society is necessary since the individual acting alone could acquire neither the necessary food nor security. Only the division of labour, in and through society, makes this possible. The state arises through the need of a restraining force to curb the natural aggression of humanity. A state is inconceivable without a society, while a society is well-nigh impossible without a state (see Political philosophy in classical Islam). Social phenomena seem to obey laws which, while not as absolute as those governing natural phenomena, are sufficiently constant to cause social events to follow regular and well-defined patterns and sequences. Hence a grasp of these laws enables the sociologist to understand the trend of events. These laws operate on masses and cannot be significantly influenced by isolated individuals. There is very little talk of ‘great men’ in Ibn Khaldun’s books; while individuals do affect the course of events, their influence is very limited.

The overwhelming impression given by Ibn Khaldun’s writings is that society is an organism that obeys its own inner laws. These laws can be discovered by applying human reason to data either culled from historical records or obtained by direct observation. These data are fitted into an implicit framework derived from his views on human and social nature, his religious beliefs and the legal precepts and philosophical principles to which he adheres. He argues that more or less the same set of laws operates across societies with the same kind of structure, so that his remarks about nomads apply equally well to Arab Bedouins, both contemporary and pre-Islamic, and to Berbers, Turkomen and Kurds. These laws are explicable sociologically, and are not a mere reflection of biological impulses or physical factors. To be sure, facts such as climate and food are important, but he attributes greater influence to such purely social factors as cohesion, occupation and wealth. This comes out very clearly in his discussion of national characters, for example of Arabs, Persians and Jews, where he is careful to point out that what are regarded as characteristic features can be explained by sociological factors such as nomadism, urbanization and oppression. Similarly, different social groups, such as townspeople, nomads and traders, have their own characteristics derived from their occupations.

Ibn Khaldun sees the historical process as one of constant cyclical change, due mainly to the interaction of two groups, nomads and townspeople. These form the two poles of his mental map; peasants are in between, supplying the towns with food and tax revenue and taking handicrafts in return. Nomads are rough, savage and uncultured, and their presence is always inimical to civilization; however, they are hardy, frugal, uncorrupt in morals, freedom-loving and self-reliant, and so make excellent fighters. In addition, they have a strong sense of *‘asabiya*, which can be translated as ‘group cohesion’ or ‘social solidarity’. This greatly enhances their military potential. Towns, by contrast, are the seats of the crafts, the sciences, the arts and culture. Yet luxury corrupts them, and as a result they become a liability to the state, like women and children who need to be protected. Solidarity is completely relaxed and the arts of defending oneself and of attacking the enemy are forgotten, so they are no match for conquering nomads.

Ibn Khaldun then traces very clearly the political and social cycle. Nomads conquer territories and their leaders establish a new dynasty. At first the new rulers retain their tribal virtues and solidarity, but soon they seek to concentrate all authority in their own hands. Increasingly they rule through a bureaucracy of clients - often foreigners. As their former supporters lose their military virtues there is an increasing use of mercenaries, and soldiers come to be more important than civilians. Luxury corrupts ethical life, and the population decreases. Rising expenditure demands higher taxes, which discourage production and eventually result in lower revenues. The ruler and his clients become isolated from the groups that originally brought them to power. Such a process of decline is taken to last three generations, or about one hundred and twenty years. Religion can influence the nature of such a model; when *‘asabiya* is reinforced by religion its strength is multiplied, and great empires can be founded. Religion can also reinforce the cohesion of an established state. Yet the endless cycle of flowering and decay shows no evolution or progress except for that from the primitive to civilized society.

Ibn Khaldun does occasionally refer to the existence of turning points in history, and thought that he was himself witnessing one of them. The main cause for this great change was the Black Death, which had a profound effect upon Muslim society, together with the Mongol invasions; and he may also have been impressed by the development of Europe, whose merchants and ships thronged the seaports of North Africa and whose soldiers served as mercenaries in the Muslim armies. He suggests that a general change in conditions can produce an entirely new social and political scene, rather as if a new world had been created.

3 Critique of Islamic philosophy

Ibn Khaldun wrote on other topics apart from history, although in his autobiography he is rather coy about admitting it. In his *Shifa' al-sa'il (The Healing of the Seeker)*, he responds to the question as to whether it is possible to attain mystical knowledge without the help of a Sufi master leading the novice along the path. Ibn Khaldun tends to follow al-Ghazali (§3) in reconciling mysticism with theology, but he goes further than the latter in bringing mysticism completely within the purview of the jurisprudent (*faqih*) and in developing a model of the Sufi *shaykh*, or master, as rather similar to the theologian. The fourteenth century, in which Ibn Khaldun was working, was very strongly influenced by what Fakhry (1970) calls 'neo-Hanbalism', which brought with it a strong suspicion of the claims of both mysticism and philosophy. Philosophy was regarded as going beyond its appropriate level of discourse, in that 'the intellect should not be used to weigh such matters as the oneness of God, the other world, the truth of prophecy, the real character of the divine attributes, or anything else that lies beyond the level of the intellect' (*Muqaddima* 3, 38). He refers to the intellect as like a balance which is meant for gold, but which is sometimes inappropriately used for weighing mountains. Logic cannot be applied to this area of enquiry, and must be restricted to non-theological topics (see Logic in Islamic philosophy).

Ibn Khaldun is also critical of Neoplatonic philosophy (see Neoplatonism in Islamic philosophy). The main object of his criticism is the notion of a hierarchy of being, according to which human thought can be progressively purified until it encompasses the First Intellect which is identified with the necessary being, that is, God. He argued that this process is inconceivable without the participation of revelation, so that it is impossible for human beings to achieve the highest level of understanding and happiness through the use of reason alone. Interestingly, the basis of his argument here rests on the irreducibility of the empirical nature of our knowledge of facts, which cannot then be converted into abstract and pure concepts at a higher level of human consciousness.

Ibn Khaldun also had little respect for the political theories of thinkers like al-Farabi (§4), with their notions of rational government being based upon an ideal prophetic law. He saw little point in using theories which dealt with ideals that have nothing to do with the practicalities of contemporary political life. Although Ibn Khaldun rarely agrees with Ibn Rushd, there is no doubt that his thought is strongly marked by the controversy between him and al-Ghazali, the latter being acknowledged as the surer guide to the truth. The basis of Ibn Khaldun's critique of philosophy is his adherence to the notion of the state. Religion has a vital role in society, and any argument that it can be identified with either reason or contact with God is to threaten that function. This is doubtless the basis of his attack on Islamic philosophy and on mysticism.

Although Ibn Khaldun is hostile to a version of Islamic philosophy, his discussion of society is full of observations and ideas which clearly have as their source philosophical distinctions. For example, his account of the three stages in the development of the state, from the nomadic to the militant and finally to the luxurious and decadent is modelled on the three types of soul in Greek thought (see Soul in Islamic philosophy §2), as is his notion of *'asabiya*, of the spirit of cohesion, as a point of equilibrium between different aspects of the soul. One of the features of Ibn Khaldun's work which makes it so thought-provoking is the tension, which he never finally resolved, between a concern to acknowledge the facts of historical change while at the same time bringing those facts under very general theoretical principles. His contribution to the philosophy of history is outstanding.

Ibn Masarra, Muhammad ibn ‘Abd Allah (883-931)

Muhammad ibn Masarra is said to be responsible for the first structuring of Andalusian Spanish Muslim philosophy. The thrust of his philosophy was to show the agreement between reason and revelation. The two paths taken by honest philosophers and prophets lead to the same goal of reaching the knowledge of the oneness of God. We can only know that God exists but not what His nature is. Ibn Masarra held that the divine attributes of knowledge, will and power are a distinct aspect of the simple and ineffable essence of God, and the Neoplatonic theory that all beings have emanated from him through the First Intellect and are either invisible or apparent. There are two sciences, one of the invisible, transcendental world, the other of the apparent and sensible world. The inner meanings in the sciences can be learned through the science of letters. By studying the enigmatic letters at the beginning of the Qur'anic surahs, *one can decipher the secret knowledge of the truth symbolized by them.*

1 Life and times

Muhammad ibn ‘Abd Allah ibn Masarra was born in Cordoba, Spain, in AH 269/AD 883 and died in AH 319/AD 931. In a hermitage he had founded for his friends and disciples in the Sierra of Cordoba, Ibn Masarra undertook to instruct them in his doctrines, to initiate them into the use of esoteric knowledge and to practice *zuhd* (asceticism) through acts of penance and devotion. His success came from a Socratic style of pedagogy as well as a charismatic personality and skill in communication. After his death the jurists carried out a veritable persecution of his disciples; who had formed themselves into an ascetic order, the Masarriya, in Cordoba and later in Almeria.

Two of Ibn Masarra’s four works, *Kitab al-i‘tibar (On Reflection)* and *Kitab khawass al-huruf (Characteristics of Letters)*, were published in 1982. Both are short tracts which have provided a better understanding of his thought, but because of their conciseness they raise new questions. It is still not possible to reconstruct his philosophical system until the remaining works are found, especially his *Tawhid al-muqinin (The Certain Profession of the Oneness of God)*, where he discussed God’s attributes.

2 Doctrines

M. Asín Palacios, the Spanish scholar who first reconstructed an integral account of Ibn Masarra’s life and thought, concluded that he was the first Andalusian to structure Spanish Islamic philosophy (*hikma*) and that he conveyed his doctrines in a series of *batini* (inward) esoteric images and symbols (Asín Palacios 1972). The centrepiece of Asín’s thesis, however, was the elaboration of a whole theory of Ibn Masarra’s inspiration from a pseudo-Empedocles, who had developed a peculiar form of Plotinian ideas on the One and the five eternal substances of Primal Matter, Intellect, Soul, Nature and Secondary Matter. According to Asín, Ibn Masarra was the founder of a philosophical-mystical school which influenced Jewish, Christian and Muslim medieval philosophers. Andalusian Sufism from Isma‘il al-Ru‘ayni (d. AH 555/AD 1268) to Ibn al-‘Arabi by way of Ibn al-‘Arif (d. AH 536/AD 1141) sprang from the Masarri school.

The thrust of Ibn Masarra’s philosophy is to demonstrate the agreement of reason and revelation. Each takes a different path leading to the same goal, *al-tawhid*, the knowledge of the oneness of God. By using *‘aql*, the intellect with which God endowed human beings, they reflect on God’s signs and rise step by step to the knowledge of the Truth. Those who ascend by way of reason proceed from the bottom up and discover the same truth the Prophets have brought down from on high. In fact, the Qur’an invites us to reflect on the signs of his creation. Reflection (*i‘tibar*) only confirms prophecy; what is learned by authority (*sama‘*) is confirmed by investigation. Ibn Masarra admits, however, that the philosophers and the ancients had attained the knowledge of the true One well before the age of prophecy and without its mediation, a position not acceptable to the religious scholars.

Ibn Masarra conceives of two sciences both created by God. One, the science of the invisible and intelligible reality (*‘ilm al-ghayb*), which cannot be grasped by the senses, is created whole, entire and at once. The other is the science of the apparent and sensible reality (*‘ilm al-shahada*) (Surah 6: 73). The Qur’an, the speech of God, is one whole in its divine essence, but diversified (*mufassal*) with respect to creation. It displays three aspects, each the subject of a different science: the science of divinity (*rububiya*), its signs, evidences and certainty; the science of prophecy with its demonstrative arguments, signs and necessity; and the science of tribulation (*mihna*) with its

laws, promises and threats.

3 God’s attributes

God transcends all human thought and all we can know about his nature is that he exists. His attributes are distinct from him, that is, from his essence (*dhat*). They are, however, related to each other. Strangely enough, Ibn Masarra concludes from that relationship the finitude or creation of the attributes. Like many Mu‘tazilite theologians of his time in the East, he distinguished between the attributes of the essence, which are eternal, and the attributes of action, which are created. This was a way to which the Mu‘tazilites resorted in order to assert the oneness and ineffability of God while maintaining human free will and responsibility. God’s knowledge is only of universals; were he to know particulars, his oneness would be jeopardized and our moral responsibility denied.

In making the distinction between God’s essence and his action, Ibn Masarra established three hierarchical attributes, the highest of which is connected to God’s essence and the other two to his actions. These are divinity (*aluhiya*), royalty (*mulk*) and grace (*ni‘ma*) or creation (*khalq*), through which God the Artificer (*al-sani‘*) is manifested. This hierarchy is reflected in the way human society is organized.

4 God’s creation

All beings are divided into four categories, some nobler than others in accordance with the following scheme. First, there is the Being, or essence of God (*dhat*), separate, unique, ineffable, infinite and motionless; it is the ultimate, the visible and the invisible. The remaining beings are the signs that point to Him. Second is the Universal Intellect (*al-‘aql al-kulli*), which is the conception or idea of things. It is spiritual by nature and permanent. It is the Mother of the Book (*umm al-kitab*) (Surah 3: 6), and the Preserved Tablet (*al-lawh al-mahfuz*) (Surah 85: 21) on which all things are inscribed. The totality of what is in the Book is the idea (*mithal*, Eidos) of the universe, whatever was, is or shall be. It is also the Throne (Surah 10: 2) which incites motion in response to God’s volition and will. The relationship of the Intellect to God is similar to the relation of the sun’s light to the sun. Third is the Great Soul (*al-nafs al-kubra*) that carries the body of the universe. The relation of the Soul to the Intellect is like the light of the moon to that of the sun. Through this Soul, immersed in materiality, Royalty (*mulk*) is constituted and the celestial spheres are held. To Royalty are predicated government and politics. Finally, lower than the Great Soul is the Physical Soul (*al-nafs al-tabi’iya*), which is completely immersed in corporeality and is the efficient cause of corporeal beings. The Throne encloses the invisible world (*‘alam al-ghayb*) and the Great Soul encloses the visible (*‘alam al-shahada*).

The origination of the cosmos has been achieved in time by the command ‘Be’ (*kun*), expressing the volition and will according to knowledge. When the One wants to do something, he causes it to appear in the Preserved Tablet. This in itself is the command (*amr*) to set the idea into action by his willing. God, according to him, is concealed from creation by two veils from the perspective of his creation, inasmuch as nothing can conceal him from the perspective of his essence. Motion is then set by the Throne, since no action *ad extra* can be attributed to the One.

Unlike the pseudo-Empedocles, who conceived of love and discord as the driving force of creation, Ibn Masarra talked about capacity and power designating them as truth (*haqq*) (Surah 2: 72). In the final analysis God is the Aristotelian unmoved mover, but in Neoplatonic style all creation emanates from him. Unlike Plotinus, Ibn Massara finds that the processes of emanation and creation are the results of God’s will (*irada*) and deliberate action. Both he and Plotinus agree on the intermediary roles played by the Intellect and the Soul in the creation of the material world, but whereas Plotinus believed in involuntary emanation, Ibn Massara retained the Islamic view of voluntary creation (see Neoplatonism; Neoplatonism in Islamic philosophy).

The principles from which all creatures have come are fourteen in number, ten of which are in the sublunar world: chaos (*al-‘ama’*), primordial dust (*al-haba’*), which is considered by some as the *materia prima*, air, wind, atmosphere, water, fire, light, darkness and clay. The remaining four, the Pen (*qalam*), the Tablet, the Command and the Spiritual locus (*makan*) exist in the world above. From the fourteen are made the Throne, paradise, hell, the seven heavens, the earth, the angels, the jinn, human beings, animals and vegetation.

5 Esoterism and mysticism

In his work *Kitab khawass al-huruf (Book of the Characteristics of Letters)*, Ibn Masarra appears as an esoteric

(*batini*) philosopher investigating the esoteric meanings of the *nuraniya*, the fourteen separate letters which introduce certain surahs of the Qur’an, basically following the tradition of Islamic gnosis. The mysterious letters, according to the Batini school, represented the universe so that its entirety is a book whose letters are God’s words. The ‘science of letters’ followed by Ibn Masarra had nothing to do with divination or magic; it is merely a path to the discovery of the truths hidden behind the symbols. In this he was inspired by the work of Sahl al-Tustari (d. AH 283/AD 896), the author of a similar work on the science of letters.

Reflection (*i‘tibar*) allows us to decipher the principles of all beings. The basic idea is to show that the different degrees that constitute beings in general correspond to the surah’s *fawatih* (opening letters) as well as to the order of being. The letters are twenty-eight in number, equal to the length of the lunar phases. Fourteen are exoteric and the remaining fourteen are esoteric. These are used by God to manifest his knowledge: their secret meanings have been bestowed upon the Prophet Muhammad as expressed in the Qur’an, and consequently the Qur’an is the source of all knowledge, old and new. The steps leading to paradise and salvation are equal in number to the Qur’anic verses and to the number of God’s beautiful names, excepting the great name of Allah.

The first letter, *alif*, is the alpha and omega of all letters inasmuch as it represents the principle of all things. It is the first manifestation of God and his will; it is a metaphor for the production of things (*takwin*), the emergence of justice and the permanent and unchanging primordial decree (*al-qada’ al-awwal*). It never rests and continuously causes generation and corruption. This decree has two aspects. A prior aspect (*sabiq*) is connected to the Preserved Tablet, the tablet of the Universal Intellect where all things are inscribed. This is a decree that does not respond to invocation. The second aspect, the diversifier (*mufassil*), particularizes all things that are not permanent. Like the other attributes, the two decrees manifesting God’s knowledge and power are other than God, although they are not created in time. The concept of *huduth*, or coming to be, is realized only in time; but God’s knowledge, according to Ibn Masarra, whether it is knowledge of the universals or particulars, is not in time. Coming to be in time is the particularization of beings found in a locus performed by that decree that particularizes things and responds to invocation.

Human salvation can be achieved through either the *via reflectiva* or the *via prophetica*, an idea considered heretical by most Muslim theologians (see Islamic theology). In both cases, individuals have to follow certain rules in order to free their souls from the bondage of materiality. Ibn Masarra distinguishes clearly between the soul (*ruh*) and spirit (*nafs*), with the latter being the prototype (*mithal*) of the first.

There is a tradition in Andalusian literature to the effect that Ibn Masarra enjoyed great respect and veneration in spite of the fact that his teachings were criticized and refuted. On the other hand, his disciples were persecuted. Transformed into an ascetic society, his disciples first in Cordova and later in Almeria put into practice his Sufi and esoteric teachings. He is certainly one of the first mystical-philosophical Andalusians. His Sufi teachings as well as his works continued to circulate and to be studied for centuries. His influence on Ibn al-‘Arabi is attested by the many references to him in the latter’s works and by similarity in a number of ideas, especially in the continuous use of similes of light and illumination to describe the essence of God.

Ibn Miskawayh, Ahmad ibn Muhammad (*c.*940-1030)

Like so many of his contemporaries in the fourth and fifth centuries AH *(tenth and eleventh centuries* AD*) Ibn Miskawayh was eclectic in philosophy, basing his approach upon the rich variety of Greek philosophy that had been translated into Arabic. Although he applied that philosophy to specifically Islamic problems, he rarely used religion to modify philosophy, and so came to be known as very much an Islamic humanist. He represents the tendency in Islamic philosophy to fit Islam into a wider system of rational practices common to all humanity.*

Ibn Miskawayh's Neoplatonism has both a practical and a theoretical side. He provides rules for the preservation of moral health based on a view of the cultivation of character. These describe the ways in which the various parts of the soul can be brought together into harmony, so achieving happiness. It is the role of the moral philosopher to prescribe rules for moral health, just as the doctor prescribes rules for physical health. Moral health is based upon a combination of intellectual development and practical action.

1 Metaphysics

Like so many of his philosophical contemporaries, Ahmad ibn Muhammad ibn Miskawayh, born in Rayy in Persia *c.*AH 320/AD 940, combined an active political career with an important philosophical role. A historian as well as a philosopher, he served as a Buwayhid official at Baghdad, Isfahan and Rayy. He was a member of the distinguished group of intellectuals including al-Tawhidi and al-Sijistani. He died in AH 421/AD 1030. Although not an important figure on the creative side of Islamic philosophy, he is a very interesting adaptor of existing ideas, especially those arising out of the Neoplatonic tradition in the Islamic world (see Neoplatonism in Islamic philosophy).

Ibn Miskawayh wrote on a wide variety of topics, ranging from history to psychology and chemistry, but in philosophy his metaphysics seems to have been generally informed by a version of Neoplatonism. He avoids the problem of reconciling religion with philosophy by claiming that the Greek philosophers were in no doubt concerning the unity and existence of God. He goes so far as to suggest that Aristotle's identification of the creator with an unmoved mover is a powerful argument in favour of a creator acceptable to Islam, since the very distinct nature of such a being prevents our normal categories of description from making sense. Such a creator can only be described in terms of negative concepts, an interesting prefigurement of the tradition of the *via negativa* in philosophy. He has an unusual account of emanation, wherein the deity produces the active intellect, the soul and the heavens without intermediaries, making one suspect that he did not have a firm grasp of the distinction between emanation and creation. The normal Neoplatonic account of emanation then current in Islamic philosophy used the notion of a scale of being that separates these different divine products far more radically. It is difficult to see how Ibn Miskawayh really reconciles metaphysical difficulties at this point.

2 Ethical writings

Ibn Miskawayh's work on ethics, however, is of a much higher order, and does show evidence of considerable conceptual complexity. In his *Taharat al-a'raq (Purity of Dispositions)*, better known as *Tahdhib al-akhlaq (Cultivation of Morals)* - which is not to be confused by the work of the same name by Yahya Ibn 'Adi - he sets out to show how we might acquire the right dispositions to perform morally correct actions in an organized and systematic manner.

The basis of his argument is his account, adopted from Plato, of the nature of the soul, which he sees as a self-subsisting entity or substance, in marked contrast to the Aristotelian notion (see Soul, nature and immortality of the). The soul distinguishes us from animals, from other human beings and from things, and it uses the body and the parts of the body to attempt to come into contact with more spiritual realms of being. The soul cannot be an accident (or property of the body) because it has the power to distinguish between accidents and essential concepts and is not limited to awareness of accidental things by the senses. Rather, it can apprehend a great variety of immaterial and abstract entities. If the soul were only an accident it could do none of these things, but could only perform in the limited way of the physical parts of the body. The soul is not an accident, and when we want to concentrate upon abstract issues the body is actually an obstruction that we must avoid if we are to make contact with intelligible reality. The soul, then, is an immortal and independent substance that controls the body. It has an

essence opposite to that of the body, and so cannot die; it is involved in an eternal and circular motion, replicated by the organization of the heavens. This motion takes two directions, either upwards towards reason and the active intellect or downwards towards matter. Our happiness arises through upwards movement, our misfortunes through movement in the opposite direction.

Ibn Miskawayh's discussion of virtue combines Aristotelian with Platonic ideas (see Virtue ethics). Virtue is the perfection of the aspect of the soul (that is, human reason) that represents the essence of humanity and distinguishes it from lower forms of existence. Our virtue increases in so far as we develop and improve our ability to deliberate and apply reason to our lives. We should do this in accordance with the mean, the point most distant from two extremes, and justice results when we manage to achieve this. Ibn Miskawayh combines the Platonic division of virtues with an Aristotelian understanding of what virtue actually is, and adds to this the idea that the more these virtues can be treated as a unity, the better. This is because, he argues, that unity is equivalent to perfection, while multiplicity is equivalent to a meaningless plurality of physical objects. This idea is not just based upon a Pythagorean aesthetic (see Pythagoreanism). Ibn Miskawayh argues further that the notion of justice when it deals with eternal and immaterial principles is a simple idea, while human justice by contrast is variable and depends upon the changing nature of particular states and communities. The law of the state is based upon the contingent features of the time, while the divine law specifies what is to be done everywhere and at every time.

Ibn Miskawayh uses the notion of friendship to distinguish between those relationships that are essentially transitory and variable (in particular those based upon pleasure) and those based upon the intellect, which are also pleasurable but not in a physical way. Our souls can recognize similarly perfected souls, and as a result enjoy intense intellectual delight. This is very different from the normal kind of friendship, in which people form relationships with each other because they want to get something out of it. Still, even those capable of the most perfect form of relationship have to involve themselves in the less perfect levels of friendship, since they must live in society if they are to achieve perfection, and so must satisfy at least some of the expectations of society (see Friendship). The highest form of happiness exists when we can abandon the requirements of this world and are able to receive the emanations flowing from above that will perfect our intellects and enable us to be illuminated by divine light. The eventual aim seems to be the throwing off of the trappings of our physical existence and following entirely spiritual aims in mystical contemplation of the deity.

3 Practical ethics and humanism

This mystical level of happiness seems to rank higher than mere intellectual perfection, yet Ibn Miskawayh is particularly interesting in the practical advice he gives on how to develop our ordinary capacity for virtue. He regards the cultivation of our moral health in a very Aristotelian way as akin to the cultivation of physical health, requiring measures to preserve our moral equilibrium (see Aristotle §§23-6). We ought to keep our emotions under control and carry out practices that help both to restrain us on particular occasions and also to develop personality traits that will maintain that level of restraint throughout our lives. To eradicate faults, we must investigate their ultimate causes and seek to replace these with more helpful alternatives. Take the fear of death, for example: this is a baseless fear, since the soul is immortal and cannot die. Our bodies will perish, but they must do so since we are contingent; to acknowledge that contingency and also to wish that we were not thus contingent is some sort of contradiction. If we are worried by the pain involved in dying, then it is the pain we fear, not death itself. Ibn Miskawayh argues, along with al-Kindi (§3) and the Cynics and Stoics who no doubt influenced him on this issue, that to reconcile ourselves to reality we have to understand the real nature of our feelings (see Cynics; Stoicism). We have to use reason to work out what we should do and feel, since otherwise we are at the mercy of our feelings and the varying influences that come to us from outside ourselves (see Death).

This emphasis upon the capacity of the human mind to use reason to help us determine what we should do and who we are has led the most distinguished commentator on Ibn Miskawayh, Mohammed Arkoun (1970), to call him a humanist and part of the general humanist movement of his time. It is certainly true that religion plays a small part in Ibn Miskawayh's writings, and when he does consider Islam he often gives its religious practices a rather instrumental rationale. Al-Ghazali (§2) was infuriated by Ibn Miskawayh's suggestion that the point of communal prayer is to base religion upon the natural gregariousness of human beings in society. This seemed to al-Ghazali to disparage the religious enterprise, since he argued that the significance of religious rituals is that they are specified by the religion, and there can be no other reason. Their rationale is that they are unreasonable. God indicates the

huge gap that exists between him and us by setting us unpleasant and difficult tasks. For Ibn Miskawayh, the reason for the ritual is that it has a part to play in helping us adapt to religious life, using the dispositions that are natural to us, so that the rules and customs of religion are essentially reasonable. A whole range of authorities may be consulted to help us understand our religious duties concerning how we are to live and what we are to believe; some of these are Islamic, while others are not. Ibn Miskawayh seems on the whole to accord greater respect to Greek rather than specifically Islamic authorities.

Ibn Miskawayh's thought proved to be influential. His style, combining abstract thought with practical observations, is attractive and remained popular long after his death. Sometimes he merely presents aspects of 'wisdom' literature from previous cultures; sometimes he provides practical comments upon moral problems that are entirely unanalytical. At its best, however, his philosophy is highly analytical and maintains a high degree of coherence and consistency. The fact that he mixes together aspects of Plato, Aristotle, Pythagoras, Galen and other thinkers influenced by Greek philosophy is not an indication of cultural looting but rather a creative attempt at using these different approaches to cast light upon important issues.

Ibn Miskawayh shows how possible it is to combine a Platonic conception of the soul with an Aristotelian account of moral development. The idea of a still higher realm of being at which the soul comes into contact with divine reality is a perfectly feasible addition to the account he gives of social and intellectual life. He never imports the notion of revelation to resolve theoretical difficulties, and we have seen how his approach both annoyed and stimulated al-Ghazali. It is perhaps the combination in Ibn Miskawayh of elegance of style, practical relevance and philosophical rigour that prolonged his influence in the Islamic world.

Ibn Paquda, Bahya (*fl.* early 12th century)

Bahya ibn Paquda, the chief exponent of Jewish pietism, gave that ecumenical strand of thought and practice a markedly philosophical cast, preferring the intellectual to the fideistic side of pietist tradition, and embracing rationalism as the ally of faith rather than rejecting it as an enemy. Drawing selectively from Muslim as well as Jewish sources, Bahya's spiritual vademecum, *al-Hidaya ila fara'id al-qulub (The Book of Guidance to the Duties of the Heart), was widely studied ever since its composition, especially in its medieval Hebrew translation, and parts of it are even included in the liturgical meditations of the Ten Days of Penitence. In it, Bahya thematizes his materials carefully, using his own sense of the reasonable to structure pietism as a philosophical system, controlling the monistic penchant of mysticism and disciplining the ascetic tendencies of the devotional cast of mind. Maimonides found Bahya's asceticism excessive and rejected Bahya's related leanings towards predestinarianism and resignation; but he quietly adopted Bahya's moral and intellectual interpretation of the mystic quest for unity with God, fell into step with his predilection for spiritual immortality as distinguished from bodily resurrection, echoed his affirmation of God's absolute unity and simplicity, and concurred in his admiration for negative theology, the theology of divine transcendence.*

1 General character of Bahya's thought

Born in the later eleventh century, Bahya ibn Paquda flourished in Saragossa and served as a rabbinic judge. He is the probable author of some twenty Hebrew *piyyutim*, or hymns, extant under the name Bahya, but his best known work is the fountainhead of Jewish philosophical pietism, *al-Hidaya ila fara'id al-qulub (The Book of Guidance to the Duties of the Heart)*, widely circulated since medieval times in the Hebrew translation (1161) of Judah ibn Tibbon and thus familiar to traditional Jews as *Hovot ha-Levavot*. This version, although its struggle for literalism sacrifices the fluidity of the original, was widely copied and abstracted in manuscript and first printed at Naples in 1489, again at Venice in 1548, and more critically at Mantua in 1559. It attracted Hebrew commentaries by various hands including those published in 1691, 1774, 1790, 1803 and 1836, and was translated into Portuguese, Italian, German, Spanish, Ladino, Yiddish, Arabic(!), French and English.

Steeped in Biblical and Rabbinic learning and the philosophy of Saadiah Gaon, Bahya also knows the Greek philosophers and Galen in their Arabic texts. He draws upon *kalam* and Sufi writers and the Shi‘ite group known as the Sincere Brethren of Basra (see Ikhwan al-Safa'), whose cosmopolitan and humanistic pietism is akin to his own. Bahya does not seem to know the work of Avicenna; he shows numerous affinities to the writings of al-Ghazali, but exhibits a milder spirit and far greater confidence in the philosophical tradition. It is no longer believed that al-Ghazali was a source for him; rather, the two seem to share common sources in Sufi literature.

2 The duties of the heart

Complaining of the externalism prominent in Jewish religiosity, attention to the 'duties of the limbs' rather to the detriment of the inward or spiritual 'duties of the heart', Bahya announces at the outset of his magnum opus that he intends to redress the balance. The heart here is our spiritual identity, celebrated by Pascal but named as early as the charge in Deuteronomy that we must love God with all our hearts. As Bahya's Muslim contemporary al-Ghazali carefully notes, the heart in this instance is not the physical organ. Bahya does not contrast reason with the promptings of the heart. On the contrary, the heart for him includes the mind. He argues dialectically that external obligations depend for their motivation on the commitment of the heart and that intention, which is rooted in heart, is of essence in determining the status of our acts, even at so behavioural a level as in the determination of the difference between murder and manslaughter. But the roots of sound intention must lie in understanding, and those who would attain the ideal of obedience to God's commandments must therefore pursue wisdom.

Wisdom comprises physics, mathematics and theology, the three canonical branches of philosophical exploration. It is theology that is crucial in religion and that makes philosophy a religious obligation. The weak-minded rightly rely on tradition and authority to frame their outlook, but those of more penetrating mind have an obligation to explore the foundations of faith and action, lest their actions be at odds with their intentions, through the incoherency or inadequacy of their understanding. In matters of law, it was long ago established that the majority decision of the learned is determinative of practice; here, convention, grounded in scriptural revelation, will suffice. But in theology we must probe the tradition, seeking not merely uniformity but the comprehension that

will inform our lives. The argument is a pietist's counterpart to the Socratic thesis that the unexamined life is not worth living (see Socrates §4).

Bahya organizes his treatise around ten pietist virtues, a thematic easily lost sight of if we translate the title of the first of his ten chapters as 'On the Unity of God'. The title, *Tawhid*, in fact means monotheism, the affirmation of God's unity, and it is here in the first instance that Bahya seeks to bring philosophy to the aid of piety by clarifying the content of monotheistic belief. Such belief is to be affirmed by the heart, not merely uttered by the tongue. Its affirmation is our primal religious obligation, because from it flow all the rest. But if commitment to God is to be a ground of our intentions, that commitment must be conceptually lucid and firmly understood. Ordinary Israelites may content themselves with the apologetics of *kalam* (dialectical theology), but those who are capable of the understanding ordained by Deuteronomy (4: 39, 'lay it to heart') are obliged to delve beneath rote faith. They must seek deeper understanding not only for the sake of countrymen who need philosophical aid, but also for the nations of the world. In this way they contribute to the fulfilment of the prophecy (Isaiah 2: 3) that God's word will issue forth from Zion.

Such inquirers will find grounds for their belief in the beauty and order of the cosmos and in the recognition that nothing can create itself. Rather, the whole ontic hierarchy, the architecture of heaven and earth rises to the utter simplicity of God and the primal source of differentiation, in his will. To Moses, God revealed himself conceptually as 'I am that I am', but to lesser minds, he is revealed as a figure of tradition, 'God of Abraham, God of Isaac, and God of Jacob'.

The second virtue is reflectiveness (*'i'tibar*), leading to fruitful meditations on creation and God's grace toward it. The study of nature is not merely a way of recognizing God's creative powers but also a way of exercising our own God-given potential, raising ourselves above the animal level. When Isaiah (40: 26) exhorts us 'Lift up your eyes on high and behold who created these things', we can learn from rabbinic teaching (Shabbat 75a) that one who is able to study astronomy but does not is among those who 'regard not the work of the Lord' (Isaiah 5: 12).

The boundedness of nature, the microcosm of human anatomy, the utility of the human faculties, the usefulness of all creatures in sustaining the world at large and ourselves in particular, the system of the arts and sciences, and the beauties of God's law are all objects of intellectual wonder, instruction and delight that draw the mind upward toward God. Man is the chief but not the sole object of creation, and it is through self-examination, as practised in philosophy that we gain our clearest apprehension of God's work and grace in nature.

The third virtue is obedience to God, a reasonable response to the grace we have received. Even if our performance is imperfect, we should try to make our intentions pure, although God alone acts entirely without self-interest. Human nature rests on a deep duality that generates inevitable tensions. We have a desire and appetite to populate the earth. However, we reach understanding only through self-denial, that is, denial of the lower self, the ego, which pietists sharply distinguish from the seat of pure intentions, the heart. The Law provides the discipline we require in mediating the demands of our earthly natures and our heaven-bound souls, so ill at ease in this world. However, study of the Law also fortifies the mind and is itself a spiritual ladder.

We may manifest our obedience to God through acts of submission expressive of fear and dread or through words of praise and glorification. External acts are significant enough to be subject to reward and punishment, but only inner devotion is truly free and sincere. The finite obligations of the Law are thus only the gateway to the open-ended obligations of the heart, the preparatory discipline for a rise typified by the infinite scope that opens in the quest for understanding, which grows 'day unto day' (Psalms 19: 3).

External duties are precisely specified; they discipline the appetites of both the many and the wise, but to follow the Law solely for the sake of a reward is tantamount to polytheism. The wisest follow God's commands for his sake, not their own; that is, they entrust their all to God, not for any gain but simply from the love of God.

The mind's persuasion is God's inspiration, Bahya argues. He illustrates this thesis by inserting a dialogue into his text in which the mind teaches the soul the nature of the obedience she owes God and shows her that philosophy can strengthen her resolve in ways that tradition cannot. Continuing their dialogue, the mind shows the soul that the conflict between free will and predestination is insoluble by reason or scriptural authority. The pious need not resolve this antinomy. They will, as their character calls upon them to do, accept full responsibility with regard to their own moral and spiritual obligations and treat all worldly outcomes as decrees of divine wisdom. Our

‘inclination’ urges just the opposite, pressing us to assume control in worldly matters (to take credit when they succeed, to feel anxiety when they hang in the balance, and to suffer regret when they fail) but to abdicate our moral and spiritual obligations by pleading the excuse of destiny, fate or nature. Pursuing a pietist stance, Bahya has here accurately pinioned much that passes for metaphysical discussion of the problem of free will (see Free will; Pietism).

The fourth virtue is reliance upon God alone. Bahya interprets this important pietist virtue as an appeal against worldliness and in behalf of peace of mind. He contrasts the pious man with the alchemist, whose Faustian desire for control drives him to hermetic studies, unending travels, and the constant worldly anxieties of *homo faber*. Mitigating the anti-causal doctrine of Islamic occasionalists, Bahya argues that natural causes are too weak to produce their effects but must be deemed to act at God’s behest (see Occasionalism). God works through nature, not despite it. So it is permissible for us to exert ourselves in our own behalf, paradigmatically, by the use of medicine. But we must constantly remember that it is God on whom we are reliant. We must keep our eye on the Source, not the instrumentality through which grace is manifested.

The fifth virtue is *ikhlas*, purity of intention. This sincerity is a material rather than a mere formal virtue; that is, sincerity here means focus on the highest ideal, direction of all our actions towards God. It is not a matter of mere faithfulness to our own intentions. The tranquillity that comes from trust, the clarity that comes to philosophical monotheism, and the perfect absence of hypocrisy that was Bahya’s original goal are all products of the virtue of *ikhlas*. It is the essence of self-rule, and thus of freedom.

The sixth virtue is humility, necessary to counter the pride that might beset even our piety. Humility manifests itself bodily in softspokenness, clemency and self-restraint. It is attained through reflection on our fragility and abjectness before God and manifested in patience, benevolence and forbearance, modesty in the face of well-founded praise, and firm demurral in the face of unfounded praise. Mastery belongs only to God, and one cannot attain any part of piety without first abandoning all claims to mastery.

The seventh virtue is penitence, a special gift from God in recognition of the inadequacy of human deeds. The key to penitence is self-knowledge; thus the eighth virtue is self-scrutiny. This, like any intellectual virtue, imposes obligations that vary in accordance with our intellectual capacities. At its lowest it means simply reflection on the wretchedness of the human body and its vile origins. At a higher level, it involves reflections on God’s grace; but ultimately it means constant, probing examination of our own intentions and the adequacy of our pursuit of the highest of them, allying ourselves firmly with others who can aid us in that pursuit.

The ninth virtue is abstemiousness (*zuhd*), a Sufi virtue and part of the legacy that all three monotheistic religions inherit from Hellenistic asceticism. All living beings, Bahya argues, need asceticism as a check upon their appetites and impulses, an inner counterpart to the economic and social discipline of the polity. Every nation has its own specialization in one or another art or science, through which it contributes to the world. Asceticism, which fosters the mind’s dominance over the entire soul, is Israel’s forte, allowing its people to overcome their powerful appetites and passions and become the spiritual physicians for the world, as it is said, ‘The fruit of the righteous is a tree of life’ (Proverbs 11: 30). Restoring the ideal of renunciation to its Platonic roots in the conception of sophrosyne, Bahya follows up on Sufi and other pietist elaborations of the ascetic ideal to find Jewish application for the notion of abstemiousness in the social sphere, through a cheerful and gentle comportment towards others; in the bodily sphere, through the discipline of the Torah’s ritual laws, with their complex system of permitted and forbidden pleasures, where we are urged to progress to the point where we regard permitted pleasures as on a par with forbidden ones (but not to the point that we harm ourselves) and in the inward or spiritual sphere, through the conquest of covetousness and worldly ambition.

The final virtue is the love of God, the summation of all that has gone before, a sincere desire to cleave to God, in gratitude, penitence and awe, pursuing a mystic intimacy attained not by ecstatic exercises but by meditations on one’s own history, on Scripture and on nature, by practice of the divine commandments, acceptance of God’s sovereignty, and living the life of the pious and abstemious. Those who truly love God will give up property, body and soul for him, as Abraham did, first by placing his worldly goods at the service of his guests, so as to draw them to God; second by undergoing circumcision; and third by his willingness to sacrifice Isaac in obedience to God’s command. The last is a superhuman piety, accessible to us only through God’s aid. Fasts and vigils are part of intimacy with God; but so are justice, neighbourly reproof and the public institution of justice, as we read in

Avot 5.18: ‘Moses was meritorious and made the many meritorious, and the merit of the many came to them through him, as it is written, ‘he worked the justice of the Lord and His righteousness with Israel’ (Deuteronomy 33: 21). That is, Moses shared in God’s attribute of justice by becoming its instrumentality in the world.

Ibn Rushd, Abu’l Walid Muhammad (1126-98)

Ibn Rushd (Averroes) is regarded by many as the most important of the Islamic philosophers. A product of twelfth-century Islamic Spain, he set out to integrate Aristotelian philosophy with Islamic thought. A common theme throughout his writings is that there is no incompatibility between religion and philosophy when both are properly understood. His contributions to philosophy took many forms, ranging from his detailed commentaries on Aristotle, his defence of philosophy against the attacks of those who condemned it as contrary to Islam and his construction of a form of Aristotelianism which cleansed it, as far as was possible at the time, of Neoplatonic influences.

His thought is genuinely creative and highly controversial, producing powerful arguments that were to puzzle his philosophical successors in the Jewish and Christian worlds. He seems to argue that there are two forms of truth, a religious form and a philosophical form, and that it does not matter if they point in different directions. He also appears to be doubtful about the possibility of personal immortality or of God’s being able to know that particular events have taken place. There is much in his work also which suggests that religion is inferior to philosophy as a means of attaining knowledge, and that the understanding of religion which ordinary believers can have is very different and impoverished when compared with that available to the philosopher.

When discussing political philosophy he advocates a leading role in the state for philosophers, and is generally disparaging of the qualities of theologians as political figures. Ibn Rushd’s philosophy is seen to be based upon a complex and original philosophy of languages which expresses his critique of the accepted methods of argument in Islamic philosophy up to his time.

1 Commentaries

Abu’l Walid Muhammad ibn Ahmad ibn Muhammad ibn Rushd, often known as Averroes (the Latinized version of his name), was born in AH 520/AD 1126 in Cordoba. He came from a distinguished line of jurists and theologians, who like him served as public officials. As a result of royal patronage he became both royal physician and *qadi* (judge) of Cordoba in succession to his father. Due to the political turmoil in Andalus (Islamic Spain) at the time, he was not always in favour, and was banished to North Africa when he was seventy during a period of persecution of philosophy. He died in AH 595/AD 1198 after having been rehabilitated, but his religious orthodoxy still seems to have been suspected by the public.

There is a famous story that when Ibn Rushd was about forty-two there was a meeting between the caliph and Ibn Rushd, at which the latter was asked to summarize the works of Aristotle in order that the ideas of that thinker might be better understood by the caliph himself, and no doubt also by the intellectual community. Ibn Rushd’s reported nervousness at accepting this commission was well-founded, since changing political circumstances had in the past - and would in the future - put Aristotle and those influenced by him under a theological cloud; the interest of a ruler in philosophy could quite easily turn into hostility. Over the next twenty-six years, however, Ibn Rushd wrote commentaries on most of Aristotle’s works. These commentaries took a variety of forms. Often he would write a summary, medium commentary and long commentary of the same text, thus presenting the ideas of Aristotle to a variety of audiences; those who were seeking a detailed discussion of the whole text would look to the long commentary, while those who wanted just to get a flavour of the original could be satisfied with the paraphrase. As Aristotle’s *Politics* was not available to him, he used Plato’s *Republic* instead for his commentary on a political text.

The remarkable feature of these commentaries is the way in which Ibn Rushd tried to get back to the original arguments of Aristotle, cleansed of the Neoplatonic accretions which had developed. This was very difficult to do, since a long and well-developed tradition of Neoplatonic commentary had very much set the agenda over the previous centuries in the Islamic world (see Neoplatonism in Islamic philosophy). However, Ibn Rushd was often able to distinguish between the points which Aristotle was trying to make and those which had been imposed upon him by the commentators. He certainly respected some of the classical commentators such as Alexander of Aphrodisias and Themistius, as well as some of the Islamic philosophers and especially his own countryman Ibn Bajja, but the style of his commentaries is to try to understand the text anew and to reconstruct the Aristotelian argument in a way which represents Aristotle’s original view. Sometimes he is more successful than at others, and

he was not averse to adding his own comments on the text when he felt this would be useful. The paraphrases are certainly a very loose summary of the originals, and often give Ibn Rushd the opportunity to express his own views on an Aristotelian theme. However, the long commentaries are very impressive analyses of the text, especially given the nature of the translations with which Ibn Rushd was working, and they came to wield great influence in the Christian and Jewish worlds (see Averroism; Averroism, Jewish.)

2 God and the world

Although Ibn Rushd did discuss theological topics in his commentaries on occasion, he usually reserved them for his more polemical works, where he has a more contemporary philosopher in mind. His *Tahafut al-tahafut (Incoherence of the Incoherence)* is a response to an earlier attack upon philosophy, the *Tahafut al-falasifa (Incoherence of the Philosophers)* written by al-Ghazali, who had argued in this work that there are two major problems with Islamic philosophy. The first problem is that it misapplies the very philosophical techniques which it advocates; that is, its arguments fall foul of the criteria for validity which philosophy itself advocates. The other problem is that the conclusions of philosophy go against the principles of Islam, which the philosophers pretend they are supporting. Al-Ghazali produced accurate descriptions of philosophical arguments and then set about demolishing them, using the same philosophical principles which his opponents try to employ. He argued that although the philosophers purport to prove that philosophy is merely a more sophisticated analysis of the nature of reality than that available to ordinary Muslims, the philosophers are in fact involved in dismantling the religious notion of God, the afterlife and creation in the guise of merely analysing these ideas. Although the object of his attack is primarily the work of al-Farabi and Ibn Sina, Ibn Rushd perceived that the whole peripatetic approach to philosophy was being challenged by al-Ghazali, and he rushed to its defence.

The nub of al-Ghazali's attack on philosophy is what he regards as its misguided interpretation of the relationship between God and the world. The Qur'an is full of references to the creation of the world and to its eventual destruction should the deity feel it appropriate, yet Islamic philosophy tends to argue that the world is eternal. If God really is an agent, al-Ghazali asks, why cannot he just create the world *ex nihilo* and then later destroy it? Ibn Rushd replies that temporal and eternal agents act very differently. We can decide to do something, we can wait for a certain time before acting, we can wonder about our future actions; but such possibilities cannot arise for God. In his case there is no gap between desire and action, nothing stands in the way of his activity; and yet we are told by al-Ghazali that God suddenly created the world. What differentiates one time from another for God? What could motivate him to create the world at one particular time as opposed to another? For us, different times are different because they have different qualitative aspects, yet before the creation of the world, when there was nothing around to characterize one time as distinct from another, there is nothing to characterize one time over another as *the* time for creation to take place (see Eternity §4).

Al-Ghazali argues that such a response is evidence of mental laziness. Even we can choose between two alternatives which appear to be identical in every respect except position. He gives the example of a hungry man being confronted by only two dates, where he is able to take just one. Since they are to all intents and purposes identical, it would seem to follow that if the philosophers are right he must just stand there and starve since there is no difference between them. Ibn Rushd criticizes this analogy, since it is not really about a choice as to which date to eat but about a choice between eating and not eating. What al-Ghazali is trying to do is establish some scope for divine action and decision-making which represents God as a real agent and not just as a cipher for natural events which would take place anyway. Ibn Rushd comments that the difficulty lies in distinguishing between the divine will and knowledge. Since an omniscient God knows exactly how the universe should be organized to produce the optimal arrangement, Ibn Rushd insists that there is no point in thinking of a gap in time existing between that conception and its instantiation. An omnipotent God does not need to wait for the appropriate moment to create the universe since nothing exists which could oblige him to wait, and he does not require time to bring about the creation. Ibn Rushd argues that given God's nature, we cannot think of his acting in any different way from that represented by the organization of the world. This does not imply a lack of freedom or ability to choose, but is merely a reflection of God's perfect nature (see Omnipotence).

Al-Ghazali followed the Ash'arites in being so concerned to emphasize the power and ubiquity of God that he refused to accept that the ordinary world really consists of stable material objects between which there are relationships of natural necessity (see Ash'ariyya and Mu'tazila §5; Causality and necessity in Islamic thought §2).

Ibn Rushd claims that this theory leads to a denial of the possibility of knowledge of the world. Since al-Ghazali accepts causality as a practical guide to our everyday lives, one might wonder what point Ibn Rushd is trying to make here. The point is that the nexus between a term and its causal properties is not merely contingent, but is really one of meaning. Al-Ghazali gives the example of a decapitated person acting just like an ordinary human being, except for the absence of a head. No such event has ever taken place, but if God wills it it could happen, because God is omnipotent and we can imagine such a possibility. If God wants to activate a headless person, he could do so. This shows that the connection between having a head and being an active human being is merely contingent, without necessity. Ibn Rushd wonders whether this change to our conceptual scheme is really possible. There are some properties which are significant aspects of the meaning of the thing of which they are the properties, and there is a necessary relationship between what a thing is and what it does. The advantage of Ibn Rushd's response is that it provides an account of how naming is possible. We can set about naming things because we can identify relatively stable entities with lawlike patterns of behaviour with other things. We may often go awry in our naming, but if we could not be sure that on the whole our names correspond with stable and fixed essences, naming itself would be an empty procedure.

Along with his insistence that the deity is a real agent, al-Ghazali was concerned to provide God with real knowledge of the everyday events of the world he created. Ibn Sina argued that God is limited to knowing only very general and abstract features of the world, since any other sort of knowledge would diminish him as an eternal and immaterial being. Al-Ghazali objects that any God which is acceptable to Islam must know the everyday events of our world. Ibn Rushd suggests that on the contrary, this would make God into someone very like his creatures and would provide him with knowledge that is beneath his dignity. God's knowledge is superior and unique because he is not limited to receiving information from the world, as is the case with finite creatures like human beings. He is the creator of the objects in the world, and he knows them in a more perfect and complete way than we can hope to attain. This suggests that God cannot know individuals as such. The best knowledge is abstract and universal, and this is the sort of knowledge which God can be thought to enjoy.

One might expect Ibn Rushd to share Ibn Sina's view that God's knowledge is limited to universal judgments, but he does not adopt this line, arguing rather that God's knowledge is neither universal nor individual, although it is more like the latter than the former. Our knowledge is the result of what God has brought about, whereas God's knowledge is produced by that which he himself has brought about, a reality which he has constructed. The organization of the universe is a reflection of God's thought, and through thinking about his own being he is at the same time thinking about the organization of the world which mirrors that essence. He cannot really be identical with contingent and accidental phenomena, yet his essence is not totally unconnected with such phenomena. They represent contingent aspects of the necessary and essential relationships which he has established. To take an example, God knows which physical laws govern the universe, but he does not need to observe any moving objects to understand the principles of movement. Such observations are only appropriate objects of knowledge of sentient creatures with sensory apparatus and are far beneath the dignity of the creator. Ibn Rushd argues that this is not to diminish God's knowledge, but rather emphasizes the distinctness of the deity from his creatures and their ways of finding things out (see God, concepts of).

3 The soul

Another charge which al-Ghazali brought against philosophy was that it fails to allow the physical resurrection of human beings and the provision of physical rewards and punishments appropriate to their behaviour during their lives. He has in mind here the Aristotelian notion of the soul, which makes the idea of an afterlife difficult to grasp. This is because the soul is the form of the living being, an aspect of the being itself, and there is no point in talking about the matter existing without the form when we are considering living creatures. Persons are combinations of soul and body, and in the absence of the latter there are no persons left (see Soul in Islamic philosophy).

Ibn Rushd appears to argue that as we become more involved with immortal and eternal knowledge, and with universal and abstract principles, our mind becomes identical to a degree with those objects of knowledge. So, once we have perfected ourselves intellectually and know everything that there is to know about the formal structure of reality, there is no longer really any 'us' around to do the knowing. Ibn Rushd regards our progress in knowledge as equivalent to a lessening of our ties with our material and individual human characteristics, with the

radical result that if anything survives death, it must be the species and not the individual. Temporal and finite creatures are destructible, but as members of a species we are permanent, although only the species itself is entirely free from destruction.

This seems even more incompatible with the traditional religious view of the afterlife than the position which al-Ghazali attacks. Ibn Rushd follows this with a political account of the function of the religious language, describing the afterlife as providing ordinary believers with a motive for virtuous action and dissuading them from immorality. He does not entirely rule out the possibility of the sort of physical afterlife on which al-Ghazali insists, but it is clear from his work that he regards such a possibility as wildly unlikely. The only meaning which can be given to such a notion is political, and there is nothing irreligious about such an interpretation, according to Ibn Rushd. It is difficult for unsophisticated believers to understand that it is worthwhile to act well and avoid evil, or that their actions have a wider reference than the immediate community of acquaintances, so any religion which is able to motivate them must address them in ways that they comprehend and in a language which strikes an emotional chord. Richly descriptive accounts of the afterlife, of God seeing everything which happens and of his creation of the world out of nothing, help adherence by the majority to the principles of religion and are the only sort of language which most members of the community can understand. The arguments which Ibn Rushd presents for hedging in the notion of the immortality of the individual soul would not mean much to the unsophisticated believer, while the more intellectually alert are expected by Ibn Rushd to understand how that notion fits in with the basic principles of Islam.

4 Moral and political philosophy

Ibn Rushd presents a firm critique of the Ash'arite theory of moral language, which interprets rightness and wrongness entirely in conformity with the commands of God. The purpose of that theory is to emphasize the power and authority of the deity over everything, even over the meaning of ethical terms (see Ethics in Islamic philosophy). What we ought to do then is simply equivalent to God's commands, and we ought to do it because God has commanded it, so that everything we need to know about moral behaviour is encapsulated in Islam. Ibn Rushd argued that on the contrary, a distinction should be drawn between moral notions and divine commands. Here he follows an Aristotelian approach. Since everything has a nature, and this nature defines its end, we as things also have natures and ends at which our behaviour is directed. The purpose of a plant is to grow and the aim of a saw is to cut, but what is the purpose of a human being? One of our ultimate aims is to be happy and to avoid actions which lead to unhappiness. It is not difficult here to align Islamic and Aristotelian principles: moral virtue leads to happiness since, if we do what we should in accordance with our nature, we will be able to achieve happiness. This happiness may be interpreted in a number of ways, either as a mixture of social and religious activities or as an entirely intellectual ideal. However, the latter is possible only for a very few, and neither religion nor philosophy would approve of it as the ultimate aim for the majority of the community. There is an essential social dimension to human happiness which makes the identification of happiness with correct moral and religious behaviour much easier to establish. It is conceivable that someone would try to live completely apart from the community to concentrate upon entirely intellectual pursuits, but this way of living is inferior to a life in which there is a concentration upon intellectual thought combined with integration within the practices of a particular society.

One might expect that a thinker such as Ibn Rushd, who was working within an Islamic context, would identify happiness and misery with some aspect of the afterlife, but as we have seen, he was unable to accept the traditional view of the afterlife as containing surviving individuals like ourselves. What the notion of the afterlife is supposed to achieve is an understanding that the scope of personal action is wider than might immediately appear to be the case. Without religious language and imagery, ordinary believers may find it difficult to grasp that our moral actions affect not only ourselves but the happiness of the whole community, not just at a particular time or in a particular place but as a species. When we behave badly we damage our own chances of human flourishing, and this affects our personal opportunities for achieving happiness and growing as people. It also affects our relationships with other people, resulting in a weakening of society. While it is possibly true that the misery consequent upon evil-doing may not follow us personally after our death, it may well follow the community. The importance of the notion of an afterlife is that it points to the wider terms of reference in which moral action has life.

In his commentary on Plato's *Republic*, Ibn Rushd modifies Plato in terms of his own Aristotelian views and applies the text to the contemporary state. He uses Plato's idea of the transformation and deterioration of the ideal state into four imperfect states to illustrate aspects of past and contemporary political organization in the Islamic world (see Political philosophy in classical Islam). He takes mischievous pleasure in comparing the theologians of his own time, the *mutakallimun*, to Plato's sophists (see Islamic theology §2). He describes the theologians as a genuine danger to the state and to the purity of Islam, and suggests to the ruler that a ban on the publicizing of their activities is advisable. In this and many of his other works, Ibn Rushd stresses the importance of a careful understanding of the relationship between religion and philosophy in the state. Revelation is superior to philosophy in that it makes its message more widely available than is possible for philosophy. The prophet can do things which the philosopher cannot, such as teaching the masses, understanding the future, establishing religious laws and contributing to the happiness of the whole of humanity. Through divine revelation or inspiration, the prophet establishes laws which make it possible for people to attain an understanding of how they should behave. The credentials of the prophet are to be established by political skill. Miracles are irrelevant here; only legislative abilities count.

The philosopher has all the theoretical knowledge which the prophet has, but only the latter can embody this knowledge in a law and persuade the general public that this is a law which must be obeyed (see Law, Islamic philosophy of). What the prophet has is practical knowledge as well as the theoretical knowledge which he shares with the philosopher, and so the content of the prophetic law (*shari'a*) is no different from the content of the philosophical law (*namus*). The prophet is much better at putting this content across to the community, and can transform abstract ideas about human happiness into political ideas and social norms which then are capable of regulating the life of the community. However, it is worth emphasizing that the only advantage which religion has over reason is that the former involves a practical form of knowledge which is not necessarily possessed by the latter. The issue of the relationship between philosophy and religion fascinated the Islamic philosophers (see Epistemology in Islamic philosophy §5), and Ibn Rushd was no exception in this respect. He tried to refine this issue time and time again throughout his works.

5 The role of philosophy

The role of the philosopher in the state was a topic of continual interest for Ibn Rushd. He noticed that Aristotle (§26) seemed to hesitate between the view that the prime constituent of the good life is intellectual thought and the alternative, based upon a broader collection of virtues. These two alternatives have very different implications, especially within the context of a religious philosophy. The identification of a more social notion of happiness as living in accordance with a general mixture of virtues would make happiness more generally available to the public, since it would mean that the unsophisticated but dutiful believer could achieve a high level of perfection in their life. The idea that intellectual excellence is the highest form of human wellbeing or happiness implies that the great majority of the community, unable or disinclined to concentrate completely on intellectual issues, is thereby deprived of the very best form of life. No religion such as Islam with its claims to universality could tolerate such a confining restriction on human happiness. Ibn Rushd thinks he can avoid this dilemma. The basis to his solution is the argument that religion and philosophy are not incompatible. Islam is a rational system of beliefs and it requires its adherents to attend to rational arguments concerning how they are to behave and think. The rational arguments are there in the Qur'an and other places for those who can follow them, and for those who cannot there are other forms of presentation of the truth which are easier to understand.

This might seem a patronizing way to describe the faith of the ordinary believer, but Ibn Rushd suggests that if we look at examples from law and medicine we shall see how acceptable it is. Lawyers may study in detail the principles behind legislation, yet most of the community just follows the law without thinking deeply about its rationale. Those who work in medical fields have a good understanding of how the body works and how different forms of treatment affect the health of the individual. The ordinary person does not understand much of this, and just goes along with what they are told by the medical experts. There is nothing wrong with this; there is no necessity for everyone in the community to be either a lawyer or a doctor. Different people have different attitudes to both the law and medicine, some based upon real understanding and some based upon casual acquaintance, and these differences do not interfere with the ability of everyone in the community to live in an organized and healthy society.

Any religion with claims to general acceptability must present its message in a suitable form for the particular audience it is addressing. Ibn Rushd argues that Islam is an especially excellent religion because it has the ability to present the important issues to the greatest variety of people. Some people will be attracted to Islam and strengthened in their faith if the philosophical arguments for being a Muslim are pursued and developed. Others, perhaps the majority, cannot really understand such arguments but can understand simpler arguments and parables which describe in simple terms what is wrong with other religions and why Islam is superior to them. Still others will not even be able to grasp such simple arguments and so must be persuaded by rhetorical devices, which include a grain of logical force but mainly consist of persuasive imagery and exhortation. The way in which Ibn Rushd makes this distinction has led some commentators to think that his real view is that philosophy alone reveals the truth, and religion is only suitable for the intellectually weak who have to be satisfied with stories and doctrines which are, strictly speaking, false. Such a disingenuous interpretation is not required, however. Ibn Rushd is trying to highlight the fact that there are a variety of ways of coming to know something, some of which are surer than others, but all of which are acceptable. Once the object of knowledge is acquired then it is known, however that knowledge has been achieved. We know religious truths in different ways, but we really do know exactly the same thing.

One of the excellences of Islam, according to Ibn Rushd, is its accessibility to a wide range of adherents. In many of his works, and especially in his *Fasl al-maqal (Decisive Treatise)*, he argues that the highest form of demonstrative reasoning cannot clash with the principles of religion. He claims here that philosophers are best able to understand properly the allegorical passages in the Qur'an on the basis of their logical training, and that there is no religious stipulation that all such passages have to be interpreted literally. Where demonstrative reasoning appears to conflict with the sense of Scripture, then those capable of demonstration (the philosophers) know that the passages must be interpreted allegorically so as to cohere with the demonstrative truths. Philosophers should be careful when they do this not to offend the religious sensibilities of the less sophisticated, in sharp contrast with the practice of the theologians. The latter frequently interpret such passages so crudely that they either throw doubt on religion itself, or threaten the pursuit of philosophy by raising doubts in people's minds concerning the orthodoxy of the conclusions reached by the philosophers. Language should be seen as a sophisticated vehicle for communicating information to different categories of audience. Religion is a means for the easy comprehension of the majority of the people, and where a hidden meaning exists it is up to the philosophers to discover it and keep it to themselves, while the rest of the community must accept the literalness of Scripture.

6 Philosophy of language

Ibn Rushd is in a difficult position when trying to respond to al-Ghazali's attacks upon philosophy, since the former tried at the same time to distance himself from the sort of Neoplatonic approach to theoretical issues which Ibn Sina advocated, and it was Ibn Sina who was the direct object of al-Ghazali's critique. One of the most significant methodological disputes between Ibn Rushd and Ibn Sina lies in their differing analyses of the relationship between essence and existence, and this has an important influence upon Ibn Rushd's approach to meaning. Ibn Sina held that a state of affairs is possible if and only if something else acts to bring it into existence, with the sole exception of the deity. Ibn Rushd characterizes this view, quite correctly, as one in which possible states of affairs are nonexistent in themselves, until their existence is brought about by some cause. The possible is that whose essence does not include its existence and so must depend upon a cause which makes its actuality necessary, but only necessary relative to that cause. In this modal system there are really only two kinds of being, that necessary through another and that necessary in itself (that is, God), so that the realm of the possible becomes identical with both the actual and the necessary.

Both Ibn Rushd and Ibn Sina maintain that there is a logical distinction between essence and existence, but the former accuses the latter of conflating the order of thought with the order of things, the logical order with the ontological order. Ibn Sina does indeed start with the logical distinction between essence and existence and then proceeds via his theory of emanation to show how existence comes to essence from the necessarily acting Necessary Being (see Neoplatonism in Islamic philosophy §3). The occasionalism of al-Ghazali is like the theory of emanation of Ibn Sina, in that both doctrines interpret the contingent world as radically dependent upon something else. The account of essence and existence provided by Ibn Sina is perfectly acceptable to al-Ghazali, with the proviso that direct divine intervention is required to bring existence to the essences. Ibn Sina divides up the world into existing things and essences, into what we can think about and what really exists, and into things

which are necessary through another and are possible in themselves. These distinctions throw doubt on the sort of realism and emphasis upon substance that is so important for Ibn Rushd and his form of Aristotelianism. This latter is based upon a model of the world as one entity, as a single order of nature with no impenetrable barriers to human understanding and investigation. This leads Ibn Rushd to argue that although a logical distinction can be drawn between the existence and essence of a thing, there is nonetheless a necessary relationship between existence and essence. Without such a relationship, one could conceive of all sorts of things happening to essences without regard to how they are actually instantiated - the sorts of thought-experiments which al-Ghazali advocates - which Ibn Rushd argues seriously misrepresents the nature of philosophy. The meaning of the name of a thing is intimately connected with the way in which it is instantiated, and it is a radical error in the philosophy of language to separate essence and existence (see Existence; Meaning in Islamic philosophy §3).

To understand Ibn Rushd's account of a variety of paths to the truth, we have to grasp his theory of meaning. He emphasizes the importance of notions such as equivocation and ambiguity in language because he thinks it is important to be able to explain how names can be used in similar ways in different contexts. Ibn Rushd agrees with Aristotle that there can be no priority or posteriority within the same genus, and so he develops an account of meaning which is based upon the *pros hen* rather than the genus-species relation. If the latter were used, meaning would come out as univocal and al-Ghazali would be entirely justified in expecting the philosophers to account for God and his activity in the same sort of language as we use to describe ourselves. If meaning is expressed in terms of *pros hen* equivocals (*bi nisba ila shay' wahid*), then we can look for some similarity in the objects which form the basis to the sharing of the name, but we do not have to insist that exactly the same name be used in its different contexts with precisely the same meaning. We can also insist that the different contexts in which a name is used have to be taken into account when we come to ask for the meaning of the name. For al-Ghazali, abstract terms have a meaning which is independent of their reference in the external world. The meaning of such terms is equivalent to the series of pictures or images in which the events they describe are characterized in particular ways. All that we have to do to conceive of God miraculously creating something out of nothing is to imagine it happening, and so it is possible. Ibn Rushd argues that, on the contrary, it is not enough to have a series of images in one's mind to establish the meaningfulness of that combination of images. A meaningful use of language is possible only through the connection of linguistic terms and ideas with a framework in which they make sense, and such a framework is connected to the varying uses of the terms and to the way in which the world is.

The concept which Ibn Rushd wants his account of language to characterize is that of a point of view. In Ibn Rushd's thought there is a continual contrast between different points of view, not just a distinction between God's point of view and the human point of view, but also a differentiation of the standpoints of the whole of humanity based upon their forms of reasoning. For example, in the *Fasl al-maqal* he talks about demonstrative, dialectical, rhetorical and sophistical people, all of whom are using similar language to discuss what is important to them, namely their faith, morality, the next life and so on. This language is not identical regardless of the way in which it is used, nor is it completely equivocal. There are connections between different applications of the same name, and these connections are strong enough for it to make sense to say that these uses are of the same name; so we can talk about there being a variety of routes to the same destination, a variety of views based upon the same ideas and beliefs, and a variety of ways of living which together add up to a morally and religiously desirable form of life.

Ibn Rushd extends the use of the notion of *ijma'* (consensus) from its theological role of establishing what is acceptable within Islam to an even more important role, that of establishing what words mean. If there is agreement in the community that particular scriptural passages are clear, then they are clear and that is the end of the matter. If it is felt by some that there is ambiguity in some passages, then there is ambiguity which has to be resolved in some way if practice is not to suffer. Those who feel that there is ambiguity have to try to resolve that ambiguity in a way which enables them to follow the route to salvation. They must do this without challenging the views of the rest of the community, since to do so would threaten the ordinary meanings of the terms which are being used. Ibn Rushd suggests that if the theologians publicize their confused thoughts about the meaning of the Qur'an, ordinary believers would doubt that they understood the texts they originally thought they knew. If doctors were to do this sort of thing, then their patients would come to think that there is no such thing as health and illness.

Ibn Rushd argues that we know from our everyday experience that there exists health and illness, and that religious texts contain important information as to how we should behave. We also have to pay attention to the different

ways in which different people relate to these facts. There exists a whole variety of different views on a particular issue, and this variety of views is represented by the variety of language which is available to describe this continuum of views, ranging from the entirely demonstrative to the purely poetic and expressive. Equivocation in language is not something to be challenged; rather it is to be accepted, since it represents a feature of our lives as different people living in a community with a whole range of ends and purposes. We should respect the different uses of the same word because they represent different points of view, different perspectives on the same thing. When Ibn Rushd tries to reconcile apparently contradictory views his approach is to argue that all these views are acceptable as different aspects of one thing. Throughout his philosophy he tries to show how it is possible for one thing to be described in a variety of ways.

Ibn Sab'in, Muhammad ibn 'Abd al-Haqq (1217-68)

Ibn Sab'in is well-known in Islamic philosophy for presenting perhaps the most radical form of Sufism. He argued that everything is really just one thing, part of the deity, and that breaking up reality into different units is to deny the nature of creation. He was hostile as a result to the attempts of the philosophers who were inspired by Aristotle to develop logic as a means to understand reality. The best way to attain the truth is the mystical path, and this is achieved by appreciating the unity of everything, not by analysing reality into separable concepts.

Ibn Sab'in came from Murcia (southeast Spain) and embraced the same type of philosophical thinking and writing as the main mystic of the twelfth century, Ibn al-'Arabi. Ibn Sab'in moved to Mecca after the year AH 642/AD 1245, where he remained until he put an end to his life. His pre-eminence in Sufi circles won him the title 'Qutb ad-Din' (the Pole of Religion). He belongs to a school of Sufism which views existence, both in its divine and worldly forms, as one indivisible unit. An important work is *Asrar al-hikma al-mashriqiyya (The Secrets of Illuminationist Philosophy)*. The most important source of Ibn Sab'in's philosophy, however, is his book *Budd al-'arif (Escape of the Gnostic)* which deals with the path to knowledge, which he wrote in AH 643/AD 1245 after moving from Spain to Morocco. In this book, Ibn Sab'in poses the fundamental question of how a Sufi can reach truth and prepare for the reception and comprehension of divine perfection. In answering these questions, he discusses the opinions of the philosophical schools that preceded him, proving the inability of those schools to reach the truth.

In his writings, Ibn Sab'in attempted to enter the realm of Sufism by way of philosophy, explaining in his presentation of the history of Islamic thought that such disciplines as philology, scholastic theology (*kalam*) and philosophy are but milestones along the Sufi's path to perfection. Thus the discipline of the Sufi who has achieved perfection is the essence of all the other disciplines. In his attempt to determine the manner in which a Sufi attains unity with God, Ibn Sab'in examines the manner in which a person achieves knowledge. By knowledge, he means the discipline of logic and the ability of such a discipline to help one to achieve divine knowledge (see Logic in Islamic philosophy). He then deals with a host of concepts with a special focus on the 'intellect' and the 'self' as being the tools for achieving knowledge and as having a primary role in bringing the Sufi closer to God. Ibn Sab'in is close to most Muslim Sufi thinkers in their initial emphasis on other disciplines that a Sufi should master, particularly logic. He differs from them, however, in his conclusions about the role of logic. Whereas most philosophers, particularly the Aristotelians, view logic as a tool which helps us to know the world and which founds the theory of knowledge (see Aristotelianism in Islamic philosophy), Ibn Sab'in views the role of logic as being random and worthless, since for him knowledge is only knowledge of God. Such knowledge is subject in its meaning to one consideration, a consideration of the internal experience based on our stimulation and sensations, sensations with standards and bases superior to the standards and methods of logic.

Since according to Ibn Sab'in the unity of existence is the criterion for understanding existence, examination of the various phenomena in existence would be incompatible with such unity and hence would mean the postulation of the idea of a God superior to and separate from his creations. In Ibn Sab'in's concept of absolute unity of existence, following that of Ibn al-'Arabi, the separation of God from his creation is inadmissible. He presents the 'intellect' and the 'self' as the means which lead us to the divine Being. In this theory, Ibn Sab'in is critical of his predecessors who viewed the mind or intellect as no more than a means for the acquisition of knowledge; he views the intellect as being of divine origin. His defence of this theory is based on the Prophetic *hadith* (tradition) that 'the first thing God created was the intellect; God then told it to come forward which it did, and then told it to go away which it also did.' Ibn Sab'in's attempt to demonstrate the possibility of the intellect contacting the divine is based on this relationship, namely that the intellect is a divine creation and as such the mind can directly and without any mediation communicate with its origin. The philosophers' attempt to reach a higher level of knowledge through making contact with the active intellect is a less ambitious attempt than that of the Sufis, who make unity with God their chief concern.

Like the intellect, the self is not merely a means by which perception takes place but should rather be perceived as a goal in itself, a goal which constitutes the knowledge that the Sufi seeks. In Ibn Sab'in's theory the self, like the intellect, is a divine creation. The path that leads to unification with God, then, is based on the discovery of the self or, more correctly, discovery of the secret which God has entrusted to us. Unification with God is thus an internal

experience which does not follow the philosophers’ accounts. For whereas the philosophers saw the path to God as a matter of proof, Ibn Sab‘in saw such a path as a matter of experience based on a particular discovery through which the truth becomes evident, so that the Sufi feels that God is closer to him than his own jugular vein.

Ibn Sina, Abu ‘Ali al-Husayn (980-1037)

Ibn Sina (Avicenna) is one of the foremost philosophers in the Medieval Hellenistic Islamic tradition that also includes al-Farabi and Ibn Rushd. His philosophical theory is a comprehensive, detailed and rationalistic account of the nature of God and Being, in which he finds a systematic place for the corporeal world, spirit, insight, and the varieties of logical thought including dialectic, rhetoric and poetry.

Central to Ibn Sina’s philosophy is his concept of reality and reasoning. Reason, in his scheme, can allow progress through various levels of understanding and can finally lead to God, the ultimate truth. He stresses the importance of gaining knowledge, and develops a theory of knowledge based on four faculties: sense perception, retention, imagination and estimation. Imagination has the principal role in intellection, as it can compare and construct images which give it access to universals. Again the ultimate object of knowledge is God, the pure intellect.

In metaphysics, Ibn Sina makes a distinction between essence and existence; essence considers only the nature of things, and should be considered apart from their mental and physical realization. This distinction applies to all things except God, whom Ibn Sina identifies as the first cause and therefore both essence and existence. He also argued that the soul is incorporeal and cannot be destroyed. The soul, in his view, is an agent with choice in this world between good and evil, which in turn leads to reward or punishment.

Reference has sometimes been made to Ibn Sina’s supposed mysticism, but this would appear to be based on a misreading by Western philosophers of parts of his work. As one of the most important practitioners of philosophy, Ibn Sina exercised a strong influence over both other Islamic philosophers and medieval Europe. His work was one of the main targets of al-Ghazali’s attack on Hellenistic influences in Islam. In Latin translations, his works influenced many Christian philosophers, most notably Thomas Aquinas.

1 Biography

Ibn Sina was born in AH 370/AD 980 near Bukhara in Central Asia, where his father governed a village in one of the royal estates. At thirteen, Ibn Sina began a study of medicine that resulted in ‘distinguished physicians… reading the science of medicine under [him]’ (Sirat al-shaykh al-ra’is (The Life of Ibn Sina): 27). His medical expertise brought him to the attention of the Sultan of Bukhara, Nuh ibn Mansur, whom he treated successfully; as a result he was given permission to use the sultan’s library and its rare manuscripts, allowing him to continue his research into modes of knowledge.

When the sultan died, the heir to the throne, ‘Ali ibn Shams al-Dawla, asked Ibn Sina to continue as vizier, but the philosopher was negotiating to join the forces of another son of the late king, Ala al-Dawla, and so went into hiding. During this time he composed his major philosophical treatise, *Kitab al-shifa’ (Book of Healing)*, a comprehensive account of learning that ranges from logic and mathematics to metaphysics and the afterlife. While he was writing the section on logic Ibn Sina was arrested and imprisoned, but he escaped to Isfahan, disguised as a Sufi, and joined Ala al-Dawla. While in the service of the latter he completed *al-Shifa’* and produced the *Kitab al-najat (Book of Salvation)*, an abridgment of *al-Shifa’*. He also produced at least two major works on logic: one, *al-Mantiq*, translated as *The Propositional Logic of Ibn Sina*, was a commentary on Aristotle’s *Prior Analytics* and forms part of *al-Shifa’*; the other, *al-Isharat wa-’l-tanbihat (Remarks and Admonitions)*, seems to be written in the ‘indicative mode’, where the reader must participate by working out the steps leading from the stated premises to proposed conclusions. He also produced a treatise on definitions and a summary of the theoretical sciences, together with a number of psychological, religious and other works; the latter include works on astronomy, medicine, philology and zoology, as well as poems and an allegorical work, *Hayy ibn Yaqzan (The Living Son of the Vigilant)*. His biographer also mentions numerous short works on logic and metaphysics, and a book on ‘Fair Judgment’ that was lost when his prince’s fortunes suffered a turn. Ibn Sina’s philosophical and medical work and his political involvement continued until his death.

2 Reason and reality

Ibn Sina’s autobiography parallels his allegorical work, *Hayy ibn Yaqzan*. Both clarify how it is possible for individuals by themselves to arrive at the ultimate truths about reality, being and God. The autobiography shows

how Ibn Sina more or less taught himself, although with particular kinds of help at significant moments, and proceeded through various levels of sophistication until he arrived at ultimate truths.

Such progress was possible because of Ibn Sina’s conception of reality and reasoning. He maintains that God, the principle of all existence, is pure intellect, from whom other existing things such as minds, bodies and other objects all emanate, and therefore to whom they are all necessarily related. That necessity, once it is fully understood, is rational and allows existents to be inferred from each other and, ultimately, from God. In effect, the totality of intelligibles is structured syllogistically and human knowledge consists of the mind’s reception and grasp of intelligible being. Since knowledge consists of grasping syllogistically structured intelligibles, it requires the use of reasoning to follow the relations between intelligibles. Among these intelligibles are first principles that include both concepts such as ‘the existent’, ‘the thing’ and ‘the necessary’, that make up the categories, and the truths of logic, including the first-figure syllogistics, all of which are basic, primitive and obvious. They cannot be explained further since all explanation and thought proceeds only on their basis. The rules of logic are also crucial to human development.

Ibn Sina’s stand on the fundamental nature of categorical concepts and logical forms follows central features of Aristotle’s thought in the *Prior Analytics* (see Aristotle §§4-7). Borrowing from Aristotle, he also singles out a capacity for a mental act in which the knower spontaneously hits upon the middle term of a syllogism. Since rational arguments proceed syllogistically, the ability to hit upon the middle term is the ability to move an argument forward by seeing how given premises yield appropriate conclusions. It allows the person possessing this ability to develop arguments, to recognize the inferential relations between syllogisms. Moreover, since reality is structured syllogistically, the ability to hit upon the middle term and to develop arguments is crucial to moving knowledge of reality forward.

Ibn Sina holds that it is important to gain knowledge. Grasp of the intelligibles determines the fate of the rational soul in the hereafter, and therefore is crucial to human activity. When the human intellect grasps these intelligibles it comes into contact with the Active Intellect, a level of being that emanates ultimately from God, and receives a ‘divine effluence’. People may be ordered according to their capacity for gaining knowledge, and thus by their possession and development of the capacity for hitting on the middle term. At the highest point is the prophet, who knows the intelligibles all at once, or nearly so. He has a pure rational soul and can know the intelligibles in their proper syllogistic order, including their middle terms. At the other end lies the impure person lacking in the capacity for developing arguments. Most people are in between these extremes, but they may improve their capacity for grasping the middle term by developing a balanced temperament and purity of soul (see Logic in Islamic philosophy §1).

In relation to the older debate about the respective scopes of grammar and logic, Ibn Sina argues that since logic deals with concepts that can be abstracted from sensible material, it also escapes the contingencies of the latter. Language and grammar govern sensible material and therefore have a different domain; indeed, languages are various and their rules of operation, their grasp of sensible material, are likewise articulated variously (see Language, philosophy of). Nevertheless, languages make available the abstracted concepts whose operation is governed by logic; yet if language deals with contingencies, it is not clear how it can grasp or make available the objects of logic. At times, as for example in *al-Isharat*, Ibn Sina suggests that languages generally share a structure.

3 Theory of knowledge

In his theory of knowledge, Ibn Sina identifies the mental faculties of the soul in terms of their epistemological function. As the discussion of logic in §2 has already suggested, knowledge begins with abstraction. Sense perception, being already mental, is the form of the object perceived (see Sense and reference §1). Sense perception responds to the particular with its given form and material accidents. As a mental event, being a perception of an object rather than the object itself, perception occurs in the particular. To analyse this response, classifying its formal features in abstraction from material accidents, we must both retain the images given by sensation and also manipulate them by disconnecting parts and aligning them according to their formal and other properties. However, retention and manipulation are distinct epistemological functions, and cannot depend on the same psychological faculty; therefore Ibn Sina distinguishes faculties of relation and manipulation as appropriate to those diverse epistemological functions (see Epistemology in Islamic philosophy §4).

Ibn Sina identifies the retentive faculty as 'representation' and charges the imagination with the task of reproducing and manipulating images. To conceptualize our experience and to order it according to its qualities, we must have and be able to reinvoke images of what we experienced but is now absent. For this we need sensation and representation at least; in addition, to order and classify the content of representation, we must be able to discriminate, separate out and recombine parts of images, and therefore must possess imagination and reason. To think about a black flag we must be able to analyse its colour, separating this quality from others, or its part in the image from other images, and classify it with other black things, thereby showing that the concept of black applies to all such objects and their images. Imagination carries out this manipulation, allowing us to produce images of objects we have not seen in fact out of the images of things we have experienced, and thereby also generating images for intelligibles and prophecies.

Beyond sense perception, retention and imagination, Ibn Sina locates estimation (*wahm*). This is a faculty for perceiving non-sensible 'intentions that exist in the individual sensible objects'. A sheep flees a wolf because it estimates that the animal may do it harm; this estimation is more than representation and imagination, since it includes an intention that is additional to the perceived and abstracted form and concept of the animal. Finally, there may be a faculty that retains the content of *wahm*, the meanings of images. Ibn Sina also relies on a faculty of common sense, involving awareness of the work and products of all the other faculties, which interrelates these features.

Of these faculties, imagination has a principal role in intellection. Its comparison and construction of images with given meanings gives it access to universals in that it is able to think of the universal by manipulating images (see Universals). However, Ibn Sina explains this process of grasping the universal, this emergence of the universal in the human mind, as the result of an action on the mind by the Active Intellect. This intellect is the last of ten cosmic intellects that stand below God. In other words, the manipulation of images does not by itself procure a grasp of universals so much as train the mind to think the universals when they are given to the mind by the Active Intellect. Once achieved, the processes undergone in training inform the mind so that the latter can attend directly to the Active Intellect when required. Such direct access is crucial since the soul lacks any faculty for retaining universals and therefore repeatedly needs fresh access to the Active Intellect.

As the highest point above the Active Intellect, God, the pure intellect, is also the highest object of human knowledge. All sense experience, logic and the faculties of the human soul are therefore directed at grasping the fundamental structure of reality as it emanates from that source and, through various levels of being down to the Active Intellect, becomes available to human thought through reason or, in the case of prophets, intuition. By this conception, then, there is a close relation between logic, thought, experience, the grasp of the ultimate structure of reality and an understanding of God. As the highest and purest intellect, God is the source of all the existent things in the world. The latter emanate from that pure high intellect, and they are ordered according to a necessity that we can grasp by the use of rational conceptual thought (see Neoplatonism in Islamic philosophy). These interconnections become clearer in Ibn Sina's metaphysics.

4 Metaphysics

Metaphysics examines existence as such, 'absolute existence' (*al-wujud al-mutlaq*) or existence so far as it exists. Ibn Sina relies on the one hand on the distinction in Aristotle's *Prior Analytics* between the principles basic to a scientific or mathematical grasp of the world, including the four causes, and on the other hand the subject of metaphysics, the prime or ultimate cause of all things - God. In relation to the first issue, Ibn Sina recognizes that observation of regularities in nature fails to establish their necessity. At best it evinces the existence of a relation of concomitance between events. To establish the necessity implicated in causality, we must recognize that merely accidental regularities would be unlikely to occur always, or even at all, and certainly not with the regularity that events can exhibit (see Causality and necessity in Islamic thought). Thus, we may expect that such regularities must be the necessary result of the essential properties of the objects in question.

In developing this distinction between the principles and subject of metaphysics, Ibn Sina makes another distinction between essence and existence, one that applies to everything except God. Essence and existence are distinct in that we cannot infer from the essence of something that it must exist (see Existence). Essence considers only the nature of things, and while this may be realized in particular real circumstances or as an item in the mind

with its attendant conditions, nevertheless essence can be considered for itself apart from that mental and physical realization. Essences exist in supra-human intelligences and also in the human mind. Further, if essence is distinct from existence in the way Ibn Sina is proposing, then both the existence and the non-existence of the essence may occur, and each may call for explanation.

5 The existence of God

The above distinctions enter into the central subject matter of metaphysics, that is, God and the proof of his existence. Scholars propose that the most detailed and comprehensive of Ibn Sina’s arguments for God’s existence occurs in the ‘Metaphysics’ section of *al-Shifa’* (Gutas 1988; Mamura 1962; Morewedge 1972). We know from the *Categories* of Aristotle that existence is either necessary or possible. If an existence were only possible, then we could argue that it would presuppose a necessary existence, for as a merely possible existence, it need not have existed and would need some additional factor to bring about its existence rather than its non-existence. That is, the possible existence, in order to be existent, must have been necessitated by something else. Yet that something else cannot be another merely possible existence since the latter would itself stand in need of some other necessitation in order to bring it about, or would lead to an infinite regress without explaining why the merely possible existence does exist. From this point, Ibn Sina proposes that an essential cause and its effect will coexist and cannot be part of an infinite chain; the nexus of causes and effects must have a first cause, which exists necessarily for itself: God (see God, arguments for the existence of §1).

From his proof of God’s existence, Ibn Sina goes on to explain how the world and its order emanates from God. Whereas Aristotle (§16) himself did not relate the Active Intellect that may be implied in *On the Soul* III with the first, ever-thinking cause of the universal found in Book XII of his Metaphysics, later commentators on his work (for example, Alexander of Aphrodisias) identified the two, making the Active Intellect, the principle that brings about the passage of the human intellect from possibility to actuality, into the first cause of the universe. Together with this is the proof of God’s existence that sees him not only as the prime mover but also as the first existent. God’s self-knowledge consist in an eternal act that results in or brings about a first intelligence or awareness. This first intelligence conceives or cognizes the necessity of God’s existence, the necessity of its own existence, and its own existence as possible. From these acts of conception, other existents arise: another intelligence, a celestial soul and a celestial body, respectively. The last constitutes the first sphere of the universe, and when the second intelligence engages in its own cognitive act, it constitutes the level of fixed stars as well as another level of intelligence that, in turn, produces another intelligence and another level of body. The last such intelligence that emanates from the successive acts of knowing is the Active Intellect, that produces our world. Such emanation cannot continue indefinitely; although being may proceed from intelligence, not every intelligence containing the same aspects will produce the same effects. Successive intelligences have diminished power, and the active intellect, standing tenth in the hierarchy, no longer possesses the power to emanate eternal beings.

None of these proposals by Ibn Sina give grounds for supposing that he was committed to mysticism (for an opposing view, see Mystical philosophy in Islam §1). His so called ‘Eastern philosophy’, usually understood to contain his mystical doctrines, seems to be an entirely Western invention that over the last two hundred years has been read into Ibn Sina’s work (see Gutas 1988). Nevertheless, Ibn Sina combines his Aristotelianism with a religious interest, seeking to explain prophecy as having its basis in a direct openness of the prophet’s mind to the Active Intellect, through which the middle terms of syllogisms, the syllogisms themselves and their conclusions become available without the procedure of working out proofs. Sometimes the prophet gains insight through imagination, and expresses his insight in figurative terms. It is also possible for the imagination to gain contact with the souls of the higher spheres, allowing the prophet to envisage the future in some figurative form. There may also be other varieties of prophecy.

6 The soul

In all these dealings with prophecy, knowledge and metaphysics, Ibn Sina takes it that the entity involved is the human soul. In *al-Shifa’*, he proposes that the soul must be an incorporeal substance because intellectual thoughts themselves are indivisible. Presumably he means that a coherent thought, involving concepts in some determinate order, cannot be had in parts by different intellects and still remain a single coherent thought. In order to be a coherent single unity, a coherent thought must be had by a single, unified intellect rather than, for example, one intellect having one part of the thought, another soul a separate part of the thought and yet a third intellect having a

third distinct part of the same thought. In other words, a coherent thought is indivisible and can be present as such only to an intellect that is similarly unified or indivisible. However, corporeal matter is divisible; therefore the indivisible intellect that is necessary for coherent thought cannot be corporeal. It must therefore be incorporeal, since those are the only two available possibilities.

For Ibn Sina, that the soul is incorporeal implies also that it must be immortal: the decay and destruction of the body does not affect the soul. There are basically three relations to the corporeal body that might also threaten the soul but, Ibn Sina proposes, none of these relations holds true of the incorporeal soul, which therefore must be immortal. If the body were a cause of the soul's existence, or if body and soul depended on each other necessarily for their existence, or if the soul logically depended on the body, then the destruction or decay of the body would determine the existence of the soul. However, the body is not a cause of the soul in any of the four senses of cause; both are substances, corporeal and incorporeal, and therefore as substances they must be independent of each other; and the body changes and decays as a result of its independent causes and substances, not because of changes in the soul, and therefore it does not follow that any change in the body, including death, must determine the existence of the soul. Even if the emergence of the human soul implies a role for the body, the role of this corporeal matter is only accidental.

To this explanation that the destruction of the body does not entail or cause the destruction of the soul, Ibn Sina adds an argument that the destruction of the soul cannot be caused by anything. Composite existing objects are subject to destruction; by contrast, the soul as a simple incorporeal being is not subject to destruction. Moreover, since the soul is not a compound of matter and form, it may be generated but it does not suffer the destruction that afflicts all generated things that are composed of form and matter. Similarly, even if we could identify the soul as a compound, for it to have unity that compound must itself be integrated as a unity, and the principle of this unity of the soul must be simple; and, so far as the principle involves an ontological commitment to existence, being simple and incorporeal it must therefore be indestructible (see Soul in Islamic philosophy).

7 Reward and punishment

From the indestructibility of the soul arise questions about the character of the soul, what the soul may expect in a world emanating from God, and what its position will be in the cosmic system. Since Ibn Sina maintains that souls retain their identity into immortality, we may also ask about their destiny and how this is determined. Finally, since Ibn Sina also wants to ascribe punishment and reward to such souls, he needs to explain how there may be both destiny and punishment.

The need for punishment depends on the possibility of evil, and Ibn Sina's examination maintains that moral and other evils afflict individuals rather than species. Evils are usually an accidental result of things that otherwise produce good. God produces more good than evil when he produces this sublunary world, and abandoning an overwhelmingly good practice because of a 'rare evil' would be a privation of good. For example, fire is useful and therefore good, even if it harms people on occasion (see Evil, problem of). God might have created a world in another existence that was entirely free of the evil present in this one, but that would preclude all the greater goods available in this world, despite the rare evil it also contains. Thus, God generates a world that contains good and evil and the agent, the soul, acts in this world; the rewards and punishments it gains in its existence beyond this world are the result of its choices in this world, and there can be both destiny and punishment because the world and its order are precisely what give souls a choice between good and evil.

8 Poetry, character and society

Identifying poetic language as imaginative, Ibn Sina relies on the ability of the faculty of imagination to construct images to argue that poetic language can bear a distinction between premises, argument and conclusion, and allows for a conception of poetic syllogism. Aristotle's definition of a syllogism was that if certain statements are accepted, then certain other statements must also necessarily be accepted (see Aristotle §5). To explain this syllogistic structure of poetic language, Ibn Sina first identifies poetic premises as resemblances formed by poets that produce 'an astonishing effect of distress or pleasure' (see Poetry).

The resemblances essayed by poets and the comparisons they put forward in poems, when these are striking, original and so on, produce an 'astonishing effect' or 'feeling of wonder' in the listener or reader. 'The evening of

life’ compares the spans of a day and a life, bringing the connotations of the day to explain some characteristics of a lifespan. To find this use of poetic language meaningful, the suggestion is that we need to see the comparison as the conclusion of a syllogism. A premise of this syllogism would be that days have a span that resembles or is comparable to the progression of a life. This resemblance is striking, novel and insightful, and understanding its juxtaposition of days and lives leads subjects to feel wonder or astonishment. Next, pleasure occurs in this consideration of the poetic syllogism as the basis of our imaginative assent, paralleling assent in, for example, the demonstrative syllogism: once we have accepted the premise, we are led to accept the associations and imaginative constructions that result; once we accept the comparison between days and lives, we can understand and appreciate the comparison between old age and evening. Ibn Sina also finds other parallels between poetic language and meaningful arguments, showing that pleasure in imaginative assent can be expected of other subjects; assent is therefore more than an expression of personal preferences. This validity of poetic language makes it possible for Ibn Sina to argue that beauty in poetic language has a moral value that sustains and depends on relations of justice between autonomous members of a community. In his commentary on Aristotle’s *Poetics*, however, he combines this with a claim that different kinds of poetic language will suit different kinds of characters. Comedy suits people who are base and uncouth, while tragedy attracts an audience of noble characters (see Aesthetics in Islamic philosophy).

9 Links to the West

Latin versions of some of Ibn Sina’s works began to appear in the early thirteenth century. The best known philosophical work to be translated was his *Kitab al-shifa’*, although the translation did not include the sections on mathematics or large sections of the logic. Translations made at Toledo include the *Kitab al-najat* and the *Kitab al-ilahiyat (Metaphysics)* in its entirety. Other sections on natural science were translated at Burgos and for the King of Sicily. Gerard of Cremona translated Ibn Sina’s *al-Qanun fi’l-tibb (Canon on Medicine)*. At Barcelona, another philosophical work, part of the *Kitab al-nafs (Book of the Soul)*, was translated early in the fourteenth century. His late work on logic, *al-Isharat wa-’l-tanbihat*, seems to have been translated in part and is cited in other works. His commentaries on *On the Soul* were known to Thomas Aquinas and Albert the Great, who cite them extensively in their own discussions.

These and other translations of Ibn Sina’s works made up the core of a body of literature that was available for study. By the early thirteenth century, his works were studied not only in relation to Neoplatonists such as Augustine and Duns Scotus, but were used also in study of Aristotle. Consequently, they were banned in 1210 when the synod at Paris prohibited the reading of Aristotle and of ‘summae’ and ‘commenta’ of his work. The force of the ban was local and only covered the teaching of this subject: the texts were read and taught at Toulouse in 1229. As late as the sixteenth century there were other translations of short works by Ibn Sina into Latin, for example by Andrea Alpago of Belluno (see Aristotelianism, medieval §3; Islamic philosophy: transmission into Western Europe; Translators).

SALIM KEMAL

List of works

Ibn Sina (980-1037) *Sirat al-shaykh al-ra’is (The Life of Ibn Sina)*, ed. and trans. W.E. Gohlman, Albany, NY: State University of New York Press, 1974.(The only critical edition of Ibn Sina’s autobiography, supplemented with material from a biography by his student Abu ‘Ubayd al-Juzjani. A more recent translation of the Autobiography appears in D. Gutas, *Avicenna and the Aristotelian Tradition: Introduction to Reading Avicenna’s Philosophical Works*, Leiden: Brill, 1988.)

Ibn Sina (980-1037) *al-Isharat wa-’l-tanbihat (Remarks and Admonitions)*, ed. S. Dunya, Cairo, 1960; parts translated by S.C. Inati, *Remarks and Admonitions, Part One: Logic*, Toronto, Ont.: Pontifical Institute for Mediaeval Studies, 1984, and *Ibn Sina and Mysticism, Remarks and Admonitions: Part 4*, London: Kegan Paul International, 1996.(The English translation is very useful for what it shows of the philosopher’s conception of logic, the varieties of syllogism, premises and so on.)

Ibn Sina (980-1037) *al-Qanun fi’l-tibb (Canon on Medicine)*, ed. I. a-Qashsh, Cairo, 1987.(Ibn Sina’s work on

medicine.)

Ibn Sina (980-1037) *Risalah fi sirr al-qadar (Essay on the Secret of Destiny)*, trans. G. Hourani in *Reason and Tradition in Islamic Ethics*, Cambridge: Cambridge University Press, 1985.(Provides insights into a neglected area of Ibn Sina’s thought.)

Ibn Sina (980-1037) *Danishnama-i ‘ala’i (The Book of Scientific Knowledge)*, ed. and trans. P. Morewedge, *The Metaphysics of Avicenna*, London: Routledge and Kegan Paul, 1973.(This is a translation of a metaphysical work in Persian.)

Ibn Sina (*c.*1014-20) *al-Shifa’ (Healing)*.(Ibn Sina’s major work on philosophy. He probably began to compose *al-Shifa’* in 1014, and completed it in 1020. Critical editions of the Arabic text have been published in Cairo, 1952-83, originally under the supervision of I. Madkour; some of these editions are given below.)

Ibn Sina (*c.*1014-20) *al-Mantiq (Logic)*, Part 1, *al-Madkhal (Isagōgē)*, ed. G. Anawati, M. El-Khodeiri and F. al-Ahwani, Cairo: al-Matba‘ah al-Amiriyah, 1952; trans. N. Shehaby, *The Propositional Logic of Ibn Sina*, Dordrecht: Reidel, 1973.(Volume I, Part 1 of *al-Shifa’*.)

Ibn Sina (*c.*1014-20) *al-‘Ibarah (Interpretation)*, ed. M. El-Khodeiri, Cairo: Dar al-Katib al-‘Arabi, 1970.(Volume I, Part 3 of *al-Shifa’*.)

Ibn Sina (*c.*1014-20) *al-Qiyas (Syllogism)*, ed. S. Zayed and I. Madkour, Cairo: Organisme Général des Imprimeries Gouvernementales, 1964. (Volume I, Part 4 of *al-Shifa’*.)

Ibn Sina (*c.*1014-20) *al-Burhan (Demonstration)*, ed. A.E. Affifi, Cairo: Organisme Général des Imprimeries Gouvernementales, 1956.(Volume I, Part 5 of *al-Shifa’*.)

Ibn Sina (*c.*1014-20) *al-Jadal (Dialectic)*, ed. A.F. Al-Ehwany, Cairo: Organisme Général des Imprimeries Gouvernementales, 1965.(Volume I, Part 7 of *al-Shifa’*.)

Ibn Sina (*c.*1014-20) *al-Khatabah (Rhetoric)*, ed. S. Salim, Cairo: Imprimerie Nationale, 1954.(Volume I, Part 8 of *al-Shifa’*.)

Ibn Sina (*c.*1014-20) *al-Ilahiyat (Theology)*, ed. M.Y. Moussa, S. Dunya and S. Zayed, Cairo: Organisme Général des Imprimeries Gouvernementales, 1960; ed. and trans. R.M. Savory and D.A. Agius, ‘Ibn Sina on Primary Concepts in the *Metaphysics* of *al-Shifa’*’, in *Logikos Islamikos*, Toronto, Ont.: Pontifical Institute for Mediaeval Studies, 1984; trans. G.C. Anawati, *La métaphysique du Shifa’*, Études Musulmanes 21, 27, Paris: Vrin, 1978, 1985.(This is the metaphysics of *al-Shifa’*, Volume I, Book 5.)

Ibn Sina (*c.*1014-20) *al-Nafs (The Soul)*, ed. G.C. Anawati and S. Zayed, Cairo: Organisme Général des Imprimeries Gouvernementales, 1975; ed. F. Rahman, *Avicenna’s De Anima, Being the Psychological Part of Kitab al-Shifa’*, London: Oxford University Press, 1959.(Volume I, part 6 of *al-Shifa’*.)

Ibn Sina (*c.*1014-20) *Kitab al-najat (The Book of Salvation)*, trans. F. Rahman, *Avicenna’s Psychology: An English Translation of Kitab al-Najat, Book II, Chapter VI with Historical-philosophical Notes and Textual Improvements on the Cairo Edition*, Oxford: Oxford University Press, 1952.(The pyschology of *al-Shifa’*.)

Ibn Taymiyya, Taqi al-Din (1263-1328)

Ibn Taymiyya was a staunch defender of Sunni Islam based on strict adherence to the Qur'an and authentic sunna *(practices) of the Prophet Muhammad. He believed that these two sources contain all the religious and spiritual guidance necessary for our salvation in the hereafter. Thus he rejected the arguments and ideas of both philosophers and Sufis regarding religious knowledge, spiritual experiences and ritual practices. He believed that logic is not a reliable means of attaining religious truth and that the intellect must be subservient to revealed truth. He also came into conflict with many of his fellow Sunni scholars because of his rejection of the rigidity of the schools of jurisprudence in Islam. He believed that the four accepted schools of jurisprudence had become stagnant and sectarian, and also that they were being improperly influenced by aspects of Greek logic and thought as well as Sufi mysticism. His challenge to the leading scholars of the day was to return to an understanding of Islam in practice and in faith, based solely on the Qur'an and* sunna*.*

Ibn Taymiyya was born in Harran, Syria, and died in Damascus in AH 728/AD 1328. He lived in a time when the Islamic world was suffering from external aggression and internal strife. The crusaders had not been fully expelled from the Holy Land, and the Mongols had all but destroyed the eastern Islamic empire when they captured Baghdad in AH 656/AD 1258. In Egypt, the Mamluks had just come to power and were consolidating their hold over Syria. Within Muslim society, Sufi orders were spreading beliefs and practices not condoned by orthodox Islam, while the orthodox schools of jurisprudence were stagnant in religious thought and practice. It was in this setting of turmoil and conflict that Ibn Taymiyya formulated his views on the causes of the weakness of the Muslim nations and on the need to return to the Qur'an and *sunna* (practices) as the only means for revival.

Although Ibn Taymiyya was educated in the Hanbali school of thought, he soon reached a level of scholarship beyond the confines of that school. He was fully versed in the opinions of the four schools, which helped lead him to the conclusion that blind adherence to one school would bring a Muslim into conflict with the letter and spirit of Islamic law based on the Qur'an and *sunna*. Similarly, he had acquired a deep understanding of philosophical and mystical texts. In particular, he focused on the works of Ibn Sina and Ibn al-'Arabi as examples of philosophical and mystical deviation in Islam, respectively. Both of these trends had come to exert strong influence on Muslim scholars and lay people alike.

Ibn Taymiyya placed primary importance on revelation as the only reliable source of knowledge about God and about a person's religious duties towards him. The human intellect (*'aql*) and its powers of reason must be subservient to revelation. According to Ibn Taymiyya, the only proper use of *'aql* was to understand Islam in the way the Prophet and his companions did, and then to defend it against deviant sects. When discussing the nature of God, he argued, one must accept the descriptions found in the Qur'an and *sunna* and apply the orthodox view of not asking how (*bi-la kayf*) particular attributes exist in God. This means that one believes in all of the attributes of God mentioned in the Qur'an and *sunna* without investigating the nature of these, because the human mind is incapable of understanding the eternal God. For example, one accepts that God is mounted upon a throne above the heavens without questioning how this is possible. This same attitude is held for all of God's attributes such as his sight, his hearing or his hand.

This view is very much opposed to the philosophical view of God as First Cause and as being devoid of attributes. Thus the philosophical argument that the oneness of God precludes a multiplicity of attributes was not acceptable to Ibn Taymiyya, because God says that he is one and that he has various attributes. This denial of the attributes of God based on rationalism was adopted by the Mu'tazila (see Ash'ariyya and Mu'tazila), of whom Ibn Taymiyya was especially critical. Even the more orthodox views of the Ash'aris, who accepted seven attributes basic to God, were criticized by Ibn Taymiyya. However, he did not go so far as to declare these two groups heretical, for they deviated only in their interpretation of God's nature. But he did not spare the label of apostate for those philosophers such as al-Farabi and Ibn Sina who, in addition to the denial of God's attributes, also denied the createdness of the world and believed in the emanation of the universe from God.

Ibn Taymiyya attacked the idea of emanation not only in its philosophical but also in its mystical context, as adopted by the Sufis (see Mystical philosophy in Islam). He felt that the beliefs and practices of the Sufis were far more dangerous than were the ideas of the philosophers. The latter were a small elite group that had little direct

effect on the masses. The Sufis, however, were widespread and had a large popular following. However, Ibn Taymiyya saw a link between the ideas of the philosophers and those of the Sufis, even though apparently they had little in common.

The main tenet of Sufi thought as propounded by Ibn al-‘Arabi is the concept of the oneness of existence (*wahdat al-wujud*). Through this belief, Sufis think they are able to effect a merging of their souls with God’s essence. That is, when God reveals his truth to an individual, that person realizes that there is no difference between God and the self. Ibn Taymiyya saw a link between the Sufi belief of *wahdat al-wujud* and the philosophical concept of emanation. Although the philosopher would deny that a human soul could flow into, and thus be, the First Cause, the mystical experience of the Sufis took them beyond the realm of intellectual discourse. According to the mystic, a merging occurred but could not be expressed in rational terms. For Ibn Taymiyya, both the philosopher and the mystic were deluded, the former by reliance on a limited human intellect and the latter by excessive emotions.

Ibn Taymiyya’s argument against the Sufis is on two levels. First, there is the theological position that God has attributes and that one of these attributes is God as creator. Ibn Taymiyya believed that the Qur’an firmly establishes that God is the one who created, originated and gave form to the universe. Thus there exists a distinction between God the creator and the created beings. This is an absolute distinction with no possibility of merging. He then went on to say that those who strip God of his attributes and deny that he is the creator are just one step away from falling into the belief of *wahdat al-wujud*. This is the basis for the second part of his argument. Ibn Taymiyya believed that a Sufi is simply someone who is overcome by an outburst of emotion. For example, someone may deny God’s attributes but could then be overwhelmed by a feeling of love for God. However, the basis of that person’s knowledge is not the authentic information from the Qur’an, and so their weak intellectual foundation collapses with the onslaught of emotion. For according to Ibn Taymiyya, sense perception and emotions cannot be trusted, and the likelihood of being led astray by them is compounded when one has a basis of knowledge which is itself errant and deviant. One holds a proper belief in God and maintains a proper relationship with him, Ibn Taymiyya argued, by establishing a foundation of knowledge based on the Qur’an and authentic *sunna*.

Ibn Tufayl, Abu Bakr Muhammad (before 1110-85)

Ibn Tufayl's thought can be captured in his only extant work, Hayy Ibn Yaqzan (The Living Son of the Vigilant), a philosophical treatise in a charming literary form. It relates the story of human knowledge, as it rises from a blank slate to a mystical or direct experience of God after passing through the necessary natural experiences. The focal point of the story is that human reason, unaided by society and its conventions or by religion, can achieve scientific knowledge, preparing the way to the mystical or highest form of human knowledge. The story also seeks to show that, while religious truth is the same as that of philosophy, the former is conveyed through symbols, which are suitable for the understanding of the multitude, and the latter is conveyed in its inner meanings apart from any symbolism. Since people have different capacities of understanding that require the use of different instruments, there is no point in trying to convey the truth to people except through means suitable for their understanding.

1 Life and works

Abu Bakr Muhammad Ibn 'Abd al-Malik Ibn Muhammad Ibn Muhammad Ibn Tufayl al-Qaysi is known to the West as Abubacer. It can be estimated that he was born in the first decade of the sixth century AH (twelfth century AD), based on the fact that he was in his sixties when he met Ibn Rushd in AH 564/AD 1169. Born in Wadi Ash (Guadix), a small town in Spain about sixty kilometres northeast of Granada, he died in Morocco in AH 581/AD 1185. Ibn Tufayl was the second most important Muslim philosopher in the West, the first being Ibn Bajja.

With the exception of some fragments of poetry, his only extant work is *Hayy Ibn Yaqzan (The Living Son of the Vigilant)*. The title and names of characters of this work are borrowed from two of Ibn Sina's philosophical treatises, *Hayy Ibn Yaqzan* and *Salaman and Absal*, and its framework is borrowed from an ancient eastern tale, *The Story of the Idol and of the King and His Daughter*. The title is taken from the name of the main character, Hayy Ibn Yaqzan. In the introduction and conclusion, the author addresses the reader directly; in other parts of the work, he uses a 'thin veil', a symbolic form, a story to express his philosophical views.

2 Ibn Tufayl's introduction to *Hayy Ibn Yaqzan*

In the introduction the author presents some of the views of his predecessors, al-Farabi, Ibn Sina, al-Ghazali and Ibn Bajja. Al-Farabi is strongly criticized for what is said to be his inconsistent view concerning the afterlife. No criticism of Ibn Sina is given; on the contrary, it is said that Ibn Sina's oriental wisdom will be expounded in the rest of the work. Ibn Bajja's views are said to be incomplete, mentioning the highest speculative state but not the state above it, that of 'witnessing' or mystical experience (see Ibn Bajja). While al-Ghazali's mystical experience is not in doubt (see al-Ghazali), none of his works on mystical knowledge are said to have reached the author. The introduction is intended to announce the author's intention, namely the elaboration of Ibn Sina's oriental wisdom and to show how the work differs from those of his predecessors.

3 Hayy's birth and rational progress

The story of Hayy Ibn Yaqzan takes place on an equatorial island uninhabited by human beings. There Hayy is found alone as an infant. Philosophers were of the opinion that he was born spontaneously when the mixture of elements reached an equilibrium state, making it possible for this mixture to receive a human soul from the divine world. Traditionalists believed that he was the son of a woman who chose to keep her marriage to her relative, Yaqzan, secret from her brother who ruled a neighbouring island and did not find any man qualified to marry his sister. After breastfeeding Hayy well, she put him in a box and threw it into the waters, which took him to the uninhabited island.

A deer who had just lost her son and was still experiencing the feelings of motherhood heard Hayy's cries. She suckled him, protected him from harmful things and took care of him until she died when he was seven years of age. By then he had learned to imitate other animals in speech, and he covered parts of his body with leaves after noticing that those animal parts are covered with hair or feathers. The deer's death transformed Hayy's life from one of dependency to one of exploration and discovery.

In an effort to find out the reason for the deer's death, a reason which he could not locate by observing her

appearance, he dissected her with sharp stones and dry reeds. Noticing that every bodily organ has a proper function and that the left cavity of her heart was empty, he concluded that the source of life must have been in this cavity, and must have abandoned it. He reflected on the nature of this vital thing, its link to the body, its source, the place to which it has departed, the manner of its departure and so on. He realized that it was not the body but this vital entity that was the deer and the source of its actions. With this realization he lost interest in the deer's body, which he then viewed as a mere instrument. While he could not decipher the nature of this vital thing, he observed that the shape of all deer was similar to that of his mother. From this he concluded that all deer were managed by something similar to the vital thing that managed his mother's life.

After his discovery of life, he came across a fire. He noticed that, contrary to other natural objects, which move downward, fire moves upward. This indicated to him that the essence of fire is other than that of natural things. He continued to investigate other parts of nature: animal organs, their arrangement, number, size and position, as well as the qualities that animals, plants and inanimate things have in common and those that are proper to each of them. Through continued reasoning he grasped the concepts of matter and form, cause and effect, unity and multiplicity, as well as other general concepts concerning the earth and the heavens. Concluding that the universe is one in spite of its multiple objects, he moved on to consider whether it is created or eternal. Through highly sophisticated reasoning, he found that neither the idea of creation nor that of eternity is immune to objection. Though he could not rationally decide whether the universe is created or eternal, he concluded that it must have a cause on which it remains dependent and that this cause or necessary being is non-physical and above it in essence, even if not in time.

He also concluded that the thing in him which knew this cause must also be non-physical. The more detached this non-physical thing in him was from sensory perceptions, the clearer was its vision of this cause, a vision that gave the highest joy. Even though sensations obstructed this vision, he felt obliged to imitate animals by experiencing sensations to preserve his animal soul, which would enable him to imitate the heavenly bodies. Imitating the heavenly bodies by doing things like circular movement provided him with continuous but impure vision, for attention in this type of imitation is still paid to the self.

By knowledge of the necessary being, Hayy sought to imitate this being's positive attributes; by an attempt to transcend the physical world, he sought to imitate the negative ones. Imitation of the necessary being for the sake of this being involved no attention to the self and hence provided him with pure vision. Not only was Hayy's self or essence obliterated in this state, but so also was everything other than the necessary being. No human sight, hearing or speech could grasp this state, as it lies beyond the world of nature and sense experience. Therefore no explanation of necessary being can be given, only mere signs, as Ibn Sina contends in *al-Isharat wa-'l-tanbihat (Remarks and Admonitions)*. One who seeks an explanation of this state is like one who seeks 'the taste of colours inasmuch as they are colours'. Verification requires direct experience. Using human language, which is described as an inadequate instrument, to hint at the truth Hayy is said to have witnessed in this state, the necessary being is said to pervade the universe as sunlight pervades the physical world. Trying to express the inexpressible, the author says that Hayy realized in this state that the whole is one, even though unity and multiplicity, like other contraries, exist only for sense perception. The Neoplatonic pantheistic tendency is here obvious (see Necessary being; Neoplatonism).

4 Harmony of Hayy's philosophy with revealed religion

On a neighbouring island a group of people, including the king, Salaman, practised a religion which was sound yet provided the masses with symbols, not direct truths. Absal, a friend of Salaman, observed the rituals of this religion but, contrary to others who adhered to its literal meaning, he delved into its inner truths. Being naturally inclined to solitude, which was in agreement with certain passages of the Scripture, Absal moved to the island on which Hayy lived. When he encountered Hayy he was frightened, until Hayy made it clear that he intended no harm. Absal then taught Hayy human language by pointing to objects while uttering the corresponding words.

With the acquisition of language, Hayy was able to explain to Absal his development in knowledge. At hearing this, Absal realised that what Hayy had witnessed were the realities described in his own religion: God, the angels, the holy books, prophets, afterlife and so on. When Absal discussed the truths as detailed in his religion, Hayy too found these truths in agreement with what he had come to know. However, Hayy could not understand why Absal's religion resorted to symbols and permitted indulgence in material things.

5 Suitability of religion in its outward aspect to the majority of people

Hayy expressed interest in visiting the neighbouring island to explain to its people the pure truth. Absal, who knew their nature, reluctantly accompanied him. Addressing the most intelligent group on this island, Hayy was shown respect until he tried to go beyond the literal meaning of their Scripture. The people then shunned him, distracting themselves from the truth by commercial activity. Hayy understood then that such people are incapable of grasping the direct truth and that religion is necessary for their social stability and protection. Social stability and protection, however, in no way secure happiness in the afterlife. Only preoccupation with the divine, which is rare among people of this kind, can provide such security. In contrast, the preoccupation with this world in which the majority of people indulge results in darkness or hell. While the truths of reason and revelation are the same, the majority of those adhering to the latter do so for worldly success and hence achieve eternal misery. Realizing that an attempt to enlighten those incapable of vision will only destabilize them without preparing them for happiness, Hayy asked people to continue practising their religion, warning them only against indulgence in worldly matters. Hayy and Absal returned then to the deserted island to practise their mysticism in isolation.

Ibn Tufayl ends the work by describing it as ‘containing a piece of discourse not found in a book nor heard in ordinary speech’. How is this to be understood when he had already told us in the introduction that the work is an elaboration of Ibn Sina’s oriental wisdom? Perhaps the answer can be found in Ibn Tufayl’s emphasis on the novelty of a certain ‘discourse’ or ‘speech’, not on the novelty of its content. If so, the originality of the work would seem to lie only in its form.

(1956) ‘The Principal Subject of Ibn Tufayl’s Hayy Ibn Yaqzan’, *Journal of Near Eastern Studies* 15 (1): 40-46.(An excellent article, which reconsiders the principal subject of Ibn Tufayl’s *Hayy Ibn Yaqzan*. It rejects Gauthier’s thesis that the essential subject of the work is the harmony of religion and philosophy, arguing instead that it is the ascent of unaided human reason from elementary to mystical knowledge.)

Ibn Tzaddik, Joseph ben Jacob (d. 1149)

Joseph ibn Tzaddik was a thinker firmly within the Neoplatonic tradition of Jewish philosophy. He argued that through knowledge of our own body we understand the natural world, and through knowledge of our soul the spiritual world. He identified prophecy with philosophy and suggested that we need to employ both philosophy and the religious commandments in order to worship God. Not everyone can understand philosophy, but everyone can follow the commandments and thus approach God. Human beings will receive their deserts in the next world. The pure soul will rise to the realm of spirituality, while the evil soul will be heavy and sink into matter, never achieving repose but continually caught up in the movement of the spheres.

1 Life and works

Of Ibn Tzaddik's life we know very little. He seems to have been a well-known poet. From 1138 he was a rabbinical judge at Cordoba. He died in 1149. He was clearly influenced by Isaac Israeli and Solomon Ibn Gabirol. His major work, *al-'Alam al-Saghir*, has survived only in an anonymous Hebrew translation entitled *Ha-Olam ha-Katan (The Microcosm)*, a title indicative of the theme that unites the work. For Ibn Tzaddik follows Israeli's conception of philosophy as human self-knowledge. Man is a miniature of the world; and the world, in turn, a human being writ large. Humans are a microcosm because they have in themselves all elements of the universe.

The text is divided into four parts or discourses. The first deals with physics, the principles and constitution of the corporeal world. The second discourse, developing the idea that man is a microcosm of the larger world, deals with anthropology and psychology. Discourses three and four reflect the familiar concerns of *kalam* (dialectical theology), namely the existence, unity and attributes of God; theodicy; freedom of the will; and reward and punishment. Influenced by Saadiah Gaon, Bahya Ibn Paquda, Ibn Gabirol and Islamic *kalam* theologians, Ibn Tzaddik combines familiar Jewish Neoplatonic themes along with Aristotelian and *kalam* influences. Two requisites are necessary for philosophic understanding: knowledge of God and performance of his will. But in order to acquire this level of philosophy, one must have a knowledge of everything else as well. And self-knowledge is the key to the requisite knowledge of all things.

2 Why human beings study themselves

Part One of the text starts with knowledge of the physical world, which ultimately reflects back upon the individual knower. Humans perceive things in two ways, through sense (*ha-regesh*) and through intellect (*ha-sekhel*). The five senses yield knowledge of accidental qualities, or 'shells'; reason penetrates to the true nature or essence of a thing. Knowledge can be classified as either self-evident (immediate) or demonstrated (mediate). Correspondingly, there are four kinds of objects of knowledge: percepts of senses (*murgashot*); self-evident truths (*mefursamot*); traditions (*mekubalot*); and axioms (*muskalot*). According to Ibn Tzaddik, each of these can be traced back to either rational or sensory knowledge. The former is superior, for it distinguishes humans from animals.

The second discourse treats of ontology, and it displays the influence of both Israeli (§2) and Ibn Gabirol (§2). Matter is the foundation (*ha-yesod*) and principle of all things (see Matter). The common matter of the four elements is prime matter, which is endowed with the form of corporeality (*etzem gishmi*). Matter and form are relative to each other. Spiritual things are also composed of matter and form. In spiritual things, we may compare genus to matter, species to form, specific difference to efficient cause and individual to final cause. It is here that Ibn Gabirol's influence is most evident. Everything exists either in itself (*omed be'atzmo*) or in something else (*omed be-zulatto*). Thus matter exists in itself, whereas form exists in matter. After matter assumes a form, matter becomes an actual substance. However, matter and form can be separated only in thought, not in reality. Substance is is capable of bearing opposite and changing qualities. A substance can be the opposite of another only through its accidents. Absolute substance (*ha-etzem hamuhlat*) is pure and spiritual. It is what remains of a corporeal substance when we take everything away, and is similar to Ibn Gabirol's substance which supports the categories (see Substance). Ibn Tzaddik then turns to the corporeal world (*ha-'olam hagishmi*), namely the spheres, the four elements and the three natures. The sphere (*galgal*) differs from other bodies in matter, form and qualities. Moving in a circle, the sphere has the most perfect of motions. For spherical motion has no beginning or end. The sphere

also has knowledge of God. The four elements - fire, air, water, earth - are simple bodies and have no qualities. They can change into each other. The basis of the elements is a substance filling place as a result of its assuming the form of corporeality. The three natures - plant, animal and mineral - are composed of the four elements. The general process of the sublunar world is genesis and dissolution. Thus, the world is not permanent, for the basis of its processes is change. The human body corresponds to the corporeal world in that it too is subject to genesis and decay. It is composed of elements and has powers of growth and sustenance like plants. In true Neoplatonic fashion, Ibn Tzaddik claims that humans are superior to all other beings in that they comprise all of them. In so far as the human is a 'celestial plant', its head is directed heavenward (see Natural philosophy, medieval).

3 The activity of the soul

Part Two of *Ha-Olam ha-Katan* deals with the different types of souls. Clearly combining Platonic and Aristotelian themes in an uncritical fashion, Ibn Tzaddik distinguishes three types of soul: the vegetative, the animal, and the rational (see Plato §14). The faculty of the plant soul is appetition, and the seat of the faculty is the liver. All of its powers derive from universal powers in the upper world. The animal soul is seated in the heart; it is borne in the blood. Its functions are motion and sensation. Life is the effect of the animal soul. Death is the separation of rational soul (*ha-nefesh ha-chokhma*) from the body. Death results from an imbalance of the four humours in the heart, or by disease or injury to the brain. The rational soul is incorporeal; thus it is not located in the body. Like Aristotle (§17), Ibn Tzaddik holds that the soul is a substance, not an accident, for it is permanent - reason is essential to humans. Moreover soul is superior to body, so it must be a spiritual substance, since the higher entity, it is reasoned, could not be a mere accident while the lower is a substance. All three souls are spiritual powers. The rational soul and the intellect have a common matter. When the soul is perfected it becomes intellect; the only difference between the two is one of degree and excellence, inasmuch as the intellect comes straight from God without intermediary. The activity of the rational soul is knowing, exploring the unknown. The rational soul of one who studies is destined for the spiritual world. In order to study, a person's animal impulses must be deadened. The person then comes to know first the corporeal world, then the spiritual world, and finally the Creator. Knowledge of God is the highest kind of knowledge and the basis of human perfection. Ibn Tzaddik states that those who have no such knowledge are doomed to error. The existence of many individual souls is evidence that there must be a universal or world soul. The universal soul is received into all living bodies; just as objects receive the sun's light, so too splitting of the world soul into many souls is due to the plurality of bodies which absorb it.

4 The unity of God

How do we achieve knowledge of God? Following Bahya Ibn Paquda (§2), and contrary to the practitioners of *kalam*, Ibn Tzaddik argues that God's essence is unknowable. To know a thing, we must investigate its four causes, but with God we can only know whether he *is*, not what he is. Ibn Tzaddik offers a rudimentary proof for the existence of God as follows: if substance and accident are not eternal, something must have brought them into being. This something is God. Furthermore, since the cause of the many must be one, God is one. Ibn Tzaddik goes on to show, by means of *kalam* arguments, that there cannot be two eternal beings.

The troubling question is why God created the world at all. Clearly this is not because God lacked anything. For God is complete and needs nothing. Creation is an act of will, but Ibn Tzaddik regards God's will as eternal, not created. What then is the relation of God's will to God? As Guttman points out (1966: 131), Ibn Tzaddik's answer is ambiguous. Divine will is identical with divine essence, yet Ibn Tzaddik does not explain how this will and essence are compatible with God's immutability. According to Ibn Tzaddik, God is beyond space and time. So when we say that God's will created the world, we cannot mean either that creation is taking place now or that it took place at any definite time. Ibn Tzaddik simply declares that God created the world *ex nihilo* and that it is perfect. When he speaks of creation as a mystery, he suggests that not all men can understand the secrets of philosophy. Only a hint of these matters should be given, and intelligent individuals will comprehend of their own accord.

With respect to God's attributes, Ibn Tzaddik claims that they are different from all other attributes, in that they are all identical with his essence. The very notion of divine attributes can be applied only figuratively. The predicates assigned to God express either action or essence. But, in the end, both sorts are aspects of the same attribute. Divine attributes become models of moral action. We derive our knowledge of God from his effects, but ultimately

we can apply them only negatively.

5 Theodicy

Ibn Tzaddik's distinction between rational and traditional commandments is similar to those of Ibn Paquda (§2) and Saadiah Gaon (§2). These commandments are for our own good, so that we may be happy in the next life. Ibn Tzaddik's discussion of the four virtues (wisdom, courage, temperance and justice) is clearly influenced by Plato's four virtues. For Ibn Tzaddik, as for many of his contemporaries, knowledge of a suprasensual world is a prerequisite for eternal happiness. As recent scholars have pointed out, the identification of prophecy and philosophy causes problems because philosophy includes a number of sciences hard to envisage as having been revealed on Mount Sinai. Ibn Tzaddik attempts to resolve this problem by affirming that at the time of the Torah, God bestowed prophecy on the whole people, for such was his will; but since at the present time no one can attain philosophy, that is, prophecy, except through the mediation of science, all must successively acquire the various degrees of science. Science and the desire urging man towards God are common to all, but the aptitude for science depends essentially on climatic conditions. The good soul is knowledgeable and survives in the upper world. The bad soul loses its spirituality and revolves forever with the spheres in the world of fire. When the messiah comes, the saints will be brought back to life and never die again; the wicked souls will be rejoined to their bodies and burnt.

Idealism

Idealism is now usually understood in philosophy as the view that mind is the most basic reality and that the physical world exists only as an appearance to or expression of mind, or as somehow mental in its inner essence. However, a philosophy which makes the physical world dependent upon mind is usually also called idealist even if it postulates some further hidden, more basic reality behind the mental and physical scenes (for example, Kant's things-in-themselves). There is also a certain tendency to restrict the term 'idealism' to systems for which what is basic is mind of a somewhat lofty nature, so that 'spiritual values' are the ultimate shapers of reality. (An older and broader use counts as idealist any view for which the physical world is somehow unreal compared with some more ultimate, not necessarily mental, reality conceived as the source of value, for example Platonic forms.)

The founding fathers of idealism in Western thought are Berkeley (theistic idealism), Kant (transcendental idealism) and Hegel (absolute idealism). Although the precise sense in which Hegel was an idealist is problematic, his influence on subsequent absolute or monistic idealism was enormous. In the US and the UK idealism, especially of the absolute kind, was the dominating philosophy of the late nineteenth and early twentieth century, receiving its most forceful expression with F.H. Bradley. It declined, without dying, under the influence of G.E. Moore and Bertrand Russell, and later of the logical positivists. Not a few philosophers believe, however, that it has a future.

1 The general case for idealism

As the term will be used here, a philosopher is an idealist if and only if they believe that the physical world exists *either* (1) only as an object for mind, *or* (2) only as a content of mind, *or* (3) only as something itself somehow mental in its true character, a disjunction we shall sum up as the thesis that the physical is derivative from mind. Particular idealists may go further and say that everything whatever is derivative from mind except mind itself, but this would not be affirmed by, for example, Kant, who believed in things-in-themselves which may be neither mental nor mind-derivative; neither, perhaps, would it be accepted by Schopenhauer, for whom Kant's things-in-themselves become an unconscious cosmic Will. Moreover, there is no one view of the status of so-called abstract objects or universals which seems required of an idealist (see Abstract objects).

The mind-dependence of the physical has been argued for and developed in widely varying ways. For example, the idealist may be a monist or a pluralist about the mind(s) from which the physical is derivative. Very significant too is the contrast between idealisms which are more ontological and those which are more epistemological in their approach. The two great exemplars of each are George Berkeley and Immanuel Kant, the founding fathers of Western idealism and sources of most subsequent arguments in its favour.

Ontological idealism affirms that a certain view of reality, in which the physical is mind-dependent, is absolutely true, and regards such elements of common sense or science as seem to conflict with this either as wrong, or as only seemingly incompatible. Epistemological idealism is concerned, rather, to show that the most acceptable views of the physical world, which doubtless include the claim that it is not mind-dependent, are, indeed, only true-for-us, but that truth-for-us is the only kind of truth it makes sense to seek. (A more qualified epistemological idealism may allow that chinks of a more absolute truth may suggest themselves and be important, but hardly belong to the main body of what we should call knowledge.) Thus, for idealism of the second kind, the mind-dependence of the physical is not so much a claim as to what is true about it, as about the sort of truth which truth about it is.

2 Berkeleian ontological idealism

According to Berkeley, there are only two types of existent - spirits (or minds) and ideas. Physical objects, as we ordinarily conceive them, are collections of sensory ideas (sense impressions). Thus an apple is simply a collection of such sensory appearances as we are immediately aware of when we say that we are perceiving it (including the sensation of eating it). As for things, or those aspects of things, which are not perceived by any finite mind, they are there *either*: in the secondary sense that they would come into our minds if we took appropriate steps (gave ourselves appropriate impressions of moving in certain ways) to have a look at them, a sniff of them or whatever; *or* they are being perceived by an infinite mind. The second alternative brings in God immediately, the first is only

explicable by saying that they are ideas which God would produce in us as a result of our taking those steps. Either way, the idealist truth that physical objects are collections of ideas, taken together with the obvious fact that everything is as though they continued their existence when unobserved by finite minds, appears to Berkeley an incontestable proof of God’s existence.

Two of the main reasons why Berkeley thought that the physical world must consist of ideas were:

1 It is only if physical objects are conceived as collections of ideas which hang together in experience that we have any empirical evidence for their existence.
2 It is generally admitted that the so-called secondary qualities of physical things only exist as ideas in our minds (see Primary-secondary distinction). Moreover, it could be proved by the way in which secondary qualities vary with the state of the observer, and the way in which they are inseparable from sensations of pleasure and pain. But the considerations which show that secondary qualities are mind-dependent show equally that the primary ones are too. (Presented shape varies with conditions of observation as much as colour.) Moreover, no one can conceive of primary qualities existing in the absence of secondary qualities, so that they can only exist tied up with the admittedly mind-dependent.

It is usual to say that Berkeley’s line of thought works only if one already accepts doctrines which he adopted uncritically from Locke (as he understood him), namely that all we ever perceive are ideas, and that secondary qualities are mind-dependent. It is, therefore, worth emphasizing that arguments of an essentially Berkeleian sort can be presented, and have been influential, which do not depend upon this Lockean inheritance.

The core of these arguments will be: physical objects, as they present themselves to our senses, do so with qualities which we cannot suppose to exist except for a perceiving mind. Indeed, we cannot even conceive them lacking all such qualities. These qualities, with which things present themselves to the senses, include what we may call all their perspectival qualities (the thing is given with features which reflect the position from which it is seen or the way in which it is felt and so on), also hedonic and aesthetic qualities, and finally an organization of the perceptual field into foreground and background, and into certain *Gestalten*. However much you try to imagine a thing as it is in itself, apart from any observer, you will find yourself imagining it as having features which represent the rough position of an observer of it, how they feel about it, and how they organize their perceptual field. In short you can only imagine it with features which it could only have as a presence to some observer. Such reasoning continues to persuade those of a Berkeleian cast of mind that one cannot form any genuine conception of a physical world existing except as an object for an observer.

All this is likely to invite two objections. First, it may be said that you should distinguish between the representation (such as an image in your mind) and what that representation represents for you. Only certain features of the image serve a representative function. Now the fact that the image may have some of the features which an actual sense impression of it would have only if the thing were perceived in a certain way, does not mean that these features must be regarded as belonging to what is represented. To this it may be replied by the idealist that they do not deny that, by ignoring certain features of the image, you can regard only the others as playing a role in picturing the object; and that these need not include those which obviously imply presence to a subject. What they deny, in contrast, is that one can form any sort of representation which will, so-to-speak, positively depict the thing as existing without subject-implying features. And unless one can do this one has no real sense of what an unperceived thing could be like.

The second objection is that one can conceive what one cannot imagine. Surely you can *conceive* a physical thing without these subject-implying features even if you cannot *imagine* it. To this the idealist may reply that you do not really understand what you are thinking if you only think about it in words (and doubtless this is what the objector means by conceiving it). Really to bring before your mind the character of the situation you believe in requires that, using the expression broadly, you must *imagine* it, and this you cannot do except by imagining it as it would present itself to a certain observer.

Such a line of thought, though not precisely Berkeley’s in detail, is Berkeleian in spirit and inspiration and it is likely to be a main plank of an ontological idealism which claims that unperceived physical reality is an impossibility. What positive view of the world can be based upon such reflections? For Berkeley it showed that there must be a God who is responsible for those ideas which (after acting in a certain way) we have no choice but

to experience and who keeps the whole system of ideas available to each individual spirit in conformity with a universal system of laws determining the appearances available to each.

However, there have been philosophers who put forward a phenomenalism supposed not to imply the existence of God. According to them, one can speak meaningfully of physical things as existing unperceived. However, these only exist in a secondary sense as compared with those which are actually perceived, and their existence in this secondary sense is only the fact that they are available for perception. That is, there are definite facts for each of us (according to what we would ordinarily call our position in space) which determine what perceptions are available or compulsory for us in response to what we do or suffer (what sensations of movement we give ourselves or are given). There is no need to suppose that there is some explanation for this; it must just be accepted as a brute fact.

This phenomenalism is often not classed as idealist because its reductive account of the physical is divorced not only from theism, but from any other conception of the world as shaped by Reason or other higher forms of Mind. It is a puzzle of intellectual history that some of those most influenced by Berkeley's views of physical reality have been among the most atheistic and, in the popular sense, most 'materialist' of thinkers (for example, T.H. Huxley, A.J. Ayer and, with qualifications, J.S. Mill).

3 Kantian transcendental idealism

A simple version of Kant might present him as a phenomenalist who supplemented his phenomenalism with the admission that there must be some explanation of why the sense experiences available to us are what they are, yet who regarded this explanation as unavailable to us except as the thesis that they result from unconscious operations which we (as we really are rather than as we appear to ourselves) conduct upon things-in-themselves of whose real character we can know nothing (except that it cannot be that of anything properly called physical). However, Kant's reasoning for his transcendental idealism is largely different from those deriving from, or inspired by, Berkeley (see Kant, I. §5).

For Kant there are two striking facts about our knowledge of the world which only his transcendental idealism can explain ('transcendental' means 'having to do with our cognitive powers'). First, we have a great deal of 'synthetic a priori' knowledge about it (see A priori; Analyticity). Thus we know that arithmetic and the axioms of Euclid apply to the physical world as a whole, that every physical or mental process occurs in conformity with universal causal laws, and that change requires a permanent substratum of matter which remains quantitatively the same. Second, neither a priori nor empirical knowledge can answer the great questions of human destiny, such as whether God exists and whether we are immortal. The only possible explanation of our synthetic a priori knowledge about the physical and, indeed, mental worlds is that it is really our knowledge of our own cognitive nature. Space and time are the forms of our perceptual intuition and the categories of causation, substance and accident and so on are the categories by which we construct the unitary world of our actual and possible experience out of unconscious stimuli which reach the hidden self from things-in-themselves (or 'noumena'), of whose character we must remain ignorant. And it is because we are ignorant of things-in-themselves that we cannot *know* the answers to the questions about God and immortality, for these concern absolute truth rather than that truth-for-us which is all that is available for knowledge. On the other hand, just because we cannot *know* the answers to these questions, we may have *faith* that they would suit our moral natures and show that, in spite of the causal determinism holding in the phenomenal world, we are responsible at some 'noumenal' level for our own adherence or otherwise to the categorical imperatives of morality.

Some of the details of Kant's theory are outmoded by the fact that science seems no longer committed to some of his supposedly synthetic a priori truths such as the axioms of Euclid and the universality of causation. However, the idea that the world as we know it owes, to an incalculable extent, its general character to our particular modes of perception and thought still has great force. In Berkeley there was no suggestion that what we know is created by our knowledge of it. The ideas which constitute the physical world are simply the ones which God has chosen to give himself and us and to organize in a certain way. Our knowledge of those we perceive is a fully accurate knowledge by direct acquaintance and the existence and character of others, as actualities or possibilities, is known by induction. In Kant, knowledge itself to a great extent creates its objects by unconscious operations upon unconscious stimuli reaching us from things-in-themselves whose real nature it leaves in darkness.

The distinction is somewhat subtle, since both the Berkeleian and Kantian, in effect, regard facts about the physical world as facts about the perceptions we may obtain through sensations of movement in certain directions. However, the Berkeleian inheritance has mainly been to insist on the way in which the physical world cannot be conceived without sensory qualities which can only occur as contents of experience, while the Kantian inheritance has mainly been to insist on the way in which our cognition of the physical world interprets it by concepts which it *brings to* experience rather than *abstracts from* it.

In fact, Kant's position is nearer to Berkeley's than he himself allowed. According to Kant his idealism is transcendental, whereas Berkeley's is empirical. What this comes to is that Berkeley's idealism professes to give the absolute truth about the physical world, as a corrective to a realism which regarded it as existing independently of mind, while Kant accepted such realism, but claimed that it was only true for us, and that, as for the absolute truth about things which underlie it, we know nothing beyond the mere fact that there must be such an absolute truth (in the moral and theistic significance of which we may have faith).

4 German absolute idealism

The great figures in German absolute idealism were J.G. Fichte, G.W.F. Hegel and F.W.J. von Schelling (see Absolute, the). (The character of their considerable political influence cannot be considered here.) In effect, each agreed with Kant that ordinary common sense and 'scientific' (in our usual sense, not theirs, in which it referred to their own philosophic conclusions) truth about the physical world is only truth for us. But they went beyond Kant in holding that philosophy can put this in the context of an absolute and rationally demonstrated truth about an essentially spiritual world. In fact, Kant's attempt to close the door on attempts to know the ultimate truth of things opened it to some of the most robust claims ever made to have probed the mysteries of the universe.

For Kant the physical world only exists for us, and our knowledge of it is only truth for us. However, we can recognize that there must be two hidden determinants of it, modes of cognition which take place in our own hidden depths, and the unconscious non-physical stimuli from mysterious things-in-themselves out of which they make the familiar physical world. Fichte thought the postulation of such things-in-themselves quite unnecessary. If the knowable physical world is something whose form we construct unconsciously why should not the matter be something we determine unconsciously too? Thereby we avoid the nebulous hypothesis of things-in-themselves, and are left simply with our own indubitable existence and hidden depths thereof, of which we dimly sense the presence. Of course there is an external world or non-ego, but it exists only as something which the ego posits and does so for reasons the general character of which can be deciphered. For the ego wants to live a life of moral worth and this it can only do if it has obstacles to overcome; thus the external world it posits consists precisely in those obstacles whose over-coming is most morally valuable at its current stage of development.

But how is it that each ego shares a non-ego, as it evidently does, with other egos? Fichte has two related answers. One is that moral development is something which can only occur in a community, so that the different egos need to posit a shared non-ego giving them a common environment in which to work out their moral destiny. Second, as his thought developed, Fichte became clearer that the ego which is working out its moral destiny in each of us is really a single world-spirit living out an apparent multiplicity of lives. Fichte developed this account by way of a dialectical method which became the hallmark of German idealism (inspired by Kant for whom, however, it was rather a source of illusion than a means to truth) in which apparently opposed truths are successively reconciled in higher syntheses until absolute truth is reached. Thus was born absolute idealism, in which the reality behind both nature and finite mind is a single absolute mind or self in process of self-discovery or development. However, Fichte's brand of absolute idealism is sometimes also called 'subjective idealism', because it regards the natural world as existing only for the subjective experience of finite individuals, expressions of a single world self though they may be.

Schelling was originally a follower of Fichte, but his continually shifting versions of idealism tended to become more 'objective' or at least more positively concerned with nature for its own sake. The Absolute or universal self does not simply dream the physical world as the scene of moral endeavour but rather expresses itself in a parallel dialectic, both 'really' in the nature from which the mind arises and 'ideally' in the mind for which nature exists. The two come together eventually in philosophical understanding and, more concretely, in art.

Absolute idealism, and the dialectical method and ontology, reached its historically most important form in the

philosophy of Hegel. For Hegel, the world consists in a series of terms each surpassing its (only sometimes temporal) predecessors by incorporating what was satisfactory in them, in a manner which reconciles in a higher synthesis that in which they contradicted each other. The series begins with pure concepts, leading on to actual natural and then humanly historical processes and terminates in a community in the free service of which each individual can find themselves fulfilled and in the consciousness, in the minds of philosophers, of its total nature. Thus, everything exists as path to, and as fodder for, a rich communal spiritual life, but how far this means that nothing really exists except as a component within or object for consciousness or spirit, is controversial. Therefore, it is unclear how far Hegel was an idealist in our sense (as opposed to the broader sense mentioned parenthetically above).

Hegel and Schelling had originally seen themselves as partners in developing a new philosophy, but Hegel soon surpassed his at first better known associate in fame and influence. However, Schelling had his turn again on Hegel's death, developing a new so-called positive philosophy in which he rejected the high a priori road to the nature of existence which both thinkers had taken previously. Absolute idealism must appeal partly to empirical features of the world rather than merely cite them sometimes as illustrations of what reason can independently prove must be so. This more traditionally Christian philosophy sought to give God and man a freedom effectively denied them by Hegelianism. Its somewhat bizarre ontology also seemed to many to show German idealism in its death throes.

In different ways Fichte, Schelling and Hegel each held that the world could only be understood through realizing that it is the concrete actualization of concepts whose proper home is in the mind. This binds them to Kant, but they sought to go beyond him in explaining why the relevant categories are just as they are and why there is a real unity of experience common to apparently different minds: namely that, in the end, the world is the construction of one universal Mind or Reason. Each saw himself as drawing on Spinoza as well as Kant, but as substituting an ultimate self or subject for Spinoza's substance.

Standing quite apart from these absolute idealists is the lonely but immensely influential figure of Arthur Schopenhauer. Arguably the closest metaphysically, if not in mood, to Kant, and accepting in the main his transcendental idealism, he claimed to have discovered the true nature of the realm of things-in-themselves, regarding them as aspects of a single universal Will, manifesting itself as object for a subject (which was its own self fallen into a state of wretched self-assertion), from which it can escape only by a culmination of that denial of the will to live, characteristic, as he saw it, of sainthood.

5 Anglo-American absolute idealism

As German philosophers moved away from idealism in the later part of the nineteenth century, idealism of an essentially absolute kind became the dominant mode of philosophy in the UK and the USA (where, however, there were more serious rivals to it). This was motivated partly by the search for a form of religious belief which would be less vulnerable to Lyell and Darwin than traditional Christianity had been, and by an ethical viewpoint which would be rather nobler in its conception of the possibilities of human life than Benthamite utilitarianism. Some of these philosophers (for example John and Edward Caird, and William Wallace), were doctrinal Hegelians, utilizing Hegelianism to save Christianity.

More importantly original philosophers of an idealist persuasion during this period were T.H. Green and F.H. Bradley in the UK (also the very like-minded, though more Hegelian, Bernard Bosanquet), and Josiah Royce in the USA. We can only mention in passing the very distinctive idealism already advanced by J.F. Ferrier in Scotland, which draws both on Berkeley and on German idealism. These thinkers were to various extents influenced by Kant and Hegel and the other German idealists, but in the case of Bradley, at least, something of the Berkeleian tradition is, perhaps unconsciously, present.

Green was anxious above all to show that the development of human life from animal origins could not be explained purely by way of natural selection, or indeed in any naturalistic way. Rather, must it be recognized as the gradual unfolding of the life of a universal spirit aspiring to fulfilment in an eventually virtuous form of human life. For empiricism and naturalism cannot explain the connectedness of the world, and the ability of the human mind to synthesize events of different times into a unitary history. This is only possible if the world is the expression of a single universal spirit of which each of us is an actualization in which it becomes aware of itself.

The general upshot is quite Hegelian, but there is little use of Hegelian dialectic.

Bradley's metaphysics derives from two main reflections: first, that nothing is genuinely conceivable except experience with its various modes and contents; second, that what we describe as distinct things in relation to each other can only be adequately conceived as abstractions from a higher unity. In the end all things must, therefore, be abstractions from one single Cosmic Experience. With his denial of time's reality and his claim that Reality is really a single cosmic *Nunc Stans* whose ingredients only seem to be passing away in time, Bradley strikes a note which is perhaps more Platonic than Hegelian. Royce's absolute idealism has a good deal in common with Bradley, but whereas for Bradley God was only a rather superior 'appearance' along with the ordinary things of daily life, for Royce the Absolute was God, being personal in a way that Bradley's Absolute was not.

6 Panpsychism

One of the main charges against idealism is that of 'cosmic impiety' (Santayana). Its tendency is to make the vast realm of nature simply a representation in a mind observing or thinking of it. This can hardly do justice either to its obstinacy (surely not primarily of our own making, whatever Fichte may have thought) or to its wonderfulness. Such reflections have led some of those who are persuaded of the basic idealist claim that unexperienced reality is impossible, to hold the panpsychist position that nature is composed of units which feel their own existence and relation to other things, just as truly, if less articulately, as we do (see Panpsychism). This was the view of Royce, and Bradley thought it might be true. It was a main plank, somewhat eccentrically developed, of the German idealist Gustav Fechner (and is perhaps adumbrated in Schelling); also of Leibniz, who in this respect can be called an idealist.

Panpsychism of this sort has been most fully developed in recent times in the work of A.N. Whitehead and of Charles Hartshorne. It is sometimes regarded as a synthesis of realism and idealism; realist because it gives the ultimate units of nature (whatever they are) a reality in themselves (as what they are for themselves); idealist because it denies unexperienced reality. When the inner sentient life of (the rest of) nature is thought of as unified with the subjective life of humans and animals (as it must be for a Bradley or a Royce) in one absolute consciousness, we have a form of absolute or objective idealism which quite avoids the anthropocentric character it had in the work of thinkers such as Fichte.

7 Personal idealism

Many thinkers of an idealist persuasion in the English-speaking world bridled somewhat at the downplaying of individual persons by absolute idealism, especially Bradley and to a lesser extent Royce. This led to the development, as the nineteenth century closed, of some forms of personal idealism for which reality is a community of independently real spirits (with or without a God as a *primus inter pares*) and the physical world their common object or construction. There is no great figure here, with the possible exception of J.M.E. McTaggart who espoused a highly individual form of pluralistic idealism. Otherwise the main proponent of personal idealism was the US philosopher, G.H. Howison, although eight Oxford philosophers published a manifesto under this label in 1902 (see Personalism).

Anglo-American idealism was, for a time, widely thought to have been refuted by the work of G.E. Moore and Bertrand Russell in the UK and such pragmatists as James and Dewey in the USA (though there were certainly idealist features to the thought of these two Americans), but a contrary judgement is now not uncommon. Edmund Husserl's phenomenology remains influential in some quarters, and some agree with his eventual view that it implies a form of transcendental idealism (see Husserl, E.). Some regard the antirealism associated with Michael Dummett as idealist in spirit (see Realism and antirealism), while some of the continuing school of Wittgensteinians regard the thought of Wittgenstein as a form of social idealism. Much closer to traditional idealism, however, is the conceptual idealism of the important US philosopher Nicholas Rescher (which synthesizes idealism and pragmatism) and idealist positions (not, it must be admitted, so far very influential) advocated in the UK by John Foster and, if he may say so, by the author of this entry.

Idealizations

Scientific analyses of particular phenomena are invariably simplified or idealized. The universe does not contain only two bodies as assumed in Newton's derivation of Kepler's laws, or only one body as assumed in Schwarzschild's relativistic update; real economic agents do not act exclusively to maximize expected utilities, the surfaces of ordinary plate condensers are not infinitely extended planes, and the sine of an angle is not equal in measure to the angle itself. There are many reasons for the use of such misdescriptions. First and foremost is the need to achieve mathematical tractability. Science gets nowhere unless numbers, or numerical constraints, are produced that can form the basis of predictions and explanations. Idealizations may also be required because of the unavailability of certain data or because of the absence of necessary auxiliary theories.

The philosophical problem is to make normative sense of this common but complex scientific practice. For example, how can theories be tested given that they connect to the world only through the intermediary of idealized descriptions? In what sense can there be scientific explanations if what is to be explained must be misdescribed before theory can be brought to bear? The fact that idealizations can often be improved, with corresponding salutary effect on the accuracy of prediction or usefulness of explanation, suggests that idealizations should be understood as part of some sort of convergent process.

1 The falsity of idealizations

Idealizations are false. This much is clear. And not only false, but such that their use, by and large, must lead to incorrect observational consequences. In order to generate a numerical prediction, Michelson and Morley described their interferometer as being perfectly rigid and the optical media as being stable, even though they knew this not to be true. The example is not an isolated exception. This causes serious problems for conventional hypothetico-deductive and Bayesian views of theory confirmation (see Confirmation theory). Let *t* represent some underlying or fundamental theory, *i* the idealizing assumptions made, and *p* some actually derivable prediction. Philosophical and scientific common sense has it that if *p* is found to be true there is confirmation, or at least the satisfaction of a necessary condition for confirmation, and if *p* is found to be false, disconfirmation. But the falsity of *i* blocks such inferences. Consider first disconfirmation. From the premises $t\&i \Rightarrow p$ and $\sim p$ all that follows is that $\sim (t\&i)$, which is equivalent to $\sim t \vee \sim i$ (that is, not *t* and/or not *i*). But this conclusion follows directly from the falsity of *i*. Therefore, there is no need to engage in the expense of experimentation if the conclusion sought is simply that either theory or idealizations are false. A similar problem holds for confirmation.

Bayesian accounts fare no better. Distinguishing, as above, between the underlying theory and the idealizations needed for an actual calculation, Bayes' theorem takes the form,

$$\mathrm{P}(t \;\&\; i \mid e) = \frac{\mathrm{P}(e|t \;\&\; i)\mathrm{P}(t \;\&\; i)}{\mathrm{P}(e)}$$

where *e* represents the empirical evidence. Because the idealizations are false, $\mathrm{P}(t \;\&\; i) = 0$. Therefore, the evidence cannot affect the probability of $(t \;\&\; i)$. This is just the Bayesian analogue of the problem caused by the use of idealizations for hypothetico-deductivism. Consider also the typical case in science where the theory-produced prediction is false because of the distortion introduced by the idealizations. In such a case $\mathrm{P}(e \mid t\&i)$ will be zero. So once again, there will be no change in the probability of $(t \;\&\; i)$. Trying to avoid such difficulties by separating *i* from *t* and conjoining it with *e* leads to similar disappointments for Bayesians.

2 Idealizations as approximations

One popular approach to idealizations is to view their use as a form of approximation. The basic idea is to think of individual idealizations as elements of some larger structure that is convergent on the truth. This way of thinking is naturally inspired by the existence in science of sequences, such as the following, of increasingly less idealized descriptive equations.

$$to\mathrm{ml}^2 \frac{\mathrm{d}^2\theta}{\mathrm{d}t^2} = -mgl\theta(1) ml^2 \frac{\mathrm{d}^2\theta}{\mathrm{d}t^2} = -mgl\sin\theta(2) ml^2 \frac{\mathrm{d}^2\theta}{\mathrm{d}t^2} = -cl\frac{\mathrm{d}\theta}{\mathrm{d}t} - mgl\sin\theta(3)$$

These equations apply to simple pendulums where *m* is the mass of the pendulum bob, *l* the length of the suspension cord, *g* the gravitational strength, *c* the coefficient of resistance, and the angular displacement. A

natural ordering exists insofar as (3) approaches (2) as the coefficient of resistance is made to approach zero, and (2) reduces to (1) if $\sin\theta$ is replaced by . Focusing first on the reduction of (2) to (1), the difference between $\sin\theta$ and will be ‘small’ if is itself ‘small’. For example, if is 0.0873 radian, then $\sin\theta$ is 0.0872. And in general, as approaches zero the difference between $\sin\theta$ and also approaches zero. The hope therefore is that if is kept small, the difference in the solution to (1) will differ from that of (2) by a correspondingly small amount. And because this hope is satisfied, it can be said that approximates $\sin\theta$. The relationship between (2) and (3) is similar: if the coefficient of resistance *c* is small, then so too, one hopes, will be the difference between calculated periods. What is illustrated in these equations is a transformational sense of approximation: the substitution of some term or expression X' for *X* in a mathematical function or equation, where the effect of the transformation will be correspondingly small if the difference between *X* and X' is small. And if the transformations are made in the appropriate order, a sequence such as that illustrated is formed of increasingly less idealized and more realistic descriptive equations.

The above approach distinguishes between the process of idealization, the misdescription of things, and the hope that this misdescription will yield a successful transformational approximation. In the case of equation (2), the natural inclination is to say that a causal factor has been ignored or misdescribed, namely, the resistance. Examples such as this suggest that idealization involves the deliberate ignoring or misdescription of causally relevant factors. Whether or not such misdescriptions can be interpreted as yielding transformational approximations becomes a separate mathematical question. But as the approximation of $\sin\theta$ by suggests, there may be cases where the process of idealization seems motivated by exclusively mathematical considerations. It must also be kept in mind that the closeness of an original quantity and its idealized surrogate is by itself no guarantee that functional outputs or solutions will be correspondingly close. The specifics of the mathematics involved must be examined in order to determine whether closeness is preserved.

The construction of sequences that are increasingly less idealized is a major challenge for science. The pendulum example also illustrates an important experimental challenge. And that is the construction and development of experiments that more closely approach existing idealized analyses. So, for example, assuming the correctness of (3), eliminating the resistance and keeping the oscillations small is a way of making an actual pendulum approach its counterfactual cousins. There are two responses therefore that typically are made to the use of idealizations. First, one can try to bring the analysis to the phenomenon by making the analysis less idealized. Second, one can try to bring the phenomenon to the description by experimental refinement.

3 Monotonically convergent sequences and targets of approximation

In the case of the pendulum the identification of with $\sin\theta$ and the substitution of zero for resistance could be readily interpreted as transformational approximations because equation (3) served as a reference or target. But where do such targets come from? How completely need they be specified in order to determine that some idealization is a transformational approximation? Is the apparent convergence of a sequence of idealized analyses a reliable indication that a target exists? In order to appreciate the difficulties such questions pose, imagine that *t* is the true fundamental theory applicable in some domain of interest, and that there exists a sequence of input conditions and their idealizations $\langle i_1, \ldots, i_i, \ldots\rangle$ such that $t(\langle i_1, \ldots, i_i, \ldots\rangle)$ is convergent on the actual effect. (Henceforth, the sequence will be denoted $\langle i_i\rangle$, and functional application as $t\langle i_i\rangle$.) So, for example, imagine that there are one hundred forces, f_1 through f_{100}, all aligned along a common axis, operating on some particle. And let the first ninety-nine be of equal magnitude but alternating direction, and the remaining force be twice the magnitude of the others. Now imagine that scientist *S* arrives on the scene, gradually learns of the existence of the forces in the sequence $\langle f_1, f_2, \ldots, f_1, f_{i+1}\rangle$, and applies standard Newtonian theory, that the acceleration of the particle will be equal to the product of its mass and the vectorial sum of the forces. (The complications that would result if *S* were to use idealized descriptions of the forces will be ignored.) The resultant summations can naturally be described as becoming increasingly more realistic and less idealized. *S*’s ongoing efforts, however, will be to little avail because improving things this way does not result in the gradual convergence of prediction to actual acceleration. Convergence occurs all at once when the enumeration is complete. The target becomes clear only once one has arrived and it is known that one has arrived. It must be known that the enumeration is complete. That $t\langle i_i\rangle$ is convergent is by itself not of much value because all that is assured is that if *S* works long enough, experimental fit will get better and remain so. But how long is long enough is not specified; only that there exists at least one such point. Consider the consequences of this observation for the testing of scientific theories. Say, for

example, that *S* wishes to test whether the underlying Newtonian theory is true. Failure to achieve improvement of experimental fit by the use of increasingly more realistic idealizations would not be evidence of its falsity. By contrast, assume the existence of a world where the input can be ordered such that $t\langle i_i \rangle$ is strictly monotonic (that is, predictive output is always getting better). In such a world, the use of *t* would be rewarded by constantly improving experimental fit as increasingly more realistic idealizations were employed - assuming, of course, that the appropriate input sequence is employed. If such continual improvement did not occur, then it would be known that the theory was not correct. So in a situation where strict monotonicity holds, disconfirmation is possible and the use of a correct theory will be rewarded in the sense that experimental fit will continually improve as increasingly more realistic idealizations are used. But only on the assumption that one has access to the strictly monotonic sequence of input conditions. How, though, is this to be assured? Or that such a sequence even exists? It is hard to see how such determinations could be made without assuming the truth of the very theory to be tested. Say, for example, that it is discovered that *t* and some set of idealizations, i_1, yield more accurate predictions than the combination of *t* and some other set i_2 of idealizations. Presumably, this lends some support for i_1 being placed later in the sequence than i_2. Such an appraisal, however, relies on the assumption that *t* is true. If so, then it is the idealizations that are being tested by means of experiment and not the theory itself! So it looks as though theories can be tested if it is assumed that idealizations are monotonically ordered, and idealizations can be ordered if the corresponding theory is assumed. But there seems no way to test experimentally both theory and idealizations.

One proposal for avoiding this result is to employ some sort of bootstrapping procedure. Briefly, the idea is to begin the confirmational process by using the theory along with experimentation to tentatively order the idealizations used in some particular domain of application. Attention is then shifted to a different domain or experimental situation, but it must be one that is not so different that the previously obtained measures of relative realism will not be expected to hold. If the new theoretical predictions do not retain the ordering of the original domain (assuming appropriate compensation can somehow be made for relevant differences), then suspicion is cast on the theory. So, for example, predictions of pendulum period are more accurate when hydrostatic effects are taken into account. This superiority is expected to continue in the case of compound pendulums. Sometimes enough is known about the interfering causes and the mathematical properties of possible idealizations that it can be formally shown that monotonically convergent sequences cannot exist for the theory in question. For example, with respect to the kinetic theory of gases, it was shown that the equipartition theorem entailed that making molecule descriptions more realistic (by adding more degrees of freedom) would lead to predicted values for specific heats that would be progressively worse than those predicted on the basis of simple models.

4 Developments and consequences

Systematic development of the themes presented above has proceeded along a broad front. Much effort has been expended to develop abstract but mathematically precise ways of characterizing scientific theories that will take into account idealizations and approximations. One of the anticipated benefits of such characterizations is being able to analyse theories themselves as idealizations or approximations of other theories. There has also been considerable formal development of appropriate measures for nearness or closeness of fit. The choice of such measures becomes problematic when more is involved than simply determining how far one number is from another and there are multiple criteria for successful fit. Another line of investigation involves understanding the scientific use of idealizations and approximations in terms of more general notions of computation. It has long been believed that there is a fruitful analogy to be developed between the development of science and finding equational solutions by means of successive approximations. Other subjects of active investigation include the differences between the uses of idealizations in the pure and applied sciences, the relevance of the use of idealizations for the debate among realists and instrumentalists (see Scientific realism and antirealism), and the importance of non-linear dynamics (see Chaos theory) for understanding the successful use of idealizations and approximations.

Ideals

Ideals are models of excellence. They can be moral or nonmoral, and either 'substantive' or 'deliberative'. Substantive ideals present models of excellence against which things in a relevant class can be assessed, such as models of the just society or the good person. Deliberative ideals present models of excellent deliberation, leading to correct or warranted ethical conclusions. Ideals figure in ethics in two opposed ways. Most centrally, ideals serve to justify ethical judgments and to guide people in how to live. Sometimes, however, ideals may conflict with moral demands, thereby testing the limits of morality.

Reliance upon ideals in the development of ethical theories seems unavoidable but raises difficult questions. How can the choice of a particular ideal be justified? How might conflicts between ideals and other values, especially moral demands, be resolved?

1 Substantive and deliberative ideals

Substantive ideals delineate the features that something or someone must possess in order to be excellent in a specific regard. Such ideals can provide a highly detailed model or a more general framework. Whether specific or general, however, substantive ideals logically imply certain evaluative judgments in conjunction with the facts about whether and to what degree something or someone possesses the relevant features. A person can hold universal ideals of human excellence or human social life, as well as more personal ideals regarding who to be and how to live. Common universal ideals include ideals of the just or virtuous person, ideals of human rationality, the liberal ideal of a free society, and hierarchical ideals of societies structured to realize human excellence. Prevalent personal ideals include those of being an exceptional parent, a connoisseur of high culture, a brave soldier or a devout follower of God.

Substantive ideals provide standards that guide the development of character and commitments, aims and attitudes, social relationships and institutions. When persons hold an ideal of human excellence, for instance, they regard it as central to their identity. They are normally motivated to cultivate the emotions, qualities and pursuits their ideal upholds, and they feel shame, guilt or self-contempt when they fail to live up to their ideal. To hold an ideal thus differs from merely wanting or preferring something. Because ideals provide a basis for assessment, holding an ideal is more akin to having a second-order desire, a desire to have or not to have certain other desires.

Each moral system or theory has its corresponding ideals, but whether each actually derives from an ideal is a matter of some controversy. Nevertheless, substantive ideals have historically been central to many different moral conceptions. In his *Republic*, Plato famously constructs a blueprint of the just state (see Plato §14). Aristotle's account of human happiness in *Nicomachean Ethics* rests upon a substantive ideal of excellent human functioning (see Aristotle §§22-7). G.E. Moore, in *Principia Ethica* (1903), presents an account of 'the Absolute Good or Ideal', which is made up of the intrinsic goods of personal affections and aesthetic enjoyments (see Moore, G.E. §1). Other important substantive ideals include Kant's 'kingdom of ends' (1785), an ideal union between self-legislating rational beings (see Kant, I. §§9-10; Kantian ethics); Nietzsche's ideal of the 'overman' (*Übermensch*) (1883-5), the creative, self-determining man who lives without fear of himself or others (see Nietzsche, F. §10); and John Rawls' Kantian ideal of the person (1980) (see Rawls, J.).

Substantive ideals continue to be important to ethical theorizing. But philosophers in the twentieth century have largely avoided explicit appeal to substantive ideals, perhaps in recognition of the apparent plurality of defensible values (see Moral pluralism; Values). Instead, they often rely on deliberative ideals, seeking to develop a critical perspective on our ordinary desires and ethical assessments that is sensitive to value pluralism.

Deliberative ideals specify optimal conditions for reflection on ethical questions. They form the basis of broadly counterfactual accounts of moral and nonmoral value, most notably, in 'ideal observer' theories and contractarian theories. The deliberative ideals developed in contractarian theories figure critically in attempted derivations of principles of justice or morality. But as employed in ideal observer theories, deliberative ideals do not logically support evaluative conclusions: evaluative conclusions are determined by an observer's reactions - usually some sort of 'pro' or 'con' attitude - under ideal conditions. In either case, though, deliberative ideals function to justify ethical conclusions by incorporating conditions designed to ensure both that a deliberator's conclusions or

reactions have been subjected to rational, critical scrutiny and that they address the concerns of actual deliberators. Conditions are thereby also designed to preserve the recommending force of ethical judgments and the connection that normally holds between ethical judgment and motivation (see Moral motivation §1). Deliberative ideals typically enhance the rationality of deliberators and either markedly increase or relevantly constrain their knowledge. They may also improve a deliberator's motivations, for instance, by eliminating emotional distortions (see Morality and emotions §1).

Deliberative ideals are sometimes offered as analyses or reforming definitions of ethical terms. The paradigm ideal observer theory, developed by Roderick Firth (1952), analyses the meanings of ethical words in terms of the 'ethically significant reactions' of an ideal observer, one who is disinterested, dispassionate, omniscient, omnipercipient, consistent and 'otherwise normal'. Certain ethical naturalists, notably Richard Brandt (1979) and Peter Railton (1986), have offered structurally similar 'reforming definitions' of ethical terms. And R.M. Hare's account of 'critical thinking', based on the 'logic' of the moral concepts, parallels Firth's view in many respects (see Hare, R.M. §3).

John Rawls' account of the 'original position', in *A Theory of Justice* (1971), is perhaps the most famous contractarian deliberative ideal. According to Rawls, fair choice of principles of justice occurs when rational, self-interested, mutually disinterested persons select principles under conditions of limited shared information from behind a 'veil of ignorance'. Deliberative ideals related to Rawls' can be found in the contractarian views of Thomas Scanlon (1982) and David Gauthier (1986), for example, as well as in Jürgen Habermas' 'discourse ethics' (1990) (see Rawls, J.; Contractarianism §9; Habermas, J. §3).

Deliberative ideals are often thought to avoid substantive evaluative commitments, at least controversial ones. Certain deliberative ideals, however, may reflect substantive ideals, as the deliberative ideal embodied in Rawls' original position reflects his Kantian ideal of the person. Thus, deliberative ideals may not be fully distinct from substantive ideals.

2 Selecting ideals

Given the important justificatory role of ideals in ethical theories, how might choice of a particular substantive or deliberative ideal be justified? Various answers have been given, each of which encounters difficulties.

Plato held that knowledge of the Forms of Goodness and Justice is innate and recovered through a process of recollection. But such claims regarding innate knowledge seem contradicted by ethical disagreement. We might, following Aristotle, look to human nature to support choice of ideals (see Human nature §1). But we lack a convincing account of human nature, and the evident diversity of human talents and reasonable aims suggests that human nature will not support any single ideal. Moore determines the content of 'the Ideal' by considering items in complete isolation in order to ascertain their intrinsic value. This 'method of isolation', however, assumes implausibly that we can directly intuit an item's value. Firth claims to select the characteristics of an ideal observer 'by examining the procedures which we actually regard, implicitly or explicitly, as the rational ones for *deciding* ethical questions' (1952: 332; original emphasis). But our ordinary view of which procedures are rational may be faulty and less determinate than Firth supposes. Brandt's and Railton's reforming definitions incorporate purely epistemic ideal conditions, thereby apparently remaining neutral as between substantive ideals and desires. Yet conditions that are only epistemically ideal may lack normative force. For the reactions individuals would have under such conditions will depend, in part, on their own motivational systems, which may themselves warrant normative criticism. Finally, Rawls argues that his original position incorporates only weak and widely shared assumptions about what makes for a fair choice. Critics of Rawls have argued, however, that his assumptions are controversial.

Choice between ideals used to support competing conceptions of moral and nonmoral value can be settled to some degree by considering such things as the relative coherence and consistency of the ideals, as well as their compatibility with empirical information. But as Samuel Scheffler regretfully remarks, there may be no 'ideal-independent, trans-theoretical moral perspective which condemns the ideal we abhor and favours the ideal we prize' (1979: 300) (see Moral scepticism).

3 Ideals and morality

In some cases, conflicts may arise between a person's ideals (moral or nonmoral) and other values, in particular, alleged moral obligations (see Duty). These conflicts reveal important questions about the divide between morality and nonmoral value and about what limits may exist to the demands of morality.

Bernard Williams has considered such conflicts (1973), arguing that utilitarianism in particular and impartial morality more generally may be destructive of individual integrity, since they demand that persons set aside their deepest commitments in favour of what morality may require (see Impartiality; Williams, B.A.O. §2). Williams does not use the language of ideals, but the commitments which give individuals a sense of what their lives are about will surely include commitments to particular ideals. The conflicts examined by Williams expose difficult questions about morality. Is it purely impartial or does it include 'agent-centred prerogatives' (Scheffler 1982)? If morality is purely impartial, are its demands always overriding? In answering these questions, we see how ideals may function not only to ground morality, but to fix its contours and limit its demands.

Identity

Anything whatsoever has the relation of identity to itself, and to nothing else. Things are identical if they are one thing, not two. We can refute the claim that they are identical if we can find a property of one that is not simultaneously a property of the other. The concept of identity is fundamental to logic. Without it, counting would be impossible, for we could not distinguish in principle between counting one thing twice and counting two different things. When we have acquired the concept, it can still be difficult to make this distinction in practice. Misjudgments of identity are possible because one thing can be presented in many guises.

Identity judgments often involve assumptions about the nature of things. The identity of the present mature tree with the past sapling implies persistence through change. The non-identity of the actual child of one couple with the hypothetical child of a different couple is implied by the claim that ancestry is an essential property. Knowledge of what directions are involves knowledge that parallel lines have identical directions. Many controversies over identity concern the nature of the things in question. Others concern challenges to the orthodox conception just sketched of identity itself.

1 Exposition of a popular view

Identity is the relation that, necessarily, each thing has to itself and to nothing else. Thus Constantinople has the identity relation to Istanbul because Constantinople *is* Istanbul, the very same city. This relation is often called 'numerical' identity, to distinguish it from 'qualitative' identity, the relation of exact similarity. Although 'identical' twins might be qualitatively identical, they are not numerically identical, for there are two of them, not one. The formula '$x = y$' says that *x* and *y* are (numerically) identical.

Identity is governed by two basic logical principles, reflexivity and Leibniz's Law (see Leibniz, G.W. §11). To say that the identity relation is reflexive is to say that for each thing *x*, $x = x$. Leibniz's Law says that if $x = y$ then whatever is true of *x* is also true of *y*; it is used in arguments such as 'Jack the Ripper was in Whitechapel last night, the Prince of Wales was not in Whitechapel last night; therefore Jack the Ripper is not the Prince of Wales'. Leibniz (1704) was not the first to formulate this law, which was known in antiquity. It is sometimes called the 'indiscernibility of identicals', not to be confused with Leibniz's principle of the 'identity of indiscernibles', a kind of converse, which says (implausibly) that qualitative identity implies numerical identity (see Identity of indiscernibles). Reflexivity and Leibniz's Law characterize identity uniquely: it is provably impossible for two non-equivalent relations to satisfy both principles. The two principles also entail that identity is symmetric (if $x = y$ then $y = x$) and transitive (if $x = y$ and $y = z$ then $x = z$).

If $a = b$, Leibniz's Law says that whatever is true of *a* is true of *b*. However, this permits the replacement of '*a*' by '*b*' only in contexts in which the expressions merely specify which thing is being talked about. For example, it is invalid to argue from 'Jocasta = the mother of Oedipus' and 'Oedipus knows that he married Jocasta' to 'Oedipus knows that he married the mother of Oedipus', for here 'the mother of Oedipus' does not merely specify a person; it specifies the description under which Oedipus is said to know that he married her (see Propositional attitudes). Looking at photographs of a mature tree and a sapling, one cannot use Leibniz's Law to refute the hypothesis 'The mature tree = the sapling' on the grounds that 'The mature tree is tall' is true and 'The sapling is tall' is false. The noun phrases 'the mature tree' and 'the sapling' do not merely specify trees; they indicate the times with respect to which tallness is predicated. A correct understanding of Leibniz's Law is needed if identity through change is not to seem contradictory.

A genuine consequence of Leibniz's Law is the necessity of identity: things that are in fact identical could not have been distinct (see Modal logic, philosophical issues in §4). For suppose that $x = y$. Since *x* could not have been distinct from itself, *x* could not have been distinct from *y*. Thus *x* and *y* cannot be contingently identical: they must be identical in all circumstances. A more complex argument concludes that they cannot be contingently distinct. They are either necessarily identical or necessarily distinct. Consequently, they are either always identical or always distinct. For example, if my headache is identical with an event in my brain, then that headache has to be that event; neither could exist without the other. Of course, a sentence such as 'Rome = the capital of Italy' is contingently true, but that is because the description 'the capital of Italy' need not have specified the city it actually specifies. The example is consistent with the necessity of identity, however, for it does not imply that one

city could have been each of two.

An argument like that for the necessity of identity can be used to refute the idea that questions of identity need have no right answer. For example, it is sometimes held to be indeterminate whether a given mass of rock and ice is Everest (see Vagueness §1). However, it is determinate whether Everest is Everest. If Leibniz's Law and ordinary logic apply in this context, it follows that Everest is distinct from that mass, and the identity question has a right answer - a negative one. Thus the hypothesis of indeterminacy contradicts itself.

Statements of identity in natural languages often include a noun answering the question 'same what?', for example, 'Istanbul is the same city as Constantinople'. Since identity is uniquely characterized by its logic, the role of the noun is not to disambiguate 'same'; '*a* is the same *F* as *b*' is equivalent to '*a* is an *F* and $a = b$' (from which '*b* is an *F*' follows by Leibniz's Law). Identity is not defined kind by kind. Rather, we use the pregiven notion of identity in defining kinds. For example, we explain the difference between rivers and collections of water molecules by saying that the same river contains different collections of water molecules at different times.

A 'criterion of identity' for a kind is a necessary and sufficient condition for members of the kind to be identical. Frege's criterion of identity for directions is that the directions of lines are identical if and only if the lines are parallel (1884). The criterion of identity for numbers is that the number of *F* things is the number of *G* things if and only if there is a one-to-one correlation between the *F* things and the *G* things. In such cases, members of the kind can be presented in various guises: directions as the directions of various lines; numbers as the numbers of various pluralities. The criterion of identity states the condition for two guises to be guises of one member of the kind. Without a grasp of these conditions, one would not know what directions or numbers were.

A criterion of identity for a spatiotemporal kind is expected to give the condition for a member of the kind at one place and time to be identical with a member of the kind at another place and time: for example, it may have to follow a continuous trajectory between these space-time points. An account may also be required of an object's identity across hypothetical circumstances. For example, one may hold that a member of the kind could not have originated at different places and times in different possible worlds. Spatiotemporal objects can be exactly similar without being identical, for they can originate at different times or places. In contrast, purely abstract objects cannot be exactly similar without being identical.

2 Alternatives

Every aspect of the preceding view has been questioned. Although it is popular, the philosophers who accept it all may be in a minority.

That identity is a relation has been denied, both on metaphysical grounds (it cannot relate two things) and on grammatical grounds (some assimilate 'is' in 'Constantinople is Istanbul' to the 'is' of predication as in 'Constantinople is crowded'). However, the logic of 'Čequals;' does single out a unique class of ordered pairs of objects to which it applies, which suffices to make identity a relation in some minimal sense.

The contrast between identity and indiscernibility has been challenged, on the grounds that indiscernibles satisfy the same descriptions and since *a* satisfies the description 'identical with *a*', so does anything indiscernible from *a*. The obvious reply is that indiscernibles merely satisfy the same *intrinsic* descriptions, but it is hard to explain what 'intrinsicness' is.

Many applications of Leibniz's Law are problematic. Some deny its applicability to contexts that treat non-actual possibilities or even non-present times, thus excluding the derivation of the necessity or permanence of identity. The intention is, for example, to permit a pot to be contingently identical with the clay of which it is made, or the clay to be temporarily identical with the pot. One question is whether the envisaged restrictions on Leibniz's Law are *ad hoc*. They would not be if so-called identity between objects in different possible worlds or at different times could not be taken at face value but was somehow reducible to relations of qualitative similarity among counterpart objects each of which was confined to a single possible world or time. Such views have been supported by appeal to the difficulty of specifying what is essential to an object, for example, to what extent a particular ship could originally have been made from different planks of wood, or how much it could change without ceasing to exist. However, the proposed reductions are both complex and hard to reconcile with ordinary assumptions about the nature of everyday objects.

Identity has also been regarded as sometimes indeterminate. Although it is usually conceded that if things are identical then it is determinate whether they are identical, in some nonstandard logics it does not follow that if it is indeterminate whether they are identical then they are not identical. Such logics postulate an intermediate status that propositions can have between truth and falsity. One challenge to this view is to explain what it means for a proposition to be not true without being false.

Yet another nonstandard view is the doctrine that identity is always relative to an answer to the question ‘same what?’. For example, if *a* and *b* are copies of *Middlemarch*, this view disputes the inference from ‘*a* is the same edition as *b*’ and ‘*a* is a copy’ to ‘*a* is the same copy as *b*’. The relation of being the same edition will not satisfy Leibniz’s Law unrestrictedly, but the view needs to show that no other relation (for example, being the same copy) could satisfy Leibniz’s Law unrestrictedly, for such a relation would be a case of non-relative identity.

Many disputes about criteria of identity for particular kinds of entity (see Personal identity) concern the nature of those entities, not of identity itself. But even the concept of a criterion of identity is itself problematic. For example, can one give an adequate criterion of identity for events by saying that events are identical if and only if they have the same causes and effects? The problem is that the causes and effects of events include other events. The criterion is in some sense circular, but it is hard to state the requirement of non-circularity clearly. Even if that could be done, it is unclear why every kind of object should have a non-circular criterion of identity. There may be nothing more basic than identity to which identity could be reduced. The standard logic of identity demands no such reduction.

Perhaps identity will come to be regarded as a logical constant, no more problematic than, say, conjunction. If so, many of the issues mentioned above will remain difficult, but their difficulty will concern the nature of various kinds of object, not the relation of identity.

Identity of indiscernibles

The principle of the identity of indiscernibles states that objects which are alike in all respects are identical. It is sometimes called Leibniz's Law. This name is also frequently used for the converse principle, the indiscernibility of identicals, that objects which are identical are alike in all respects. Both principles together are sometimes taken to define the concept of identity. Unlike the indiscernibility of identicals, which is widely accepted as a logical truth, the identity of indiscernibles principle has frequently been doubted and rejected. The principle is susceptible of more precise formulation in a number of ways, some more dubitable than others.

1 Leibniz's principle

In his metaphysics, Leibniz frequently stated a principle that no two separate individual things could differ only numerically, that is, resemble one another in all their properties or 'intrinsic denominations' and yet not be one and the same thing. According to various scholastics, two things may differ merely numerically, meaning they could have the same nature, but be distinguished by their matter. Immaterial individuals such as angels must each have a distinct nature, and Leibniz, rejecting matter, extended this view to all individuals. Sometimes he justified it theologically: God never does anything without a reason, and if two things were exactly alike, he would have no reason to create one rather than the other. Sometimes Leibniz referred to empirical evidence, recounting the story of the nobleman he set vainly to searching a castle garden to find two leaves exactly alike, though of course the mere failure to find a counter-instance on a restricted search is no serious test. Leibniz used his principle to argue against empty space and time.

In his logical writings Leibniz defined a relation of sameness between terms as follows: 'Terms which can be substituted for one another whenever we please without changing the truth of any statement (*salva veritate*), are the same (*eadem*) or coincident (*coincidentia*)'. When terms are coincident they denote the same thing or things. Leibniz's definition covers general as well as singular terms, as his triangle/trilateral example makes clear. It would perhaps be better to say that the things are the same when their names are coincident, but Leibniz's meaning is clear.

Leibniz's definition of identity was adopted by Frege, who restricted it to singular terms. In second-order predicate logic, singular identity is often defined as follows:

$$a = b \equiv_{\mathrm{Df.}} \forall \mathrm{F}(\mathrm{F}(\mathrm{a}) \equiv \mathrm{F}(\mathrm{b})).$$

The left-to-right implication is uncontroversial, but needs careful formulation to exclude non-extensional contexts. For example, in 'John believes that *x* defeated Mark Antony', substituting the names 'Octavian' and 'Augustus' for *x* may yield different truth-values if John does not realize that Augustus and Octavian are the same person, yet his ignorance does not impugn their identity (see Propositional attitudes). *F* is taken to range over properties or predicate extensions determined by extensional sentential contexts only. It is thus important to distinguish the substitution principle, which is about expressions, and requires such restrictions, from the indiscernibility principle, which is about the properties of individuals (see Identity §1).

It is the right-to-left implication that is the modern symbolic form of Leibniz's identity of indiscernibles, and this is the half of the definition that has attracted most criticism. There is a version of the principle which is trivially true. Assume $\forall F(F(a) \equiv F(b))$. Substituting '$a = x$' for '$F(x)$' we have $(a = a) \equiv (a = b)$, and since it is logically true that $a = a$, it follows that $a = b$.

Leibniz hardly intended his principle to be understood thus: had it been a logical triviality, he would not have laboured it; indeed he did not consider it a logical truth. This version of the principle is not in doubt. To rescue it from triviality and make it fit to define identity, we must screen off identity and all properties involving it from consideration. Call properties that pass the supposed screening-off test 'material' properties. The most obvious material properties are qualities, so a more substantive version says that no two distinct individuals have all their qualities in common. This is closer to Leibniz's intentions, but readily refuted. For very simple and numerous individuals such as fundamental particles the qualities attributable to them are few, and it is unlikely that two such particles are never exactly alike with respect to the few qualities they do have.

Even allowing that a particle has a history and may change its qualities, we cannot exclude the possibility of two particles having exactly similar qualitative histories. Even if two things never in fact resemble one another exactly, it is not logically impossible that two distinct things be exactly alike. So the qualitative version of the principle seems clearly false.

2 Temporal and modal versions

Evidently there are several indiscernibility principles, differing in plausibility. The question becomes: which one is neither so weak that it is trivial nor so strong that it is false, but just strong enough to characterize identity?

Two objects may be 'temporarily' indiscernible and yet be distinct because they are discernible at some other time. A golden cup and the gold out of which it is made occupy the same place, have the same weight, thermal conductivity, stand in the same spatial and causal relations to other contemporaneous things, and so on. But the gold existed before the cup was fashioned out of it.

Suppose two objects came into being simultaneously and have been always indiscernible to date. Are they identical? Not if their histories diverge later. If a cat *C* and the mereological sum of its body and tail $B+T$ have been indiscernible until now, but later the cat loses its tail, then the histories of *C* and $B+T$ diverge, for *C* loses *T* as a part but $B+T$ does not (it either becomes scattered or ceases to exist), so *C* was not identical with $B+T$: they were merely indiscernible prior to the loss of the tail. The property by which they differed was future-related, just as the history of the gold before it came to constitute the cup is past-related.

Neither temporary indiscernibility nor indiscernibility to date suffice for identity, but if individuals are 'permanently' indiscernible, that is, exist and have the same properties at the same times, are they identical? It seems not. For suppose *C* never loses its tail. *C* remains coincident and indiscernible from $B+T$ at all times it exists. But *C*, unlike $B+T$, could have lost *T* and carried on existing: cats, unlike body-tail sums, can exist without tails. So it seems that *C* is 'modally' discernible from $B+T$. (See Essentialism §4.)

Does identity require indiscernibility in all modal properties? This seems too strong. For example, it is necessary to the first Roman Emperor that he have subjects, but not necessary to Octavian that he have subjects, although Octavian was the first Roman Emperor. This example is inconclusive, since 'the first Roman Emperor' is a definite description and the necessity is *de dicto*: it is not necessary *de re* to the Emperor, that man, that he have subjects (see De re/de dicto §1; Descriptions §2). This may seem to rebound on the cat example: '$B+T$' is also a definite description, 'the sum of *B* and *T*', so the fact that *C* might not have coincided with $B+T$ does not entail that they are distinct, since by the theory of descriptions '$C = \text{the } A$' just means

$$\forall x(x \text{ is an } A \equiv (x = C)).$$

But the cases differ, for while it is true of Octavian that he was an emperor, it is not obviously true of the cat that it is a sum of body and tail. The difference is again modal: no emperor is essentially an emperor, but sums are essentially sums, and *C* is not essentially a sum (see Essentialism §4).

This gives us a more precise modal version: if *a* and *b* are indiscernible with respect to all their non-modal properties and all their 'essential' properties then *a* = *b*. What then is an essential property? One which *a* must have if it exists. But being identical with *a* is such a property, so triviality is again a problem. Furthermore, deciding whether a property is essential or not may turn on deciding identity questions. While this indicates that matters of essence are closely connected with identity, we have to restrict attention to material properties again, and modality muddies considerations.

3 Relations and thought experiments

Once we admit relational properties, that is, consider how individuals stand in relation to others, we radically enlarge the range we quantify over and enhance what can be discerned. Though two electrons might be qualitatively indiscernible, if one is 1 metre away from a third particle while the other is not, they are distinguished by this relational property. The Thomistic view that matter individuates bodies which are alike in nature is also relational: $a \neq b$ because *m* is *a*'s matter and not *b*'s.

This suggests a more promising non-modal version: individuals which are 'materially' indiscernible, that is,

indiscernible with respect to all material properties (monadic and relational), are identical. Can there be two distinct materially indiscernible individuals? Take the two electrons mentioned above. If the third particle is a proton and the electron that is not 1 m from it is 1 m from no other proton, then the electrons differ in their material relations. If both were 1 m from qualitatively indiscernible protons the electrons would not thereby differ materially, for though this electron is 1 m from this proton and that electron 1 m from that proton, we can no longer use this information to discern them, since it turns on this proton's being distinct from that one.

To find numerically distinct but materially indiscernible individuals, philosophers have concocted thought experiments with symmetrical universes. Max Black (1952) envisaged a universe consisting solely of two qualitatively indistinguishable spheres with indiscernible histories. Each sphere and each part of a sphere is materially indiscernible from a numerically distinct sphere or part of a sphere. Except for symmetrical individuals, every part of the universe has a numerically distinct *doppelgänger*. Black's universe appears possible, so either the spheres would have to be merely formally distinct, violating the principle, or there would have to be some haecceitas or individualizer to distinguish the spheres, each being uniquely related to its own haecceitas. But to posit such unobservable things seems unacceptably metaphysical.

Those who uphold the principle of material indiscernibility argue by *modus tollens* that there can be no symmetrical universe, for the spheres would be one sphere, and since the sphere is spherically symmetrical it would 'collapse' to a line, whose points, being identical, would collapse to a point: the only symmetrical universe would be monistic. Since our universe is apparently not symmetrical, it is hard to know how to resolve this dispute.

4 Empirical counterexamples

Harder and more disturbing evidence against Leibniz's principle in almost all versions comes from physics. Two electrons in an atomic shell are discernible from one another while both are in it, having opposite spins, but if an electron enters the shell and an electron later leaves it, there is no way to answer the question whether the same electron left as previously arrived. It is not merely that we cannot observe the proceedings closely enough: there is seemingly no fact of the matter. But electrons are fermions and so must always be discernible at a point in time by their quantum states. The Leibnizian may therefore retreat to holding that identity for electrons is only synchronic, and that they are only momentary, though lone electrons seem to persist happily, only gregarious ones 'losing their identity'. The case is worse for photons, which are bosons and so can be temporarily indiscernible in all their material properties, as well as their position and relations. They can become superposed 'soup': a laser is just very homogeneous photon soup. Yet the intensity of a laser beam depends on how many photons are in it: coincident photons do not collapse into one. A Leibnizian can rescue indiscernibility here only by denying that photons are individuals: talk of photons must then be a physicist's dispensable *façon de parler*.

So although there is dispute about what the indiscernibility of identicals amounts to, and whether in this or that version it is true, we appear comfortable conceiving of things as individuals only to the extent that they are in some sense discernible.

Ideology

An ideology is a set of ideas, beliefs and attitudes, consciously or unconsciously held, which reflects or shapes understandings or misconceptions of the social and political world. It serves to recommend, justify or endorse collective action aimed at preserving or changing political practices and institutions. The concept of ideology is split almost irreconcilably between two major senses. The first is pejorative, denoting particular, historically distorted (political) thought which reinforces certain relationships of domination and in respect of which ideology functions as a critical unmasking concept. The second is a non-pejorative assertion about the different families of cultural symbols and ideas human beings employ in perceiving, comprehending and evaluating social and political realities in general, often within a systemic framework. Those families perform significant mapping and integrating functions.

A major division exists within this latter category. Some analysts claim that the study of ideology can be non-evaluative in establishing scientific facts about the way political beliefs reflect the social world and propel people to specific action within it. Others hold that ideology injects specific politically value-laden meanings into conceptualizations of the social world which are inevitably indeterminate, and is consequently a means of constructing rather than reflecting that world. This also applies to interpretations undertaken by the analysts of ideology themselves.

1 Marxist approaches

The study of ideologies initially arose from the attempt of the French writer Antoine Destutt de Tracy to create a systematic science of ideas, distinct from prejudices. That meaning of ‘ideology’ is no longer of importance in contemporary debate. Of far greater consequence was the Marxist conception of ideology, which has had a significant impact on the inquiry into, and understanding of, ideology, as well as directing its analysis into an intellectual cul-de-sac. In the nineteenth century Karl Marx (§§6, 7), assisted by Friedrich Engels, converted ’ideology’ into a critical concept (Marx and Engels 1846). The great value of Marx’s contribution lay in relating ideology decisively to the socio-economic practices from which it sprang - specifically to capitalist production - and in pointing out how effective its thought edifices could be in (mis)directing human energies and shaping human institutions. Ontologically, ideology could be contained in Marx’s foundational materialist axiom that being conditions consciousness. Epistemologically, it emerged as a special case when human consciousness reflected the alienated, dehumanized and partial existence of human beings, through a distorted representation of that existence (see Alienation §§3, 5). Hence not all thought was ideological. Ideology arose historically as an inverted reflection of the material contradictions of the capitalist mode of production and denoted only one type of socially produced thought, albeit a very pervasive one. The misrepresentation of the real character of social relations, ’the distorted language of the actual world’, was thus both a historical necessity - because of the conditioned nature of human thought - and a function of ideology (now interpreted as concealment). In identifying this latter aspect, Marx emphasized ideology as a reflection, and in itself a form, of the power and exploitation embedded in the social contradictions to which material conditions give rise. The dominant class - the bourgeoisie - was the beneficiary of ideology, precisely because ideology served its interest - namely, the maintenance of its domination - through inverting the real facts about capitalism. Originally Marx employed the analogy of the mirror image of the *camera obscura* to illustrate that distortion and to distinguish ideology from error or illusion. However, his analysis was more sophisticated in that he did not see ideology as a direct reflection of a distorted reality but as an inversion of that distortion, so that the repressive elements of capitalism, such as entrapping people in commodity exchange relationships, could be presented as free trade.

One consequence of Marx’s analysis of ideology lies in its opposition to true consciousness. The function of ideology is concealment, but its critical identification as such is a crucial step towards its overcoming. Ideology is hence an ephemeral phenomenon, and once the practices which give rise to it are negated, it too will disappear. A second consequence is its association with power and domination; indeed, for many analysts the ‘dominant ideology’ thesis locates its central feature in the superimposition of a class or particular world view on a society. Thus for the Italian Marxist Antonio Gramsci (§3), ideologies were superstructures, consolidated by intellectuals (Gramsci 1971). This replaced the need for a forced class rule through providing an integrating culture in the broadest sense. Such ideologies included art, religion, literature and law, avoiding reduction to economic analysis.

They ensured the hegemony of a dominant class over the masses by means of a consensual historical bloc. The important notions of practice and action - the organizational attributes of ideology - are incorporated in this view which, at the same time, loses its ephemeral link to specific historical circumstances.

Louis Althusser further encouraged Marxists to analyse ideology on its own merits (Althusser 1984). He retained its dissimulative function but emphasized its integrative one, 'interpellating' individuals and bestowing on them a subjective (ostensibly free), as well as subjected, identity within their society. Thus recognition and misrecognition operate side by side to sustain a given society. All classes produce ideology, which is now seen as a permanent material phenomenon in societies, existing objectively in the form and substance of social practices and their rituals. In that sense, ideology is neither a distortion nor an illusion. It is an 'imaginary' representation of the real, yet also a 'lived' relation between individuals and their conditions of existence, a 'new reality'. Elaborating on earlier Marxist analyses, the state in particular was seen to employ 'ideological state apparatuses' in order to ensure the dominance of the established order and its relations of production.

2 Generalizing ideology and the problem of knowledge

The limitations of the Marxist family of theories in respect of ideology lay in restricting it to a highly specific mode of thinking about politics and society. The concept of ideology thus became attached to a number of perspectives: to a reflection in thought of historically situated classes; to an inverted or misperceived form of consciousness, detached from social and material reality; and to the pejorative converse of social truth, which would either replace ideology or existed, as scientific knowledge, in parallel to it. Although none of these perspectives was unequivocally held by any one thinker in the Marxist tradition, all were used to some effect within more 'vulgar' *marxisant* discourses about ideology. Outside the Marxist tradition, although in partial reaction to it, these themes were picked up or discarded in different measures. Althusser importantly recognized the relative detachment of ideology from a material base, a move which has both been welcomed and deplored. His views thus coalesced with those who were analysing ideology as a phenomenon worthy of study in its own rights rather than merely as an epiphenomenon.

Karl Mannheim had already been taking a similar direction, although for him it grew out of dissatisfaction with some of the problems incumbent in Marxism. In his seminal *Ideology and Utopia* (1929) he retained the Marxist insight into the social and historical origins of thought, linking the meaning of an idea not to the laws of logic but to its genesis. However, rather than subscribing to the view that ideology was a reflection of a particular historical distortion, Mannheim suggested that it was a pluralistic product of diverse social groups undergoing common experiences. Knowledge was a cooperative process, but political discussion was further characterized by an unmasking of rationalized situational motivations which were attributes of a collective unconscious. These could adopt two forms: ideology and utopia. Ideology referred to the interest-bound thought of ruling groups and had conservative, stabilizing consequences. It was divided into two conceptions: a particular conception, primarily on the psychological level, in which ideology is consciously recognized as a lie or an error; and a total conception, on a socio-historical level, in which the entire *Weltanschauung* of a group is involved. Utopia referred to an emphasis on the transformation of a society and, unwittingly, on misdiagnosing it by identifying only its negative features (see Utopianism §1). Mannheim's distinction is itself debatable, as both ideology and utopia could be complementary forms of an unconscious, action-oriented interpretation of a historical reality.

Mannheim raised the problem of analysing ideology as a fundamental methodological issue of the social sciences. Having abandoned the Marxist ontology of a true consciousness which would emerge once social contradictions were negated, and having unmasked Marxism itself as ideological in the total sense, Mannheim's general theory of ideology paved the way for a new epistemology expressing the notion that 'all historical knowledge is relational knowledge, and can only be formulated with reference to the position of the observer' (1929: 71). The problem became how to overcome the relativism implicit in the recognition that all social points of view were ideological, while eschewing any adherence to ultimate values (see Relativism). That was made especially difficult because an older epistemology was still attached to relativism, an epistemology which assessed each assertion from the intrinsic perspective of the logical and universal truths it contained. By replacing relativism with relationism - an appreciation, influenced by the holism of psychological Gestalt theory, of the systemically reciprocal interconnections among all historically and spatially located thinking - an evaluative procedure could emerge which surmounted the limitations of ideology. Intellectuals, those who were able to cut loose from their historical

and social situatedness, could incorporate conflicting viewpoints in a flexible and dynamic relationism, assessing their scope and validity. An initially non-evaluative relativism, incapable of discriminating among various static and eternal views, would make way for an inescapably evaluative sociology of knowledge. The latter would embrace a more modest conception of truth, critically held and approximate, based on the multiple perspectives in a given society and seeking comprehensiveness and fruitfulness of understanding (see Sociology of knowledge).

3 Ideology, political science and culture

Ultimately, Mannheim too sought to transcend ideology, accepting its inevitability but arguing, somewhat unsatisfactorily, for a new objectivity alongside it. Mid-twentieth-century political scientists, while heavily influenced by Mannheim’s concentration on ideology as an ubiquitous social and political given, had no such epistemological and critical aspirations, and approached their subject-matter both as a conscious, empirically ascertainable product of politico-social groups, and as capable of rational assessment by external analysts. Furthermore, the location of ideology as the product of groups in specific historical situations was played down through employing a neo-positivist, individualist methodology. In particular, US political science adopted a functional approach, concentrating on the concrete phenomenon of ideologies rather than the category of ideology, and regarding them as necessary, often socially beneficial, and distinguishable from other types of thinking about society or in society (see Functionalism in social science §2). Political scientists, however, exhibited two different interpretations of ideologies. One, as exemplified in the work of Daniel Bell (1960) and Giovanni Sartori (1969), restricted them to doctrinaire, highly consistent and closed systems of ideas cum ’social levers’, usually infused with extremist passion. These rationalist, deductive constructs, frequently having rhetorical purposes, were contrasted with pragmatic and empirical political belief systems. Given that distinction, it was possible to foresee the ’end of ideology’ as passion and imperviousness to temporal and spatial influences apparently gave way, at least in the West, to pluralism and an exhaustion with the great ’isms’. This approach underplayed both the ideological components of so-called ’pragmatism’ and the emotive elements endemic to political argument.

The second and more prevalent interpretation conceived of ideologies as a general and omnipresent category encompassing all relatively coherent sets of cultural symbols - ideas, beliefs and attitudes - that are action-oriented, and whose function it is to interpret the political system and to direct and justify public policy aimed towards preserving or changing political institutions and processes. That approach emphasizes ideologies as consciously-held views of aggregates of individuals or of ruling groups who impose them on such aggregates. Individual conduct is thus organized and integrated by cognitive rational constructs - regarded as simplified selection rather than distortion - abetted by evaluation of the options for action in the social world. This return to the scientific study of ideology as a value-free activity differs from the Marxist juxtaposition of ideology and science, because the truth-distortion dimension is removed from the consideration of ideology, and science is employed to comprehend, not to replace, ideology. Such a concrete and empirical view of ideologies involves typologies frequently based on a left-right continuum, ranging from communism through socialism, social democracy, liberalism, conservatism and fascism. Newer belief systems such as feminism, nationalism or ecologism fit uneasily into that rubric, nor can they always claim the comprehensiveness expected of systemic political ideologies. Others, such as anarchism or libertarianism, cut across conventional boundaries. Psychological offshoots of this approach relate to the formation of attitudes and their classification.

The structural anthropology of Claude Lévi-Strauss (§6) and cultural anthropology of Clifford Geertz (1964) demonstrate affinity, although not identity, with such systemic, self-substantiating conceptions of ideology, as does Althusser’s analysis. For Lévi-Strauss myths, and ideology as modern myth, manifest an internal, self-contained logic and are endowed with unconsciously held meaning. Unlike Althusser, he regarded ideology as a ’thought-of’ order external to objective reality, but like Althusser, he argued that they made sense only in their relationships with ’lived-in’ orders. For Geertz, an ideology is an ordered system of cultural symbols, both cognitive and expressive, that is interpenetrated by social and psychological processes and in turn organizes them into patterns of meaning. Its systemic features are ’maps of problematic social reality’ which enable purposive action and perform an integrative function, irrespective of whether those maps are accurate or not. The relationship of an ideology to the real world is no longer as centrally challenging, methodologically speaking, as it is for Marxist theories. It is primarily assessed as a cultural whole performing necessary functions.

4 Words, concepts and interpretation

In the USA political science developed its conceptions of ideology in almost complete isolation, not only from a consideration of the unconscious elements of ideology which separate political actors and their thoughts from the perception of the analyst, but also from hermeneutic arguments which were beginning to affect the concept of ideology through a denial of the very epistemological validity of such separation. Hermeneutics transformed the view of ideology by refusing to ask questions concerning how to gain access to reality, or how to avoid the illusions of human perception (see Hermeneutics). Instead, social and historical actions and utterances are seen as bereft of objective meaning, and are to be experienced through the interpretive medium of the observer. The polysemy of words necessitates an appreciation of the dual contexts of both their authors and their readers or consumers in attaching a determinate meaning to texts. In allowing for a socio-cultural decontextualization of texts 'as wordless and authorless' objects, and for the 'surplus of meaning' that words carry, theorists such as Paul Ricoeur recognize the function of ideology as effecting an inevitable closure of interpretation without which consciousness, self-representation and meaning, as well as social integration, are unattainable. Although it is possible to achieve critical distance from ideological closure, it will always - echoing Mannheim - be incomplete. The treatment of ideology is now virtually detached from the circumstances of its production, but is enriched by a sophisticated appreciation of the coexistence of intentional and unconscious import. Here, ideological unconsciousness is not necessarily distorted consciousness, the permanence of ideologies represents the infinite variety of the human imagination, yet the tentativeness of understanding is underlined by a consciousness of its own value-laden temporality.

The relationship of hermeneutics to the examination of language is crucial. The analysis of ideology was advanced by a harnessing of the insights of Ludwig Wittgenstein (§11) and Ferdinand de Saussure. Wittgenstein's notion of language games assisted in crystallizing the view that words could shape, rather than reflect, reality, albeit within a network ineluctably reflecting grammatical rules. Saussure's semiology - the study of signs - likewise suggested that the relationship between signs and meaning was arbitrary, but that meaning could be imposed on words by organizing them in specific patterns. In this systemic perspective, the mutual proximity of words established their meanings. The critical function of ideology was diminished by regarding it as a socially produced text in which meaning was related to usage and to form, impacting on, not merely representing, practices in the 'real' social and historical world. However, ideology was itself re-established as a symbolic human practice of direct interest to scholarship. Discourse analysis concentrates on these findings, but also links the study of language as a social phenomenon with the Marxist theme of ideology as domination. Successful closures of meaning in language reflect the power relationships of its users, and language is hence a medium through which political legitimacy may be accorded to groups, overtly or frequently through unconscious dissimulation. This method can be applied not only to the broad ideological families that attempt to control public policy making but to a wide range of discourse situations in which meanings are exchanged and displaced in specific, everyday, conversational contexts (see Discourse semantics).

From the perspective of political theory it is possible to combine the focus of political scientists on the overt and systemic contents of ideological debate, with an interest in language and meaning and in the decoding of unconscious ideological messages. W.B. Gallie's notion of the essentially contested nature of political concepts presented them as indeterminate because of the impossibility of agreeing on their normative components (Gallie 1955-6). However, they are also indeterminate due to their inability to contain all their logically entailed meanings simultaneously. Hence, ideologies may be seen as clustered patterns of a wide spectrum of political concepts, such as liberty, justice or power, each of which is necessarily decontested, reflecting a specific set of historical and spatially located social meanings without which political decision making cannot be effected. A potentially unrestricted universe of meanings is also limited by logical and morphological constraints operating in all ideological systems, as political concepts are decontested by their users through deliberately or unconsciously arranging their proximity to other political concepts. Different conceptual patterns may be produced by any social group, although these still may be usefully classed according to loose family resemblances that approximate major ideological traditions such as liberalism, conservatism or socialism. Decontesting also expresses the inevitability of political power which, importantly, need not be exploitative. Ideologies hence complete over their claims to confer legitimate meanings on political concepts and words, and map and recommend thought practices which in turn affect political action. Ideology nevertheless is not coterminous with political thought, but is one of its analytical dimensions: a particular interpretive handling of political concepts which are suspended between logical indeterminacy and cultural determinacy.

Ikhwan al-Safa’

The philosophy of the group of Arab philosophers of the fourth or fifth century AH *(tenth or eleventh century* AD*) known as the Ikhwan al-Safa’ (Brethren of Purity) is a curious but fascinating mixture of the* Qur’anic*, the Aristotelian and the Neoplatonic. The group wrote fifty-two epistles, which are encyclopedic in range, covering matters as diverse as arithmetic, theology, magic and embryology. Their numerology owes a debt to Pythagoras, their metaphysics are Aristotelian and Neoplatonic and they incorporate also a few Platonic notions into their philosophy. The latter, however, is more than a mere synthesis of elements from Greek philosophy, for it is underpinned by a considerable* Qur’anic *substratum. There are profound links between the epistemology and the soteriology (doctrine of salvation) of the Ikhwan, and it would not be an exaggeration to say that the former feeds the latter. In the history of Islamic philosophy the Ikhwan illustrate a group where the Aristotelian and the Neoplatonic clash head-on and where no attempt is made to reconcile competing and contradictory notions of God, whom the Epistles treat in both* Qur’anic *and Neoplatonic fashion. The final goal of the Ikhwan is salvation; their Brotherhood is the ship of that salvation, and they foster a spirit of asceticism and good living accompanied by ‘actual knowledge’ as aids to that longed-for salvation.*

1 Life and works

The Arabic name Ikhwan al-Safa’ has been translated as both ‘Brethren of Purity’ and ‘Brethren of Sincerity’. Both are possible, though the former is probably to be preferred because of the emphasis throughout the group’s writings on the concept of purity achieved via a life of asceticism and virtuous living.

Little firm information is available about their exact identities, their lives and the precise time during which they flourished. Most scholars agree, however, that they lived in Basra in the fourth or fifth century AH (tenth or eleventh century AD); beyond that there has been much diverse speculation. Their own thought and philosophy is enshrined in fifty-two epistles (*rasa’il*) of varying lengths which are encyclopedic in their scope and cover a vast number of topics. Formally, these epistles divide into four major sections: the first fourteen deal with the mathematical sciences, the next seventeen are on the natural sciences, a further ten deal with the psychological and rational sciences and the final eleven come under the heading of theological sciences. It should be noted that the Ikhwan’s usage of these divisions is much broader in range than might be expected at first sight. For example, the last of the epistles grouped under the heading ‘theological sciences’ deals with magic and related subjects. What may broadly be said to link all the epistles, however, is a mixed Aristotelian and Neoplatonic substratum, though it must be stressed here that the epistles of the Ikhwan al-Safa’ are more than just a synthesis of Aristotelian and dominant Neoplatonic themes. The incorporation by the Ikhwan of syncretic philosophical and theological themes, motifs, elements and doctrines in their writings was done with a particular soteriological purpose (see §4). Their eclectic borrowing was done with a view to bolstering the doctrine of purity which their name so neatly reflects.

2 Metaphysics

The metaphysics of the Ikhwan al-Safa’ are built upon those of Aristotle and Plotinus, though it must be emphasized that it is a Middle Eastern version of Aristotelianism and Neoplatonism which we encounter when we read the *rasa’il* of the Ikhwan. In the first place, their terminology is infused with such terms as matter and form, substance and accidents, the four causes and potentiality and actuality. Their usage of such terms, however, does not always adhere to the classical Aristotelian paradigm or usage. The development of terminology is often in a Neoplatonic direction. For example, the Ikhwan held in one place that substance was something which was self-existent and capable of receiving attributes. We recognize here a description akin to Aristotle’s usage of the word ‘substance’ in the *Metaphysics*. But elsewhere, confusingly, form is divided into two kinds, constituting and completing; constituting forms are called substances and completing forms are called accidents. Similarly, the Ikhwan adopted a fourfold terminology of causes - material, formal, efficient and final - but the shades of astrology and Neoplatonism hang heavily over at least two of the examples of these four causes which they provide. They say that the material cause of plants is the four elements of fire, air, water and earth, and that their final cause is to provide food for animals: both of these ideas are recognizably Aristotelian in their orientation, but the Ikhwan then go on to suggest that the efficient cause of plants is the power of the Universal Soul and that their formal cause has complicated astral elements!

It is, however, the Neoplatonic elements which dominate the articulation of all thought in the writings of the Ikhwan al-Safa’ and their metaphysics are no exception. The latter are imbued in particular with the Neoplatonic concepts of emanation and hierarchy. By contrast with the simple triad of Plotinus, which comprised the three hypostases of The One or The Good, Intellect and Soul, with the lower eternally emanating from the higher entity, the Ikhwan elaborated this into an emanationist hierarchy of nine ‘members’, hypostases or levels of being, as follows: the Creator, the Intellect, the Soul, Prime Matter, Nature, the Absolute Body, the Sphere, the Four Elements and the Beings of this world in the three divisions of mineral, plant and animal. In such a hierarchical profusion we can perhaps see the ghosts of Iamblichus and Proclus, who also multiplied the hypostases about which they wrote. It is noteworthy that for the Ikhwan, and in contrast to the view of Plotinus, matter becomes a full part of the emanationist hierarchy and is regarded in a positive light. Furthermore, and this time in a very Neoplatonic way, God in the Ikhwan’s scheme entrusts the movement of the world and the spheres to the Universal Soul, and it is the latter which channels God’s gifts finally into Matter itself (see Neoplatonism).

The Neoplatonic dimensions of the thought of the Ikhwan have profound implications for their view of God. The picture which they present of the deity in their epistles is a confused and ultimately contradictory one. No attempt is made to reconcile what is in fact irreconcilable. On the one hand, the Ikhwan present a God at the top of a complex emanationist hierarchy who is unknowable in the classic Neoplatonic sense. On the other hand, the Ikhwan present a Qur’anic God who is a guide and a help, and who is invoked at the end of many of the epistles as one who will grant success in correct action and show his people the path of righteousness. The majority of epistles also invoke God with the traditional Islamic *basmala*, ‘In the name of God, the Merciful, the Compassionate’. However, God’s power, as noted above, seems to be ‘shared’ in some way when it is exercised via the Universal Soul. To what extent, one may reasonably ask, does that compromise the traditional Islamic view of God? Furthermore, to what extent do the recognizably Islamic features in the Ikhwan’s portrait of God prevent that deity being considered as a total mirror of Plotinus’ One?

The metaphysics of the Ikhwan al-Safa’ must therefore be regarded as *sui generis*. Their mixing of Aristotelian and Neoplatonic elements had profound implications both for their theology and the coherence of their philosophy. Contradictions abound; if reasons be sought for this, it is worth remembering one theory, promulgated by A.L. Tibawi (1955), that the epistles are akin to the minutes taken during the deliberations of a learned society, meeting on many occasions over a period of years. This would account for both contradiction and repetition. We know from the epistles themselves that the authors urged their brothers to meet specially at set times, in closed sessions.

3 Epistemology

Thus far in this article, nothing has been said about the impact of Platonic thought on the epistles of the Ikhwan. This is because the Brethren revere the Platonic *hero* rather more than they revere purely Platonic *philosophy*. Socrates is admired as a great and wise philosopher who knew how to meet death bravely. However, some Platonic imagery does permeate the epistles (see Platonism in Islamic philosophy). The most notable image is that of the body constituting a prison for the soul. The Ikhwan indeed compare the soul in the body to the state of a man imprisoned inside a lavatory: the body’s blemishes and sins are like the filth in the lavatory. It is clear that the Ikhwan were familiar with Plato’s doctrine of Forms or *ideai*, since they quote a speaker saying that the different types of animal in the world simply mirror those in the world of the spheres and the heavens (see Plato). However, this is not a doctrine for which the Ikhwan seem to have had much use, for they neither discuss nor elaborate upon it.

It is, therefore, unsurprising that the Ikhwan’s epistemology differs quite radically from that of Plato. The latter looked forward to a state of real knowledge achieved when the soul was separated from the body; but in the soteriology and epistemology of the Ikhwan, one could gain some knowledge of the divine in this world to help one reach Paradise. Indeed, they present their epistles to the world as a body of just such knowledge. For them, learning was much more than mere recollection or reminiscence. They held that the soul was ‘potentially knowledgeable’ and, with instruction, could become ‘actually knowledgeable’. That instruction should be via the senses, the intellect and logical deduction, and they stressed that we could know nothing without the senses. This is indeed a far cry from Plato’s well-known suspicion of evidence or knowledge gleaned via the senses, and his overwhelming exaltation of the intellect.

4 Soteriology

The mass of information - philosophical, theological and other - adumbrated in such an encyclopedic manner in the epistles of the Ikhwan al Safa’ is probably incomprehensible as a totality unless one bears in mind the driving force which lies at the heart of the epistles themselves. The Ikhwan did not compile the epistles from a pure love of knowledge and for no other reason. The magpie eclecticism with which they surveyed and utilized elements from the philosophies of Pythagoras, Plato, Aristotle and Plotinus, and religions such as Christianity, Judaism and Hinduism, was not an early attempt at ecumenism or interfaith dialogue. Their accumulation of knowledge was ordered towards the sublime goal of salvation. To use their own image, they perceived their Brotherhood, to which they invited others, as a ‘Ship of Salvation’ that would float free from the sea of matter; the Ikhwan, with their doctrines of mutual cooperation, asceticism and righteous living, would reach the gates of Paradise in its care.

What, then, did it mean for the Ikhwan al-Safa’ to ‘do philosophy’? It did not mean to throw off the religious constraints of the Qur’an and to become pure rationalists. Though they often use the Qur’an as a cloak to disguise their Neoplatonism, one cannot ignore the massive Qur’anic substratum elsewhere in their writings, which has no such intent. ‘Doing philosophy’ did not mean either the uncritical acceptance of the data from a variety of sources such as Pythagoras, Plato and Aristotle, not to mention Plotinus, even though they were profoundly influenced by at least three of these four ancient masters and it is no misnomer to describe the Ikhwan as ‘Muslim Neoplatonists’. Philosophy, for the Ikhwan, was still the handmaiden of a precise theological goal: salvation for the soul. Their eclecticism and tolerance provided them with a unique methodology for the achievement of that goal. Thus they searched out the texts of other creeds and the philosophies of non-Muslim sages in search of materials which might bolster their own ethics of purity and asceticism. Their intellectual heroes were Socrates and Jesus as well as Muhammad. Above all, knowledge and philosophy were always soteriological tools and never ends in themselves.

Il’enkov, Eval’d Vasil’evich (1924-79)

Eval’d Il’enkov advanced a distinctive brand of Hegelian Marxism that was influential in the rejuvenation of Soviet philosophy after Stalin. Il’enkov draws on Hegel and Marx to argue that non-material phenomena can exist as genuine features of objective reality independent of the consciousness and will of individuals. Il’enkov argues that the existence of such phenomena, conceived as objectifications of human social activity, is central to the explanation of the nature and possibility of the human mind. The world becomes a possible object of thought through its ’idealization’ by activity, and children attain mental capacities in the full sense only through the appropriation of the ideal as it exists objectified in ’humanity’s spiritual culture’.

Il’enkov’s defence of the reality of culture represents a critique of positivism and scientism, a critique he pursued in many other writings. A tireless opponent of reductionist theories of mind and ’biological determinist’ theories of human development, he advanced a view of persons as socially constituted beings and stressed socialism’s obligation to create the circumstances in which human beings may develop their almost limitless potential. Like many in the post-Stalin era, his criticism of the Soviet philosophical establishment takes the form of a call for a genuinely orthodox form of Marxism, faithful to the spirit of Marx’s thought.

1 Life

Perhaps the most inventive of Russian Marxist philosophers, Eval’d Il’enkov made a significant contribution to the renewal of Soviet philosophy after the Stalin period. He advanced a form of Hegelian Marxism that stressed the active powers of human beings to transform themselves and their world through the objectification of culture. He was a relentless critic of reductionism and scientism, which he believed fed the dehumanizing elements of Soviet ideology, and his works upheld the importance of critical philosophical reflection in opposition to dogma.

Il’enkov was born in Smolensk, though he lived most of his life in Moscow. He was educated at the Moscow Institute of Philosophical and Literary Studies (IFLI) and Moscow State University (MGU), where he defended his ’candidate’s dissertation’ in 1954. During the ’thaw’ in the early 1960s, he published the works which established him as a leading voice in the Soviet philosophical community. They include a treatise on Marx’s method, *Dialektika abstraktnogo i konkretnogo v ‘Kapitale’ Marksa (The Dialectics of the Abstract and the Concrete in Marx’s ’Capital’)* (1960), and an influential essay, ‘Ideal’noe’ (’The Ideal’) (1962), in which Il’enkov argues that non-material phenomena are genuine constituents of objective reality and advances a distinctive account of the relation of mind and world. Il’enkov continued to explore these themes in many subsequent writings spanning a variety of fields, including history of philosophy, education and aesthetics. Like many of his contemporaries, Il’enkov experienced political difficulties. Accused of the heresy of ’epistemologism’, he lost his position at MGU in 1955. The rest of his career was spent at Moscow’s Institute of Philosophy, though he continued to have an uneasy relation with the Soviet philosophical establishment, which was suspicious of the critical and humanistic elements of his work. He died in 1979, by his own hand.

2 Dialectics

Il’enkov’s early work on dialectics develops the so-called ’method of ascent from the abstract to the concrete’ sketched by Marx in his ‘Introduction to a Critique of Political Economy’. Il’enkov argues that in both natural- and social-scientific inquiry, the objects of cognition are ’organic’ wholes, consisting of parts standing in relations of mutual determination. These wholes develop through the tensions, or dialectical contradictions, between their parts. Il’enkov argues that cognition proceeds by isolating the ’principle of development’ of the whole. This phenomenon - the ’cell’ or ’unit’ - represents the part, the evolution of which necessitates the development and mutual determination of the other parts. The ’unit’ is thus a ’concrete universal’ that explains the whole’s development through the necessary interrelations of its developing parts. Cognition therefore represents a movement from the *abstract* (from the abstraction of the unit) to the *concrete* (to a conception of the whole as a ’unity in diversity’ of essentially related components). In this process, historical and logical analyses coincide, for to represent the history of the object is to chart the necessary logic of its evolution. Il’enkov argues that Marx’s analysis of capitalism in *Capital* illustrates this method. By isolating the concept of commodity and tracing its development, Marx reconstructs the logic of capitalism, the principles of its existence and necessary transformation.

Such esoteric epistemology may seem an unlikely focus for scholars seeking to reanimate Marxism in Eastern Europe. But for Il’enkov (and others such as A.A. Zinov’ev and the Czech philosopher Jindřich Zelený), the analysis of ’Marx’s logic’ was an important catalyst because it demanded that Marx be treated, not as an authoritative source of state ideology, but as a philosopher whose ideas could be understood only through a critical engagement with the history of Western traditions in philosophy. Approaching Marx this way showed the virtues of scholarship, rather than partisanship. In addition, Il’enkov’s work on dialectics had a political subtext. Il’enkov contrasts Marx’s approach with empiricism. The latter typically construes the knowing subject as arriving at a conception of the world by a movement from concrete to abstract: the subject makes sense of perceptual data through the formation and application of abstract concepts and general laws that facilitate the organization and prediction of experience. Il’enkov was convinced that empiricist conceptions, often ill-conceived and poorly articulated, were prevalent in Soviet philosophy and contributed to positivistic infatuations with science as an all-powerful force. Il’enkov’s work on method thus represents a critique of empiricism in Soviet thought and scientism in Soviet culture.

3 The problem of the ideal

Il’enkov’s most original contribution to philosophy is his treatment of ‘the problem of the ideal’. What place should a materialist find for meaning, value and universals in the material world? Many of Il’enkov’s Soviet contemporaries portrayed such phenomena as mental in kind and argued that mental states were ultimately reducible to physical states of the brain: everything seemingly non-material is in the head. In contrast, Il’enkov maintains that ideal phenomena can have a supra-individual existence as aspects of the world as it is independent of individual consciousness. Drawing on Hegel and Marx, Il’enkov insists that there is nothing mystical in the objective existence of the ideal, for ideal phenomena are objectifications of human activity. In the course of the transformation of nature by human action, meaning and value are written into nature:

> ‘Ideality’ is like a peculiar stamp impressed on the substance of nature by social human life activity; it is the form of the functioning of a physical thing in the process of social human life activity. All things incorporated into the social process acquire a new ’form of existence’, an ideal form, quite distinct from their physical nature.
>
> (1979: 148)

Il’enkov argues that our natural environment is organized or ‘humanized’ by activity: our world is full of physical entities - artefacts, signs, symbols, models - made meaningful through action. The edifice of objectified ideality represents (in Marx’s words) humanity’s ’inorganic body’ or ’spiritual culture’, embodied in our environment as ’thought in its otherness’:

> Outside the individual and independently of his consciousness and will exists not only *nature*, but also the socio-historical environment, the world of things, created by human labour, and the system of human relations, formed in the process of labour. In other words, outside the individual lies not only nature as such (‘in itself’), but also *humanized* nature, nature re-made by human labour. From the point of view of the individual, ’nature’ and ’humanized nature’ merge together into the ’surrounding world’.
>
> (1964: 41-2)

This view is part of a dynamic vision of human beings creating themselves through the creation of culture. Transformed by activity, our environment confronts us as rich with significance; in virtue of this significance, we act further to transform our world, endowing it with new meaning and precipitating further transformations. Human beings must constantly adapt to their changing environment, acquiring skills necessary to orientate themselves within it. And in this dialectic, human beings gradually understand and harness the forces which define them and their world. Il’enkov sees communism as the project of attaining control over these powers.

Il’enkov’s account of ideality is intended to solve fundamental issues of the relation of mind and world. He argues that ‘nature "as such" is given to the individual only insofar as it is transformed into an object [*predmet*], into the material or means of production of material life’ (1964: 42). There is thus a sense in which all of nature is ’idealized’ by human activity: no object speaks to us unless it is brought within the compass of humanity’s spiritual culture. The primary object of thought is thus nature humanized or idealized.

In addition, Il’enkov’s position yields a distinctive view of thought itself, which is conceived as the capacity to inhabit an idealized environment: a thinking body is one which shapes its activity to the norms that constitute our humanized environment. Thought is thus construed as a species of movement, the ability to conform to and manipulate meanings as they are formed in the flux of social being. Il’enkov significantly does not represent this ability as innate in the individual: it is as socially constituted as the environment the thinking thing inhabits. Human children become thinking things in so far as they acquire the ability to orientate themselves in their environment by internalizing the forms of activity of their community (note here the continuity with Vygotskii’s psychology - see Vygotskii, L.S. §2). Thus, in contrast to the individualism of traditional epistemology, Il’enkov does not believe that each individual mind finds the world anew for itself. We enter a world which history has made cognizable and learn to find our way through the agency of others who help us appropriate our spiritual culture.

Il’enkov’s solution to the problem of the ideal may thus be seen to follow from the application of his dialectical method to the question of the relation of thinking and being. For Il’enkov, human activity plays the role of the ’unit’, the exploration of which reveals the nature and possibility of both halves of the cognitive relation - object (nature humanized by activity) and subject (the ’thinking body’ that inhabits the humanized environment). Each is born of activity and their unity is sustained in and through activity.

4 Popular and polemical writings

Il’enkov believed that philosophers should be moralists, and he produced a significant number of popular and polemical writings. Many address questions of education. Developing his view that human individuals are socially constituted beings, he argued that a socialist government has an overriding responsibility to create a culture which nurtures the abilities of all individuals. Il’enkov was critical of the trend towards specialization in the Soviet education system, arguing that it should be guided by Marx’s vision of the ’all-round individual’ whose capacities are universal in nature. Some of Il’enkov’s most striking writings on education were inspired by Aleksandr Meshcheriakov’s work on the education of blind-deaf children, which Il’enkov took to illuminate the social construction of cognitive processes, as well as the duties of a radical education system.

As fascination with the ’scientific-technological revolution’ grew in the USSR through the 1960s and 1970s, Il’enkov’s hostility to positivism became yet more pronounced. He was scathingly critical of thinkers who portray our mental lives as nothing more than a series of events in our brains, and he attacked the idea that the talents and aptitudes of human beings are genetically determined. The thirst to represent human beings as sophisticated machines, he suggested, was a symptom of the increasing technologization of social life. The latter was supposedly to be the theme of his final book, *Leninskaia dialektika i metafizika positivizma (Leninist Dialectics and the Metaphysics of Positivism)* (1980), which was to argue that although Soviet philosophers constantly reiterated Lenin’s critique of the Russian empiriocriticist, Aleksandr Bogdanov, the technocratic vision of social organization advanced by Bogdanov in fact pervaded Soviet culture. Unfortunately, this message was obscured when the book was cut for posthumous publication.

Il’enkov’s popular and polemical writings have aged badly, and though they have historical interest, they are not philosophically deep. Moreover, not all of these texts can be portrayed as progressive in orientation. His Hegelian attacks on formal logic, for example, provoked censure from thinkers anxious to animate Soviet philosophy by forging links with the analytic tradition. However, despite this, and the strident tone of much of his writing, with its call for a return to true orthodoxy after the perversions of Stalinism, there is no doubting the depth of Il’enkov’s philosophical vision, particularly in his early work, and his importance in preserving a cultural tradition of philosophical criticism in Soviet Russia.

Il’in, Ivan Aleksandrovich (1883-1954)

Educated in law and philosophy in the first years of the twentieth century at Moscow University and several Western European universities, Il’in produced an important two-volume commentary on Hegel’s philosophy (1918), and a number of substantial works in political and legal theory, ethics and religious thought, aesthetics and literary criticism in later years. As a resolute foe of the Bolsheviks before and after the Revolution of 1917, he was exiled by them in 1922, living in Berlin until 1938, and subsequently in Switzerland until his death. Throughout his exile he remained deeply devoted to his Russian homeland, circulating extensive proposals for the eventual reconstruction of the Russian state, Church and society following the collapse of the Soviet regime (see Nashi zadachi (Our Tasks) (1956a)). He developed his own distinctive theory of monarchy as an ideal political form, grounded in a doctrine of natural right, and advocated it as the most appropriate choice for Russia in the best case, though he withheld judgment as to whether it would prove historically possible to implement it in the conditions prevailing after the demise of the Soviet system. His writing also focused to a significant extent upon moral and spiritual discipline and renewal, for societies as well as individuals, as necessary conditions of the well-ordered state and the well-lived life.

1 Life

Il’in was born in Moscow; his father was a native Muscovite, and his mother was of German descent. He completed gymnasium in the spring of 1901, and entered the Faculty of Law of Moscow University in autumn of the same year, receiving his diploma in 1906. In the Faculty of Law he encountered two unusually inspiring philosopher-jurists, Pavel I. Novgorodtsev (from the beginning) and Prince Evgenii N. Trubetskoi (from the end of 1905), among his professors. They provided a solid grounding in the history of philosophy in addition to legal studies. Novgorodtsev conveyed a lively interest in natural right and the rule of law to his students, a lesson which Il’in absorbed thoroughly but interpreted in a distinctive way. Upon completion of his diploma Il’in was retained at the university (on the recommendation of both Novgorodtsev and Trubetskoi) to undertake the programme of studies leading to the master’s degree, was appointed *privat-dozent* in the Faculty of Law (1909) and eventually (1918) received both the master’s and the doctoral degrees at once for the two volumes of his dissertation on Hegel.

Il’in undertook an intense study of Hegel beginning in 1908 and continuing until 1916, by which time his dissertation was essentially completed. During this period he spent two years (1911-12) engaged in study and research in Germany, Italy and France, including periods of work at Heidelberg (with Jellinek), Freiburg (with Rickert), Göttingen (with Husserl and Nelson) and Berlin (with Simmel).

With the outbreak of the First World War, Il’in began to take an active role in advocating the defence of tsarist Russia from enemies within and without. Following the events of February and October 1917 he became a particularly vigorous and public opponent of the Bolsheviks who arrested him six times between 1918 and 1922, finally exiling him in September 1922, under threat of execution, along with many other scholars, philosophers, theologians and writers irreconcilably opposed to the new regime.

Settling in Berlin, he became a professor at the newly opened Russian Academic Institute and taught there until the Nazis removed him in 1934 for refusal to cooperate with their propaganda aims. Forbidden all employment in Nazi Germany, deprived of the right to speak publicly, and watched by the Gestapo, he finally succeeded in leaving Germany for Switzerland in July 1938, where he remained until his death. During the difficult years of exile he produced a substantial number of highly original works on ethics, political theory, aesthetics, religion, and moral and spiritual discipline (see Poltoratzky 1989; Lisitsa 1993).

2 Commentary on Hegel

Il’in’s commentary, *Filosofiia Gegelia kak uchenie o konkretnosti Boga i cheloveka (The Philosophy of Hegel as a Doctrine of the Concreteness of God and Man)* (1918) was published in two volumes and its structure reflects its intended purpose as a dissertation to be submitted to the Faculty of Law of Moscow University. Volume 2, *Uchenie o cheloveke (The Doctrine of Man)* was, broadly speaking, a study of Hegel’s theory of the state, while volume one, *Uchenie o Boge (The Doctrine of God)*, provided an overview of Hegel’s philosophical position.Il’in

declined to engage in the most usual form of Hegel commentary, the *explication de texte* retracing the author's exposition section by section through a single work. His commentary is rather a *reconstruction*, theme by theme, of the major distinctive elements of Hegel's position, often drawing simultaneously on several of Hegel's texts, while duplicating the rhetorical structure of none of them.

Volume 1 of *Logic*. It is of special interest in that Il'in explicated Hegel's doctrine of *speculative concreteness* with a degree of clarity and detail unmatched by any commentator before him. This volume of the commentary is itself structured in terms of the distinctive doctrine of speculative concreteness, and demonstrates that this doctrine, and the criterion of reality formulated in terms of it, also structure the central claims of Hegel's *Logic* as a whole.

The second volume of Il'in's commentary offers an extended reflection upon the central themes involved in Hegel's *Philosophy of Right*; thus 'freedom', 'will', 'right', 'morality' and 'the ethical' are all treated in separate chapters there, as well as 'humanity' and 'the state'. In this study, Il'in focused significant attention on Hegel's concept of God, most especially arguing that in Hegel's conception, the divine nature as a whole is subject to Becoming, thus capable of undergoing the tragic experience of suffering and death. Il'in himself held to the traditional doctrine of the divine nature as impassible, and so he personally rejected the view he ascribed to Hegel. He argued that in working out the details of his ethical and political doctrine Hegel was forced to 'compromise' the original intent of his philosophy which, according to Il'in, was above all to produce a theodicy (see Grier 1997).

Both volumes taken together constitute a profound, subtle and sustained reflection on the theological implications of Hegel's philosophy, and the influence of Il'in's commentary has been greatest in this area. Both Hans Küng's *Menschwerdung Gottes* (1970) (translated as *The Incarnation of God* (1987)) and Cyril O'Regan 's *The Heterodox Hegel* (1994) were significantly influenced by Il'in's commentary.

It should be pointed out, however, that it is only the drastically shortened German translation, *Die Philosophie Hegels als kontemplative Gotteslehre* (1946) produced by Il'in himself, that has been known to non Russian-speaking scholars. Owing to Il'in's failing health and his extreme reluctance to take time away from other unfinished projects, eight of the ten chapters of the original Russian volume 2 were left out of this edition.

3 Political theory

In formulating his own theory of right, authority, law and the state Il'in demonstrated the originality and independence of his thought to a striking extent. He departed from the settled paths and terms of modern European political theory to such a degree that all of his works on the subject must be read attentively in their entirety to avoid misunderstanding. He set aside the wisdom of the post-Lockean liberal democratic synthesis (which he labels generically 'the republican principle') as a conception aspiring merely to avoid the worst excesses of governmental tyranny, always threatened by degeneration into an unmanageable anarchy of extreme individualism (1979, chaps 6, 7). In its place he offered a theory of maximum aspiration, a conception in which the ultimate justification of state authority would be the development in the citizenry of a moral, legal and spiritual culture in which the requirements of natural right would be so widely exemplified in human conduct as to make genuine self-government a reality. He conceives of 'monarchy' (in his own distinctive meaning of the term) as the most appropriate form for the realization of such a state (1979, chaps 1-3).

'*Pravosoznanie*', from *pravo* (right or law) and *soznanie* (consciousness), is Il'in's distinctive term for an awareness (and acceptance) by the individual of the system of obligations and rights specified in natural (and positive) law. Conduct guided by *pravosoznanie* is necessary for any human community that provides the conditions for the emergence of spiritual life, the highest good for the individual, and *pravosoznanie* is itself one of the constituent elements of that highest good. A rational system of positive law would reflect the structure of natural law (1956b, chaps 5, 6).

The development of *pravosoznanie* in the population remains a fundamental obligation and goal of state authority. The obligations laid upon the monarchical state itself by *pravosoznanie* are conceived as fundamental, and where the monarch fails to meet these obligations Il'in sees not merely a right, but an *obligation* of disobedience on the part of the population (1979: 222-3). The authority of the monarch is thus strictly limited by natural law, but within those bounds is depicted as properly autocratic, patriarchal, grounded in spiritual authority, and giving rise to gradations of rank among the population. Paradoxically, the ultimate justification of monarchical authority lies in the fulfilment of its obligation to render itself superfluous by the development of *pravosoznanie* to the point of

genuine self-governance by the population. He supposed not that the ideal of such a state would be appropriate for every nation, but that it articulated something essential to the original Russian idea, a critically important ideal, he believed, if that nation was ever to be rescued from Bolshevism and reconstructed.

4 Ethics, aesthetics and religious thought

In 1925 Il’in published the very controversial *O soprotivlenii zlu siloiu (On Opposing Evil with Force)*, carefully reviewing the fundamental tenets of Christian moral theory and defending the claim that under certain circumstances one’s Christian duty might include using the sword to oppose evil. Having satisfied himself that the argument for this conclusion was sound, he forcefully and scornfully attacked the Tolstoian doctrine of non-resistance to evil so popular among many turn-of-the-century Russian intellectuals, characterizing it as a product of intellectual inadequacy and moral weakness of will and arguing that it was responsible in significant measure for the failure of the Russian state to defend itself against Bolshevism. The publication of this work produced a furore in the Russian émigré community, causing a division of opinion for and against Il’in that endured for many years (Il’in 1925, Poltoratzky 1975).

His principles of aesthetic criticism were first presented in *Osnovy khudozhestva: O sovershennom v iskusstve (Fundamentals of Art: On Perfection in the Arts)*(1937), and applied to some of the major Russian émigré writers in *O t’me i prosvetlenii (On Darkness and Illumination)*(1959). He regarded art as a kind of spiritual service and source of joy for the artist as well as the audience, a mode of religious experience for those capable of truly participating in it. A collection of his occasional essays and lectures on Russian writers and other aesthetic topics has also been published (Il’in, 1973).

As a deeply religious thinker and individual, Il’in tended to see a connection between most aspects of successful human endeavour and an actively lived faith. Philosophy, art, morality, law, politics and government, even science - each of these dimensions of human activity needed to be understood in connection with the divine in order to reach its perfected form. In this sense nearly all of Il’in’s major writings touched on religion in some respect. Among those devoted more exclusively to the topic of religion various emphases can be seen, such as (1) numerous occasional writings on the fate of the Russian Orthodox Church; (2) instruction and inspirational writing on the life of spirit, such as *Put’ dukhovnogo obnovleniia (The Path of Spiritual Renewal)* (1935), *Poiushchee serdtse (The Singing Heart)* (1958) and *Put’ k ochevidnosti (The Path to Manifest Truth)* (1957); and (3) his monumental two-volume work on the fundamental presuppositions of religious experience *Aksiomy religioznogo opyta (The Axioms of Religious Experience)* (1953). In this last work Il’in sought to specify the objective requirements of the fundamental ’religious act’ inherent in the Eastern Orthodox faith, and the specific ’structure of the soul’ presupposed by it and developed in it. He felt that these elementary ’presuppositions’ of faith had been left largely unexamined by theologians and were subject to degeneration and distorted comprehension in the contemporary world. Il’in’s overriding concern in all of these works was to trace the spiritual roots of the general crisis affecting Western and Russian civilization in the twentieth century and point out paths to the restoration of spiritual health for individuals and for nations.

PHILIP T. GRIER

List of works

Il’in, I.A. (1993) *Sobranie sochinenii v desiati tomakh (Collected Works in Ten Volumes)*, ed. Iu.T. Lisitsa, Moscow: Russkaia kniga. (Vol. 1 contains a bibliography listing about 350 publications by Il’in, including books, brochures, journal articles and newspaper articles, in three languages. A still more detailed and corrected bibliography can be found in vol. 2 of *Sochineniia v dvukh tomakh (Works in Two Volumes)* compiled by Iu.T. Lisitsa in the series *Iz istorii otechestvennoi filosofskoi mysli* published by Voprosy filosofii, Moscow: Medium, 1993, 1994.)

Il’in, I.A. (1918) *Filosofiia Gegelia kak uchenie o konkretnosti Boga i cheloveka (The Philosophy of Hegel as a Doctrine of the Concreteness of God and Man)*, vol. 1, *Uchenie o Boge (The Doctrine of God)*, vol. 2, *Uchenie o cheloveke (The Doctrine of Man)*, Moscow: Izd. G.A. Lemana i S.I. Sakharova.(The author himself translated all of vol. 1 and the last two chapters of vol. 2 of the original Russian edn into German and published it as a single volume: *Die Philosophie Hegels als kontemplative Gotteslehre (The Philosophy of Hegel as a Contemplative Doctrine of God)*, Berne: A. Francke, 1946. The original 1918 Russian edition has recently been republished in its entirety as a single volume (St Petersburg: Nauka, 1994).)

Il’in, I.A. (1925) *O soprotivlenii zlu siloiu (On Opposing Evil With Force)*, Berlin: privately published; 2nd edn London, Canada: Zaria, 1975.(Il’in’s argument that under certain circumstances Christian moral doctrine does justify the use of the sword to oppose evil, and his attack on Tolstoi’s doctrine of non-resistance to evil, and its consequences.)

Il’in, I.A. (1935) *Put’ dukhovnogo obnovleniia (The Path of Spiritual Renewal)*, Belgrade: Russkaia biblioteka, Kniga 43; 2nd edn Munich: privately published by N.N. Il’ina, 1962. (The original edition did not contain the last three chapters included in the second publication.)

Il’in, I.A. (1937) *Osnovy khudozhestva: O sovershennom v iskusstve (Fundamentals of Art: On Perfection in the Arts)*, Riga: Russkoe akademicheskoe izd.(The primary statement of Il’in’s aesthetic doctrine, in which he holds that great works of art and literature contain a religious/spiritual dimension of which the artist may not have been fully conscious.)

Il’in, I.A. (1953) *Aksiomy religioznogo opyta (Axioms of Religious Experience)*, Paris: privately published, 2 vols. (Il’in’s most important religious work; an exploration of the fundamental ‘religious act’ inherent in the Eastern Orthodox faith, and the specific ’structure of the soul’ required by it.)

Il’in, I.A. (1956a) *Nashi zadachi: Stat’i 1948-1954 (Our Tasks: Articles 1948-1954)*, Paris: Izd. Russkogo Obshche-Voinskogo Soiuza, 2 vols.(Il’in’s proposals for the reconstruction of the Russian state, Church and society following the collapse of Soviet regime, originally circulated as a series of 215 anonymous ‘bulletins’ by a Russian émigré organization called the Russian Joint Military Union, which collected all of the bulletins and published them together after Il’in’s death.)

Il’in, I.A. (1956b) *O sushchnosti pravosoznaniia (On the Essence of Consciousness of Right)*, Munich: privately published by N.N. Il’ina.(The initial version (1919) was revised throughout Il’in’s life. This is a work of political and legal philosophy in which Il’in explained the doctrine of ’consciousness of right/law’ and its connection with natural law as an essential element of the political/legal arrangements he thought appropriate as an ideal for a future Russian state.)

Il’in, I.A. (1957) *Put’ k ochevidnosti (The Path to Manifest Truth)*, Munich: privately published by N.N. Il’ina. (An inquiry and guide into the problem of self-evidence, or what is required for penetrating to the objective essence of a problem - of knowledge, of ethics, of spiritual life - and avoiding the blindness induced by surface appearances.)

Il’in, I.A. (1958) *Poiushchee serdtse. Kniga tikhikh sozertsanii (The Singing Heart. A Book of Quiet Contemplations)*, Munich: privately published by N.N. Il’ina, 1943.(Il’in described this as ’devoted not to theology, but to a quiet, philosophical praising of God’, to the development of a new philosophy, Christian in spirit and style.)

Il’in, I.A. (1959) *O t’me i prosvetlenii: Kniga khudozhestvennoi kritiki. Bunin-Remizov-Shmelev (On Darkness and Illumination: A Book of Aesthetic Criticism. Bunin-Remizov-Shmelev)*, Munich: privately published by N.N. Il’ina.(Il’in’s commentary on these three important writers of the emigration, illustrating his own principle of aesthetic criticism. Written 1939.)

Il’in, I.A. (1973) *Russkie pisateli, literatura i khudozhestvo: Sbornik statei, rechei i lektsii (Russian Writers, Literature and Art: An Anthology of Articles, Speeches and Lectures)*, Redaktsiia, predislovie i primechaniia N.P. Poltoratskogo, Washington: Izd. Russkogo knizhnogo dela v SShA, Kamkin.(A collection of Il’in’s brochures, lectures and speeches devoted to the literary genius of Pushkin, the spiritual art of Shmelev, literary criticism of Merezhkovskii, the Russian folktale, Russian poetry and the idea of Russia contained in it, and questions of artistic creativity.)

Il’in, I.A. (1979) *O monarkhii i respublike (On Monarchy and the Republic)*, Redaktsiia, predislovie i prilozhenie N.P. Poltoratskogo, New York: Sodruzhestvo.(This is Il’in’s primary work on forms of the political state. Not completed in his lifetime, it was assembled and edited by Poltoratzky.)

Illuminati

Begun in 1776 in Bavaria, the Illuminati were an overtly political as well as morally orientated secret organization that imitated the forms of freemasonry. While masonic lodges forbade discussion of politics and religion at their meetings, the Illuminati did the reverse. They were openly yet paradoxically secret about their irreligion and their devotion to the radical French Enlightenment; and they wanted reform in the absolutist states of Central Europe. The authorities arrested and persecuted them, but their activism foreshadows the French Revolution and a desire for more representative systems of government in Continental Europe. Despite the notoriety of the Illuminati, no more than about 600 members have been identified.

Freemasonry always promised more than it delivered. Its rules and the constitutions of Grand Lodges throughout Europe spoke of all men meeting upon the level, and of merit as the only requirement for advancement. Yet in lodge after lodge, hierarchy and social position reasserted themselves, and the Grand Lodges were, without exception, led by aristocrats. In addition the masonic lodges, particularly in the German-speaking lands, had been used by enlightened absolutists as extensions of their social influence. Frederick II in Berlin, and later Joseph II in Vienna, openly used membership as a symbol of loyalty to themselves, and of a man's willingness to work for the interests of the state before those of the clergy or the local power of old elites. It is little wonder that someone, somewhere would adopt the form and ideology of freemasonry and radicalize both. That is precisely what the Illuminati did.

Founded, not accidentally, in 1776 - the year of revolutionary upheaval in the new world - by Weishaupt (1748-1830), a professor of law at the Bavarian university at Ingolstadt, the Illuminati were overtly and dangerously political. Unlike the lodges which forbade open discussion of politics - and then subtly assumed political personae - the lodges of the Illuminati openly called for political and philosophical discussions, less hierarchy, and attention to issues of reform. Weishaupt adopted the form of the masonic lodge, issued 'statutes' as would a lodge, embraced secrecy, and called for moral reform: *'Mocht sich die alten und neuern System der Moral, Philosophie als stoischen, epikureischen…'* ('you should embrace the old and new System of Morality, Philosophy such as the stoic and the epicurean…'). Thus Enlightenment paganism was harnassed to political reform. Lessing's masonic dialogue, *Ernst und Falk* (1778), may have been partly inspired by Illuminati ideals; certainly it argued for democracy and for a set of reforms that would make societies and states less hierarchical, less sectarian, and less bellicose (see Lessing, G.E.). Lessing's argument in the dialogue centred on the notion that all he was doing was bringing freemasonry to its logical conclusion. The masonic goal of virtue and individual moral improvement was turned outward, and the mirror reflected poorly upon the absolutist principalities or the clergy favoured in them.

Again, it was not accidental that Weishaupt had been educated by the Jesuits. There had long been tension between the order and the masonic lodges. In the 1740s the leading Amsterdam freemason, Jean Rousset de Missy said that masters of a lodge would admit any man - except a Jesuit. The Illuminati were quickly locked in combat with the Jesuits who spied in them another example of masonic evil. Weishaupt argued that his brothers should do as had the Jesuits, make themselves indispensable as servants of the state. The point of this infiltration, however, would be to drastically alter the state; not to support it as had the Jesuits. Other German intellectuals were attracted to his arguments, notably the freemason Adolf Freiherrn von Knigge, who became a theorist of illuminism. The debate begun by the Illuminati and the Jesuits can be found echoed or discussed by Fichte, Schiller, and Herder.

The League of the Illuminati were strongest in Munich where von Knigge sought to use it as a vehicle to reform freemasonry and to extend its influence throughout Germany. At the height of its fame the League had no more than 600 members of which most were court and administrative officials, clergymen and military officers. They swore an oath that said 'the sole aim of the League is education, not by declamatory means but by favouring and rewarding virtue. The order of the day is to put an end to the machinations of the purveyors of injustice'.

The goals of the League provoked fear on the part of the authorities who sought to infiltrate their ranks, and eventually they arrested and imprisoned their leaders. It was said that Jesuits were also attempting to spy on the Illuminati, and what began as a small effort by a young professor in Bavaria suddenly captured the attention of the European press. The Illuminati became symbol and reality of the crisis of absolutism seen in Berlin, Paris and

Vienna during the 1780s. At its heart lay the contradictions within enlightened absolutism: How to reform the state without unleashing uncontrollable forces or allowing potential revolutionaries to gain the upper hand? The Illuminati became the Anabaptists of their era, indeed Catholic propaganda openly compared them to the radicals of Münster. For their part the German freemasons moved to distance themselves from this new hybrid. The Bavarian response foreshadows by a decade the emergence of conspiracy theory during the French Revolution. As early as the autumn of 1789 the freemasons were being blamed for events in Paris, but the background lay in the furore caused by the Illuminati and the efforts made by the German states to exterminate them.

Something discernibly modern emerged in Bavaria in 1776, only to be suppressed by 1786: groups of young men intent upon planning for radical political reform that could include the dismantling of established political authority. Equally modern was the response: conspiracy theorists surfaced who defined the world as a place threatened by dark forces possessed of extraordinary power solely by virtue of their secrecy and silence. In the process the state had come to be seen as a human institution, made by the people and not by divine will. As early as 1780 Illuminati showed how fragile the authorities of the absolutist state perceived their power and control to be; the decade of the 1790s would prove their fears to have been justified.

Illumination

The most influential theories of illumination explain certain features of our knowledge by developing an analogy with ordinary sensory vision and the role played in it by light. According to theories of this sort, our knowledge of necessary and immutable objects and truths requires the activity of a kind of intelligible light illumining objects that are purely intelligible, thereby making them 'visible' to our mind. Plato held that this light comes from the Form of the Good, Augustine that it comes from God, and others that it is intrinsic to reason itself.

The peculiar nature and behaviour of light has provided a model not just for theories of knowledge but also for philosophical accounts of fundamental features of reality. Neoplatonist cosmologies, for example, liken the genesis of the universe to the emanation of rays of light from a light source. Theories of illumination therefore can be metaphysical as well as epistemological. Both kinds of theory have their historical roots in Platonism broadly construed.

1 Epistemological illuminationism

Platonist epistemologies characteristically focus on the fact that we understand certain immutable, eternal natures (for example, the objects of geometry, such as the circle and the triangle) and know certain necessary truths (for example, that the interior angles of a triangle are equal to two right angles). They argue that we cannot have acquired knowledge and understanding of this sort through sense perception since no objects of sense perception are of the right sort to account for the necessity and immutability distinctive of this sort of knowledge. They conclude that if such knowledge is to be possible, there must be necessary and immutable objects epistemically accessible to us by means other than sense perception. Epistemologies of this sort hold that these objects are purely intelligible and that we make epistemic contact with them through reason, intellect or mind. Our understanding of the nature of a triangle (for example) and our certain knowledge that its interior angles are equal to two right angles are to be explained by our being (or having been) directly acquainted with the relevant purely intelligible object(s).

The model for this epistemically fundamental notion of direct intellective acquaintance is sensory vision. Our access to purely intelligible objects by means of reason or mind is analogous to our access to ordinary visible objects through sight. According to this analogy, there are three essential components in both the sensory and intellective cognitive processes. First, we must possess the relevant cognitive power (sight in the case of sensory vision; intellect in the case of intellective cognition). Second, there must be an appropriate object for that power (a coloured material body; a purely intelligible object). And third, there must be an agent whose activity enables the cognitive power and its object to make contact. In sensory vision, this third component - the enabling agent of cognition - is light: corporeal light (from the sun, for example) illumines material objects, making them not merely potentially but actually visible to us. In intellective cognition, there must be an analogous intellectual light whose activity makes intelligible objects actually and not merely potentially intelligible to us. Our direct acquaintance with the nature of a triangle (for example) depends essentially, therefore, not only on our intellective powers and the existence of the relevant intelligible object(s) but also on the activity of an intellectual light.

The analogy between intellectual understanding and sensory vision is superficially compelling (our ordinary ways of talking about knowledge and understanding rely heavily on it), but the metaphor of intellectual light gives rise to difficult philosophical questions. What exactly is the nature of this intellectual light? Is it something ontologically independent of us or is it identical with or merely a function of our intellectual powers and capacities? Plato's famous analogy of the sun suggests that the intellectual light has as its source the Form of the Good:

> Say, then, that it is the sun which I call the offspring of the Good, which the Good begot as analogous to itself. What the Good itself is in the world of thought in relation to the intelligence and things known, the sun is in the visible world in relation to sight and things seen…. [W]henever one's eyes are turned upon objects brightened by sunshine, they see clearly…. So too understand the eye of the soul: whenever it is fixed upon that upon which truth and reality shine, it understands and knows, and seems to have intelligence…. Say that what gives truth to the objects of knowledge, and to the knowing mind the power to know, is the Form of the Good.
>
> (*Republic* VI, 508b-e)

Later Platonists develop and extend what we might call the supernaturalist elements of Plato’s analogy. Augustine (§4), for example, typically describes the source of intellectual illumination not as the Form of the Good but as Truth itself, which he identifies with God. He holds, then, that our knowledge depends essentially on God’s activity in our souls. For this reason, his view is typically characterized as a doctrine of divine illumination.

By developing Plato’s analogy in an explicitly theological direction, Augustine intended to deepen it and weave its epistemological elements into his broad, theistic account of reality. But medieval philosophers attracted by Augustine’s Christian Platonism saw two general difficulties in his doctrine of divine illumination. First, Augustine had suggested that in so far as any particular truth is necessary, immutable and eternal, it must be, or in some way be a part of, God, since God alone is truly necessary, immutable and eternal. But in that case it seems that in grasping a truth of this sort, ordinary human knowers are in direct epistemic contact with the divine nature, a state that Christian doctrine takes to be virtually unattainable by human beings in this life. Second, in so far as Augustine’s account identified illumination with God’s activity within our minds, it seemed to make genuine knowledge a product of supernatural intervention in our cognitive lives, and so not genuinely human at all.

Medieval philosophers and theologians typically try to steer a middle course between an interpretation of Augustine’s doctrine of divine illumination that is unacceptably supernaturalist and an interpretation that leaves no room at all for divine activity in human knowing. Many preserve the doctrine essentially intact, introducing minor distinctions designed to blunt the most serious objections. Bonaventure (§7), for example, argues that our grasp of the eternal natures that are in God can be a matter of degree:

> Since, then, certain knowledge belongs to the rational spirit, insofar as it is the image of God, it follows that in this knowledge the spirit attains to the eternal reasons [that are in God]. But since, as long as it is in the wayfaring state, [the rational spirit] is not fully deiform, it does not attain to them clearly and fully and distinctly…. It is to be granted, then,… that in all certain knowledge those principles of knowledge are attained by the knower. They are reached in one way, however, by the wayfarer, and in another way by him who enjoys the vision of God [in the next life].
>
> (*Disputed Questions Concerning Christ’s Knowledge*, q.4)

But some important late medieval thinkers give the doctrine of divine illumination an essentially naturalistic interpretation; this is especially the case with those philosophers - such as Bonaventure’s contemporary, Thomas Aquinas (§11) - who are committed to an Aristotelian analysis of mind and cognition. Aquinas argues that the intellectual light that makes immutable natures actually intelligible to us must be identified with a power *in us*, otherwise the resultant knowing would not be ours. That power, Aquinas claims, is the Aristotelian agent intellect, the power of the human soul that abstracts universal natures from the material and individuating conditions that characterize the presentations of sense perception. He adapts the terminology of the doctrine of illumination to fit the structure of his Aristotelian account, calling the agent intellect a ‘light’ and thinking of its activity of abstracting universal forms as a kind of ‘illumination’. In doing so, Aquinas preserves the letter of Augustine’s position if not its entire spirit.

This naturalistic rendering of the doctrine of illumination survives into early modern philosophy in the work of philosophers such as René Descartes (§7). The foundational role he assigns to propositions that are clearly and distinctly perceived to be true (or that are shown to be true by the natural light of reason) marks Descartes’ theory of knowledge as part of the legacy of Platonist epistemological illuminationism.

2 Metaphysical illuminationism

Light’s seeming propagation of itself in all directions from its source provides the model for emanationist cosmologies and related metaphysical accounts. Plotinus (§§3, 5), for example, described the emanation of all reality from the single, unified source of being (the One) as like the emanation of rays of light from a light source. Medieval Christian philosophers, who rejected emanationism as an account of the genesis of the universe, nevertheless incorporated the notion of emanation into their explanations of various aspects of the relation between creatures and their creator. According to Albert the Great (§4), for example, metaphysical universals are like rays radiating from God, the primary intelligence and creator of all forms. These universal forms, which are in themselves simple, fall on matter (producing particular individuals) and on souls (for which they are the principles of cognition). Henry of Ghent (§§2-3) argued that a creature’s essence is related to its existence in the way a ray of

sunlight is related to the light it possesses: the ray receives its light from the sun (and so is in that respect distinct from and dependent on it), but it receives it in such a way that the ray's very nature and essence is light (and so is in this respect not distinct from it). Accounts of this sort can be thought of as developing the metaphysical side of the metaphor of illumination.

Illuminationist philosophy

Illuminationist philosophy started in twelfth-century Persia, and has been an important force in Islamic, especially Persian, philosophy right up to the present day. It presents a critique of some of the leading ideas of Aristotelianism, as represented by the philosophy of Ibn Sina (Avicenna), and argues that many of the distinctions which are crucial to the character of that form of philosophy are misguided. Illuminationists develop a view of reality in accordance with which essence is more important than existence, and intuitive knowledge is more significant than scientific knowledge. They use the notion of light, as the name suggests, as a way of exploring the links between God, the Light of Lights, and his creation. The result is a view of the whole of reality as a continuum, with the physical world being an aspect of the divine. This sort of language proved to be very suggestive for mystical philosophers, and Illuminationism quickly became identified with Islamic mysticism.

1 Origins

Illuminationist philosophy stems from the Arabic term *ishraq*, meaning ‘rising’, in particular the ‘rising of the sun’. The term is also linked to the Arabic for ‘East’, and has come to represent a specifically Eastern form of philosophical thought. It is used, especially within the context of Persian poetic literature, to represent a form of thought which contrasts with cognitive reason (*‘aql*); that is, it is taken to be intuitive, immediate and atemporal knowledge. The source of this form of thought is often identified with Ibn Sina’s ‘Eastern Philosophy’ (*al-hikma al-mashriqiyya*), a text about which there is a great deal of dispute and discussion, and which may never have actually existed. It is supposed to represent Ibn Sina’s departure from Peripateticism and his attempt to construct a new and deeper philosophical system (see Islam, concept of philosophy in §2).

The real originator of illuminationist philosophy is al-Suhrawardi, a Persian philosopher of the twelfth century AD, who composed over fifty works but who is chiefly remembered for his brief *Hikmat al-ishraq (The Philosophy of Illumination)*. In this book, al-Suhrawardi (in Persian, Sohravardi) adopts some of the main principles of Peripateticism (*al-falsafa al-mashsha’iyya*), but also sets out to challenge others. He criticizes Peripatetic approaches to a wide variety of topics, in particular quantification, the confusion between ‘term’ and ‘utterance’, the notion of amphiboly, petitio principii and many other issues (see Aristotelianism in Islamic philosophy). There is a marked similarity between his critique and that of William of Ockham, who also identifies in his *Summa logicae* what he regards as ten fallacies in Aristotelian logic. Both al-Suhrawardi and Ockham rearrange the parts of the Organon and omit from their discussions some of the books.

2 Logic and semantics

Illuminationist philosophy challenges the Peripatetic position of the absolute, unchanging and universal validity of the truths discoverable by Aristotelian methodology (see Peripatetics). It sets out instead to construct a system applicable to the whole continuum of being, including what is called ‘immediate knowledge’. Al-Suhrawardi rejects Aristotle’s theory of definition, arguing that there is no criterion for the parts of a definition (the genus and the differentia), and so the species is defined in terms of something less known than itself. He goes on to claim that some of the Aristotelian categories are superfluous, since action and passion are modes of motion, and possession and posture are kinds of relation. Thus we need only five categories instead of ten, leaving substance, quantity, quality, relation and motion.

The basis of al-Suhrawardi’s approach is really Stoic and Megaric (see Stoicism; Megarian school). According to this approach, the denotation (the external object) should be compared with the thing, the sign should be compared with the utterance and what is signified should be compared with the meaning. These semantic notions are used to define the relation between the first atemporal act of thought and the second temporally-extended grasp of the thing known, its essence (Ziai 1990: 42-). This involves the development of a theory of types of signification, relation of class names to constituents of the class, types of inclusion of members in classes, and a well-defined theory of supposition.

In the illuminationist view of logic, a conclusion reached by using a formally established syllogism has no epistemological value as a starting point in philosophical construction. For a universal affirmative proposition to have philosophical value as a foundation of scientific knowledge, it must be ‘necessary and always true’. Yet if we

introduce the mode 'possibility' and give it an extension in time as in 'future possibility', the universal affirmative proposition cannot be 'necessarily true always'. This is because of the impossibility of knowing or deducing all possible future instances. The epistemological implication of this logical position is that formal validity ranks lower than the certitude obtained by the self-conscious subject who, when alerted to a future possible event through 'knowledge by presence', will simply 'know' it. The future event cannot be deduced at the present time *and* given universal validity (see Logic in Islamic philosophy).

3 Epistemology and ontology

The crucial notion for Illuminationist epistemology is knowledge-by-presence (*al-'ilm al-huduri*). This identifies an epistemological position prior to acquired or representational knowledge (*al-'ilm al-husuli*). This has often been related to intuitive knowledge, and results in attempts to unravel the mysteries of nature not through the principles of physics but through the metaphysical world and the realm of myths, dreams, fantasy and truths known through inspiration. The distinction between scientific knowledge and knowledge-by-presence is crucial for al-Suhrawardi, who claims that the essence of human beings lies in their self-awareness, through the luminosity of their own inner existence (see Epistemology in Islamic philosophy; Science in Islamic philosophy).

This approach also has implications for ontology. Illuminationism defends the 'primacy of quiddity'; it sets itself up against both Aristotle and Ibn Sina in upholding the priority of essence over existence. Some philosophers uphold the primacy of being or existence, and consider essence to be a derived mental concept, while those who adhere to the primacy of quiddity consider existence to be a derived mental concept. If existence has a reality outside the mind, then the real must consist of the principle of the reality of existence and the being of existence, which requires a referent outside the mind. Its referent outside the mind must also consist of two things, which can in turn be subdivided, and so on ad infinitum. That is, if 'existence' denotes an existent, then there must be another 'existence' connected to it which makes it real, and if so then this would also apply to the second 'existence', which leads to a vicious regress. To avoid this absurdity, we must regard existence as an abstract and derived mental concept; existence cannot signify an actual entity. If there were a distinction between a substance external to the mind and its existence, it would exist by accident, since two external substances must have different essences and cannot be distinguished by being existents. In that case, existence is nothing but a mental idea and cannot be defined. Since existence is attributable to many things, it must be mental (see Existence).

4 Light

Illuminationism is distinguishable from Peripateticism through its semantics, logic, epistemology, ontology, the priority of the intuitive over the purely noetic, and also its use of a language of light entities to describe the whole continuum of reality. The latter consists of four things: intellect, soul, matter and a fourth realm named the *'alam al-khayal*, which is similar to Platonic Forms except that entities in it are continuous with the whole of reality. This fourth realm (translated by Corbin as the '*mundus imaginalis*' (Corbin 1971)) is describable as that of 'things as ideas' prior to taking on shape, that is, before they receive 'luminosity' from the One Source, the Light of Lights. The light received is essentially the same, and the luminous thing differs from other light entities only in respect of degrees of intensity. Luminosity flows eternally, and gives shape to the forms, thus making the entity 'visible' and known. The difference between things, then, lies not in their essences but in terms of the degrees of intensity of the shared essences of the things. All luminous things constitute an aggregate whole and are coeternal with the Light of Lights. The Light of Lights is one, but is neither beyond being nor nonbeing, nor does it have a will. Everything in the continuum is generated from the Light of Lights and shares a degree of light similarity. The Light of Lights is one with respect to all possible modes, known or discovered subsequently.

These highly suggestive references to light were taken up by a large number of later thinkers who developed it in different but connected ways. According to Nasafi, the existence of God is an infinite light, the existence of which is equivalent to its essence, and everything which exists is a face or expression of this light. God is the ultimate reality of everything which exists in the universe. Baba Afdal Kashani argues that the notion of being is more general than the notion of existence, since we can wonder whether a thing actually exists; being is then prior to existence, and experience of the light of God's creation is comprehended solely through an internal illumination of the soul. This results not in knowledge of a fact or thing, but rather in a way of relating to God, a way which maintains one's status as part of the deity. One of the key aspects of Illuminationism is its disinclination to make a sharp distinction between God and that which God has produced. This is what has made Illuminationist philosophy

seem so close to mysticism at times, and it leads to a sharp differentiation from aspects of Ash‘arite thought, such as adherence to the atom as the basic constituent of physical reality.

5 The character of Illuminationist philosophy

The influence of Illuminationist philosophy on the Islamic world persists to this day. A wide range of important thinkers including Nasir al-Din al-Tusi, Shams al-Din Shahrazuri, Sa‘d Ibn Kammūna, Qutb al-Din al-Shirazi, Jalal al-Din al-Dawani, the School of Isfahan and, right up to our own day, Ha’iri Yazdi, are clearly within this tradition of philosophy. When it comes to issues of interpretation, there is a controversy as to how close this form of philosophy really is to mysticism. Some writers such as Izutsu (1971), Rahman (1975) and Ziai (1990), stress its links with analytical thought and deny that there is anything particularly mystical about it. It is certainly true that the greatest interest has been focused on a relatively small number of al-Suhrawardi’s works which have more of an esoteric nature, while his more technical and strictly logical works have tended to be ignored.

The work of Henry Corbin (1971) and Seyyed Hossein Nasr (1964), on the other hand, emphasizes the mystical contribution which Illuminationism makes, and they see the esoteric aspects of this form of thought as being of leading significance. There is no doubt that the general use to which Illuminationist philosophy has been put often involves mysticism, and there is little difficulty in combining it with the thought of Ibn al-‘Arabi, for example, which later philosophers were to do. It is certainly true that some of the leading texts by al-Suhrawardi are entirely technical and deal with issues of philosophy which have no mystical dimensions, but it must be admitted that when one examines his general approach to metaphysics, it clearly fits in with many of the ideas which mystics like to use. The terminology of light points to a view of the nature of reality which is far removed from that presented by the Peripatetics, or even from Ibn Sina in his more suggestive and mystical moods. Illuminationism is not just a critique of Aristotle and Ibn Sina, but it is also the development of an original metaphysical model which has subsequently proved very fruitful within the Islamic world.

Imagery

Most philosophers prior to the twentieth century thought of mental images as inner pictures, along lines suggested by introspection. But there are obvious differences between mental images and pictures. The former have no objective size or shape, for example. These differences have led some philosophers to argue that mental images are more like linguistic descriptions. The descriptional view of images is also taken by some cognitive psychologists. Other psychologists maintain that the pictorial conception of images provides the best explanation for the results of a number of intriguing experiments on imagery.

Are the front legs of a kangaroo shorter than its back legs? Questions like these typically prompt people to form mental images, which they then inspect before answering. But just what are mental images?

Introspection suggests that images are inner pictures. And that is how most philosophers prior to the twentieth century thought of them. According to this view, held by Aristotle, Descartes and the British Empiricists, visual images are significantly like pictures in the way that they represent things in the world (see Empiricism). Notwithstanding its widespread acceptance, the picture theory of mental images was left largely unexplained in the traditional philosophical literature. Images were taken somehow to resemble the things that they represent, but little more was said.

In the twentieth century the pictorial view of mental images has been the target of numerous philosophical objections. It has been noted that mental images are not seen with real eyes; they have no objective weight or colour. What, then, can it mean to say that images are pictorial? Moreover, mental images seem indeterminate in ways that pictures are not: for example, a mental image of a striped tiger need not represent any definite number of stripes. But an ordinary picture of a striped tiger must be determinate with respect to the number of stripes.

Finally, there have been attacks on the evidential underpinnings of the pictorial theory. The introspections on which belief in images is often based are taken to reveal much less about the mind than was traditionally supposed. In particular, it has been argued that what introspection really shows about visual images is not that they are pictorial, but only that what goes on in imagery is experientially much like what goes on in seeing (see Block 1983; Introspection, psychology of).

Perhaps the most influential alternative to the pictorial view in philosophy has been an approach that is now standardly known as 'descriptionalism'. The basic thesis of descriptionalism is that mental images represent in the manner of linguistic descriptions. They are complex representations, structurally like descriptions, within some neural code - representations that are the objects of computational procedures. So, descriptionalism about images is often taken to go hand in hand with the classical computational model of the mind (see Language of thought; Mind, computational theories of).

Descriptionalism remains popular in philosophy today (see, for example, Dennett 1981), and it also has significant support in contemporary psychology, where it has received its clearest articulation (see, for example, Pylyshyn 1981). Nevertheless in recent years the pictorial view has been making a comeback. In response to a large corpus of experimental data on imagery, psychologists such as Stephen Kosslyn (1980, 1994) have developed an empirical version of the pictorial view that seems more promising than any of its philosophical predecessors.

Kosslyn hypothesizes that the imagery medium, which he calls 'the visual buffer', is shared with visual perception. Each cell in the medium represents a tiny, just noticeable patch of object surface. He begins by conceiving mental images on the model of displays on a cathode ray tube screen attached to a computer. Such displays are generated on the screen by the computer from information that is stored in the computer's memory. This display is spatial and it is made up of a large number of basic units or cells, some of which are illuminated to form a picture. Analogously, according to Kosslyn, mental images may be regarded as functional pictures in a functional spatial medium made up of a large number of basic units or cells, that is, they function with respect to the representation of relative distance relations *as if* they were screen displays, even though, in reality, they need not be laid out in the brain with just the same spatial characteristics as real displays.

This last point is significant, if Kosslyn's view is to be properly understood. Even though the initial model for

mental images is provided by screen displays, there is an important respect in which images are *not* like such displays. The displays make no difference to the functioning of the machine. If the screen is shattered, for example, the machine will go on computing just as it did before. The displays are there for *us*, not for the machine. But that is not the case for mental images. They are critical to many cognitive tasks. On Kosslyn's view, mental images are really more like the internal arrays or matrix-like representational structures that computers sometimes manipulate, rather than the external screen displays. So, according to Kosslyn, there is nothing in the computational model of mind that commands adherence to descriptionalism. To be sure, computers manipulate internal descriptions, but they also manipulate internal, picture-like representations too.

This view is motivated by many intriguing experiments, of which I can mention only two. Kosslyn found that when people are told to form mental images of a map, which they have studied carefully, and to focus on one part of the image, the time it takes for them to shift their focus to another part of the image increases linearly with the distance apart of the objects on the map corresponding to the image parts. Kosslyn claims that this experiment shows that mental images can be scanned at fixed speed. This, in turn, is taken to support the pictorialist hypothesis (see Tye 1991).

In another experiment, Shepard and Metzler (1971) discovered that when people were shown drawings of pairs of block figures at different orientations, and were asked whether the members of each pair were congruent, the time it took the subjects to respond increased linearly with the angular separation of the figures. This experiment strongly suggests that mental images can be rotated (again at fixed speeds). This also fits in nicely with the view of images as having a picture-like (or array-like) character.

Not all cognitive scientists agree with pictorialism, however. According to Pylyshyn, Kosslyn's experiments on imagery can be explained by reference to the task demands placed on subjects by the experimenter's instructions together with facts the subjects already tacitly know, for example, the fact that it takes longer to scan greater distances with the eyes. No inner picture-like entity is needed.

It is far from clear that the appeal to tacit knowledge can explain all the imagery data, contrary to Pylyshyn's claim (see Kosslyn 1981). There are, however, other descriptional theories of imagery that have no need of the doctrine of tacit knowledge (for example, Hinton 1979). These versions also do well in explaining the results of Shepard and Cooper's rotation experiment. So, descriptionalism cannot be refuted simply by attacking the doctrine of tacit knowledge.

Imagination

'Imagination' and 'imagine' enjoy a family of meanings, only some of which imply the use of mental imagery. If I ask you to imagine a red flower, I will likely be inviting you to form an image. But if, for example, I say that I imagine that I will go to the party after taking a nap, I am not obviously giving voice to mental imagery. A variety of questions has arisen concerning imagination in its various forms, of which the following four are central. How do internal acts of imagining come to be about particular external objects and states of affairs, actual and non-actual? How are perceptual acts similar to and different from the central cases of imagining? To what extent does routine perception and cognition use similar cognitive resources to creative imagination? Are there any cognitive pursuits in which imagination can play a justificatory role?

1 The intentionality of imagination

The noun 'imagination' and the verb 'imagine' have a family of meanings rather than a single, sharp, meaning. We may use 'imagination' to indicate an ability to form images of things. Alternatively, 'imagination' can take on a more normative use, to indicate a measure of inventiveness, as when we say that something was done with imagination. Turning to 'imagine', we sometimes use that verb to describe image formation, sometimes as an indication of speculation ('I'd imagine that Jack the Ripper was responsible'), sometimes as an expression of surprise ('Imagine!'), sometimes to attribute error ('He imagines that Mars is the planet closest to the sun'), sometimes interchangeably with 'conceive'. Clearly, not all of these uses directly connote the use of mental imagery.

Exercises of the imagination have intentionality - that is, they are about objects, events and situations, actual and non-actual. We can imagine our best friend, a golden mountain, falling off a ladder, or that Martians visit Earth in the year 3000 (see Intentionality). Imaginings have not taken centre stage in twentieth-century philosophy of mind, which, perhaps regrettably, has tended increasingly to focus on belief and desire in its discussions of intentionality. Yet philosophers directly concerned with imagination have typically felt the need to provide an account of its intentionality. Taking those exercises of imagination that involve mental imagery as central, some have tried to explain the intentionality of imaginings in terms of the intrinsic properties of mental images, usually their pictorial properties. This approach is widely recognized as problematic. Even those who are willing to reify mental images recognize, first, that one cannot explain their intentionality by appealing to pictorial properties - pictorial properties cannot explain my imagining *my* cottage rather than another one that looks exactly like it - and, second, that there are plenty of mental acts that we call imaginings where mental images do not seem to be at play at all. As a result, accounts of the intentionality of imaginings have, increasingly, appealed to features other then the intrinsic properties of images - some to intentions that lie behind images, some to the mental activity of entertaining propositions, some to similarities between episodes of imagining and episodes of seeing, so that one imagines x just in case one is in a situation that is relevantly similar to seeing x. Of course, since 'imagine' has a variety of meanings, we need not require or expect that a single account will cover all exercises of imagination.

Many imaginative actions also have intentionality. For example, we can, by acting a certain way, make believe that a broom is a horse. It is natural to think that private mental episodes of imagining are conceptually primary, and that we can understand the intentionality of such actions in terms of the private imaginative episodes that cause them. This natural view has not gone unchallenged, however. Those of a more behaviouristic bent tend to recoil at the idea of private mental imaginings that are relatively inaccessible from a third person, and which could, in principle, be divorced from any link whatever to behaviour (see Behaviourism, Analytic; Privacy). An important source of broadly behaviourist ideas, Gilbert Ryle's *Concept of Mind* (1949), offers a package that eschews the existence of mental images before the mind's eye and instead takes *activities* of make-believe and pretence as the starting point for an account of imagination.

2 Imagining and perceiving

Paradigmatic cases of imagining seem to be akin to the act of seeing something. Aristotle (*On the Soul; On Dreams*: *c*.360s bc-320s bc) was sufficiently struck by the similarities between imagining and perceiving to claim that both were movements within the single faculty of sense perception.

One similarity that has drawn the attention of philosophers is that of perspective. Paradigmatically, we adopt a particular perspective when we imagine things. Just as it is difficult to see the front and back of a house at the same time, it is difficult to imagine the front and back of a house at the same time. This has been an important datum in discussions of imagination. It has been used in favour of the reification of mental images with pictorial properties, whereby the need for perspective in imagination can be likened to the need for perspective in a painting. And it has been used against the view that paradigmatic cases of imagining can be thought of as the mere entertaining of a set of propositions, for the reason that the entertaining of a set of propositions seems no more restricted to a single perspective than a set of architectural descriptions in a book.

While obviously similar, there are, equally obviously, differences between paradigmatic cases of imagining something and perception. The most obvious difference is external to the agent: when one perceives a thing, that thing will tend to figure in the explanation of the perceiving, but when one imagines a thing, it will typically be inappropriate to invoke that thing in an explanation of the imagining. But there are also differences of a phenomenological kind between imaginings and perceivings, differences that can be sensed from the first person point of view. One difference that has often been highlighted - by Aristotle (*On The Soul; On Dreams*), Sartre (1948) and Wittgenstein (1953), for example - is this: imaginings seem subject to the will, perceivings not. This point can be pushed too far. For there do seem to be cases where one's imagination runs riot (to the extent that one's imaginings may be involuntary), and yet there is something quite right about the idea that I can ask you to imagine something in a way that I cannot ask you to perceive or believe something. Other differences between imaginings and perception have been explored. A common idea is that imaginings involve the entertaining of thoughts that are neither affirmed or denied, whereas both perceiving and believing involve taking something as true. Sartre offers a rather different account. When one perceives x, he explains, the presence of x is posited by the perception. When one imagines x, not only is the presence not posited, but its *absence* is posited. For Sartre this contrast is an important clue to the nature of consciousness: the presence posited by perception is used to account for our sense of 'being-in-the-world', the posited absence by imagination being the fundamental exercise of freedom, whereby one withdraws from the world.

3 The imaginative and the routine

When a child comes to recognize dogs as dogs, does it use similar cognitive resources to those used by an artist who comes to see a cloud as a camel? An important theme among some philosophers of the imagination has been the idea that the cognitive faculties, skills or phenomena at work in our adventures of the imagination are also very much involved in the most routine episodes of cognition. In Hume, for example, ordinary categorization of things into kinds and the belief in independent continuous objects are attributed to the very faculty - imagination - that is responsible for storytelling. This faculty, we are told, makes faint copies of perceptions, recombining them in accordance with certain associative habits that Hume sets out to specify.

In Kant, the current theme is even more at work: perceptual experience cannot properly be thought of as a passive registering of information but, rather, requires that one actively apply concepts to sensation so as to see the world as this way or that, an activity for which imagination is responsible (though no implication of illusion is intended). Taking one's sensations as perceptions those of a dog is apparently treated by Kant as importantly analogous to the child's playfully seeing a broom as a horse. Kant's imagination has two species: reproductive, whereby one sees something as being of a kind with something one has previously seen; and productive, whereby a priori concepts are brought to bear upon experience.

In finding continuities between the creative and the routine, one should not obliterate that distinction. One particular kind of exercise of the imagination that calls out for special treatment is the aesthetic variety. While giving imagination an extremely broad role to play, Kant was well aware that there is something distinctive about the aesthetic exercise of the imagination and sought to explain what that was. His central idea was that aesthetic imagination, while thought-provoking, takes us beyond the cognitive domain provided by our concepts. This idea proved crucially important to those Romantic thinkers after Kant who sought to use the aesthetic imagination as the grounding for fundamental metaphysics (see Romanticism, German §3).

Both Kant and Hume use 'imagination' in an extended and thus unusual way in order to emphasis the putative continuities between the creative and the routine. A number of later writers such as Peter Strawson (1970) and Mary Warnock (1976) have also, in various ways, explored the continuity of imagination with humdrum

perception and cognition, though there has been a move away from the idea of explaining the continuity in terms of a single faculty - an organ of the mind - that does various sorts of creative and humdrum work.

4 The justificatory role of imagination

It is important to cognitive excellence that we cultivate imagination in all areas of inquiry. Even in science, it is clear that fruitful inquiry requires an ability to imagine what an explanation for some given phenomenon might look like, imaginatively to see familiar things as somehow representative of theoretical phenomena, and so on.

Granting that imagination is a source of cognitive inspiration, a further question concerns the extent to which an exercise of the imagination can *justify* various kinds of beliefs.

One interesting test case here is provided by geometry, where some thinkers, including Kant and J.S. Mill (1843), have accorded spatial imagination an important justificatory role, while others have insisted that it is merely a useful aid to the geometer.

Meanwhile, in discussions of possibility and necessity, considerable attention has been given to Hume's idea that whatever can be imagined is possible. Hume himself wielded this idea against any putatively necessary link between cause and effect, arguing that one can always at least imagine the cause without the effect. The crucial issue here is whether there is a sense of 'imagine' that can hold the various strands of the Humean view together. If 'imagine' means 'form a mental picture', as in a story, we can well doubt whether an ability to imagine something can justify our believing it possible, because the standards of propriety that we apply when telling stories are quite different to those we apply when the question of genuine possibility is at stake. We may also note in passing that it seems clear that there are possibilities we cannot picture. Meanwhile, there is a use of 'imagine' that is conceptually linked to possibility, but in that sense it is far from clear that I can imagine, say, eating every living creature on this planet.

Finally, in ethics, some (for example Johnson 1985) have suggested that an exercise in imagination is important to the rational evaluation of competing ethical claims. The idea is that the weighting and choice of values, as well as, perhaps, the concrete deployment of abstract or metaphorical moral principles, requires some sort of imaginative engagement with relevant possible situations.

Immanuel ben Solomon of Rome (*c*.1261-before 1336)

Immanuel of Rome wrote commentaries on the Bible and poems of a religious, philosophical or jocular nature, concerning the most varied themes. His main topics are conjunction with the 'active intellect' and the superiority of theoretical knowledge. He participated in many of the leading controversies of his time and is interesting for the ways in which he managed to express theoretical ideas poetically.

Immanuel ben Solomon ben Moses ben Jekhutiel was born in Rome and probably studied at the school (*bet midrash*) of Zerahiah ben Isaac Gracian of Barcelona. In 1290-1, during a controversy between Zerahiah Gracian and Hillel ben Samuel of Verona on the origin of human language and the rationalistic interpretation of biblical miracles, he sided with the former, writing a polemical letter to Hillel. Following the loss of his property, he left Rome and lived in various towns including Ancona, Perugia and Camerino. At Fermo he found shelter at the house of a patron, who requested that he assemble his scattered verses in a book. After a short time, however, he left for reasons unclear. Immanuel's father-in-law, Rabbi Samuel, was a well-known representative of the Jewish community of Rome. He was probably part of the mission sent by the community to obtain from the Pope, based at that time in Avignon, revocation of the decree of expulsion of the Jews from the Church's territory. After the murder of Rabbi Samuel in 1321, Immanuel sojourned in the towns of Perugia, Orvieto and Ancona and also visited Gubbio and the court of Can Grande della Scala in Verona. Following the revocation of the papal decree, he passed several years in Rome and then returned in 1328 to the house of his patron in Fermo.

In his vast literary-exegetic production Immanuel displays an encyclopedic knowledge, from the biblical and rabbinic literature and the oldest Hebrew mystical works, to such disciplines as poetry, grammar, rhetoric, music, astronomy, mathematics, medicine and philosophy. Belonging to the Aristotelian school, although introducing certain ideas drawn from the Neoplatonists, he deals with the entire gamut of philosophical topics in his exegetic commentaries. If from a literary point of view he is influenced by his immediate environment, in particular the Italian school of *dolce stil nuovo*, be it in the ideas or in style, introducing the fourteen-line Petrarchian sonnet to Hebrew poetry (while applying Arabic metre to the Italian verse), from the philosophic point of view, as is seen in his vast exegetic production, he is part of the Maimonidean-Tibbonian movement.

In his exegetical works, he continues in the tradition of the Tibbonids, adopting some of the formal components of the European university teaching method of the twelfth and thirteenth centuries: a great part of each commentary is actually devoted to the work of previous scholars and only a small part to original exegesis of the text, in accordance with the fourfold division of the role of the writer defined by the Latin scholastics (*scriptor*, *compilator*, *commentator*, *auctor*). In his *Perush ha-Torah (Commentary on the Pentateuch)*, Immanuel, under the influence of Abraham ibn Ezra's hermeneutical method, gives a fivefold interpretation of the verses: the Aramaic translation, a grammatical analysis, a literal interpretation, a philosophical interpretation, and a mystical or esoteric explanation. In his other biblical commentaries as well, he begins with a grammatical analysis of the verse, followed by an exposition of the literal and then the philosophical-allegorical meaning, frequently offering several interpretations for the same verse. In the philosophical section of *Perush le-be-Reshit (Commentary on Genesis)*, Immanuel interprets the creation of the sublunar world naturalistically. He also addresses topics such as time, motion, the nature of the spheres, the nature of light as identified with the celestial matter (Aristotle's fifth element), the nature of the prime matter, the concept of the creation existing for the sake of man, the origin of human language, the superiority of the Hebrew language, the doctrine of prophecy, and the role of the imagination in the prophetic revelations.

There are links between his poetical and exegetical-philosophical works. In his best-known literary work, *Machberot (Compositions)*, he often expresses himself in allegorical language, characteristic of the Maimonidean-Tibbonian school, in order to convey the same philosophical themes that occupy much of his exegetical commentaries, such as the influence of the heavenly bodies, the cognitive process of the human rational soul and the immortality of the human soul. The *Machberot* are organized as a dialogue between the author and a prince. Scholars are inclined to see in the prince who converses with Immanuel a symbol signifying the 'active intellect', with which the potential intellect of the poet strives to unite. These topics return frequently in the exegetic writings, in which Immanuel repeatedly emphasizes the superiority of intelligible knowledge, of which

the highest degree of perfection is represented by the conjunction of the potential intellect with the last of the separate intelligences, namely, the active intellect. It is precisely this conjunction of the potential intellect with the active intellect, allegorically symbolized by the union between the lover and the beloved, that constitutes the main topic of *Perush le-Shir ha-Shirim*, his philosophical commentary on the Song of Songs.

Immutability

The doctrine of divine immutability consists in the assertion that God cannot undergo real change. Plato and Boethius infer divine immutability from God's perfection, Aristotle from God's being the first cause of change, Augustine from God's having created time. Aquinas derives divine immutability from God's simplicity, his having no parts or attributes which are distinct from himself. All of these arguments finally appeal to aspects of God's perfection; thus, the doctrine of divine immutability grew from a convergence of intuitions about perfection. These intuitions dominated Western thought about God well into the nineteenth century.

The doctrine's foes argue that God's power, providence and knowledge require its rejection. Their arguments contend that since the world does in fact change through time, this must entail change in God. If God responds to changing historical circumstances and to prayers, that would seem to require some sort of change in him (from not responding to responding). And if he does not intervene to prevent a war, for example, then after the war, he will have lost the power to prevent it (assuming, as many do, that God cannot alter the past), so again there is a change of state. Finally, it is argued that God's knowledge of tensed truths (for example, 'it is now noon') must change as what time 'now' is changes. Some responses to these arguments appeal to the claim that God is in some sense outside time.

1 Introduction

From Philo of Alexandria to the nineteenth century, 'classical theism' ruled Western thought about God, at times without challenge. Prominent in classical theism was the doctrine of divine immutability, that God cannot change in nature, character, intentions, knowledge or any other respect. In such writers as Augustine and Aquinas, God is eternal because he is immutable, and eternality is God's distinctive mode of being. So the doctrine of divine immutability is at the roots of such writers' understandings of God's nature.

The doctrine consists in the assertion that God cannot undergo real change, such as the change involved in learning, growing or reddening. Divine immutability does not entail that God cannot begin or cease to exist, if these are not real changes in the thing which begins or ceases. Nor does it rule out purely extrinsic changes in God, changes such as becoming admired. A thing changes purely extrinsically when it gains a property due entirely to real change in some other thing (see Change §1). The doctrine allows that God becomes creator of a new creature when Moses is born. But it insists that this change in God is purely extrinsic. God always willed that Moses be born at *t*. When *t* arrived, his will took effect in real changes in Moses, his parents, and so on. But the only change in God was that he came to deserve a new title, Creator of Moses.

The doctrine of divine immutability is distinct from the doctrine of divine impassibility. Nothing external can affect an impassible entity. Something could be impassible but mutable if it could change itself, but nothing else could change or affect it. Again, God could be immutable but not impassible. An unchangeable God could feel such responsive emotions as love, pity and compassion. But he would feel them without change and so always feel them. If temporal, such a God would pity our pain before, while and after we suffer. If timeless, such a God would pity our pain timelessly - but responsively, because of our pain. Thus, the doctrine of divine immutability need not 'depersonalize' God.

Western Scriptures insist that God is unchanging in some respects: if he makes a promise, he never alters his intent to keep it, and his basic character (benevolence, holiness, great power) never alters. But Western Scriptures seem to conflict with full divine immutability. Some scriptural texts depict human sin as saddening God and so changing his feelings (for example, Genesis 6: 6), then bringing God to new decisions - for example, to flood the world. According to John, 'the Word became flesh' (1: 14), that is, God took on a human nature he did not always have. The doctrine of divine immutability appears in theologies which take Western Scriptures as authorities. It thus is worth asking why Western theism has so strongly endorsed the doctrine, given that its scriptural roots seem to deny it.

2 The case for immutability

The answer lies in the philosophical sources and methods of Western religious thought. Western thinkers have largely followed the method of perfect-being theology, filling out the concept of God by ascribing to him the

properties he must have to count as absolutely perfect (see God, concepts of §§2-6). God's perfection seems to rule out many sorts of change. If perfect, God is all-knowing. If God learns something new, then before that he was not all-knowing. If God changes his plans, either he did not anticipate what makes him change them and so was not all-knowing, or he was not perfectly wise in making his plans, or he is not perfectly wise in changing them now. So if God is *necessarily* all-knowing and perfectly wise, God *cannot* change in these ways. More general arguments convince adherents of perfect-being theology that God cannot change in any way.

Plato's Theory of Forms inclined many to believe in divine immutability (see Plato §§10-14). In the *Phaedo* and elsewhere, Plato takes the Forms to be perfect cases of themselves - for example, the Good is a perfectly good thing - and associates the Forms' perfection with their immutability. Theists' liking for Plato's views disposed them to see perfection Plato's way. Plato argues specifically that God cannot improve or deteriorate: if God is already perfect, God cannot change for the better, and being perfect includes being immune to change for the worse (*Republic* II 381b-c). Plato ignores value-neutral changes. But there may be some; is it good or bad to become a nanosecond older? Still, God would undergo value-neutral change either voluntarily or involuntarily. If involuntarily, then either God wishes not to change but cannot avoid it, or God does not care whether he changes, but is subject to forces or conditions he does not control. Either way, God's power seems less than perfect. If voluntarily, God is less than perfectly rational, since he does or undergoes something with literally no value, and hence for which there is no good reason. (If God creates time and thereafter grows older, the good for which he creates time is reason to let himself grow older, and so growing older is not value-neutral.)

Many medieval theists accepted Aristotle's 'cosmological' argument for God's existence (see Aristotle §16; God, arguments for the existence of §1). Aristotle reasoned that if change occurs, change has a final source, an eternally unchanged changer (*Physics*). He also argued that something is eternally unchanged only if unchangeable (*De caelo*). Later theists thought the role of first cause of change too lofty not to be God's. Writers who took Aristotle's argument or its variants to prove God's existence found themselves committed to divine immutability.

Augustine (§§7-8) developed Plato's thoughts into an ontology of degrees of existence. As he thought that to exist is to be present, his ontology was also of degrees of presence. Augustine thought immutable things most present. For a thing which changes realizes its nature gradually and never at any point has all the attributes it ever has; a human gains adult stature only by losing the distinctive charms of childhood. A thing which *can* change never actually has all the attributes it possibly has. If a thing is immutable, its entire character and nature are present at any moment: it always is all it can be. Thus, it is more fully present than changing things. So if existence is presentness, immutable things have a higher degree of existence than mutable things. As only highest existence is appropriate to a perfect being, perfect-being theology thus led Augustine to divine immutability.

Augustine also argued specifically (in *The Literal Meaning of Genesis*) that by creating temporal things, God created time itself. As free creator of time, God is intrinsically outside time (as Philo of Alexandria (§5) too saw, in *On the Unchangeableness of God*). But only things which exist in time can change. Hence, if God is intrinsically beyond time, God is intrinsically changeless. Augustine's understanding of God's role as Creator, then, led him to divine timelessness and so to divine immutability. One might move to divine immutability via timelessness today from the widely accepted premises that God is not located in space and (on a standard reading of Special Relativity) things are in time only if in space (see Time §3).

Temporal beings no longer live the past parts of their lives, losing them forever, and still lack the future parts of their lives. A.M.S. Boethius (§5) saw these traits as defects. So he inferred via perfect-being theology that God has no past or future, living his life in a pure present (see Eternity). What has no past or future does not change. For what changes goes from what it was to what it then was going to be, and so has a past and a future. Hence, for Boethius, perfection required changelessness. If it does, necessary perfection - which is better than contingent perfection, and so by perfect-being theology is God's - requires being immutable.

Aquinas (like Augustine) derived divine immutability from the deeper classical theist doctrine of divine simplicity (*Summa theologiae* Ia 9.1). If God is simple, God has no parts of any sort, including distinct attributes. Something which changes becomes partly different (else there was no change) and stays partly the same (else there was not change in one selfsame surviving thing; instead, one thing disappeared and another replaced it). So only things with parts can change. If so, a simple God cannot change. Divine immutability's connection with divine simplicity and the classical theist theory of God's perfection which centres on divine simplicity is one of the deepest reasons

for its broad historical appeal; hence one cannot fully explain what moved thinkers to accept it without also treating the motivation for the doctrine of divine simplicity (see Simplicity, divine).

The doctrine of divine immutability was accepted, then, as intuitions about God's perfection and creatorhood came together with the seeming availability of arguments proving an unchangeable First Cause's existence. This convergence of intuitions and arguments from varied sources was the equivalent in philosophy of confirmation from independent tests in science: it strongly warranted belief in divine immutability.

3 The case against immutability

Direct challenges to the doctrine of divine immutability have rested on Scripture and on God's providence, power and knowledge. Scripture depicts God as changing, and so some who read it literally reject divine immutability. Facing such texts, friends of the doctrine defuse the appearance of divine change by appeal to doctrines less speculative and theoretical than divine immutability. Thus, Philo argues from God's foreknowledge of the future and constancy of character that God cannot repent or feel regret, as the Flood story suggests (*On the Unchangeableness of God*). Divine immutability's friends also stress the strengths of the overall theory (classical theism) that includes the doctrine; theories' overall virtues can be good reason to interpret data in a way one might not otherwise consider.

Providence. Believers in divine providence think that God answers prayers and acts in history. Parting the Red Sea (for instance) was a new act in response to historical developments. God first was not doing it, then did it. Thus, God's providence seems to involve him in change, partly because he responds to changes (see Providence §1).

Divine immutability's partisans again respond to this by appealing to less theoretical theistic doctrines. They argue that before making the world, God knew what would or might occur and what would or might be prayed if he made it. Thus, God never has new decisions to make. As all-wise, God had full plans to meet events even before making the world. So in creating the world, God built into it 'trigger' mechanisms, which would bring about the responses God willed given the right events. Thus, God made his providential contribution all at once, without changing himself. God willed changing providential responses without having to change his will. God was spontaneous and creative, but expressed his creativity all at once rather than sequentially. Does this mean (oddly) that God answered our prayers before we prayed them? Not if God is also timeless; a timeless God's actions are not *earlier than* anything.

The Incarnation was an especially knotty problem for divine immutability's Christian friends. In general, these argued that all the change it involved occurred in the human nature which God the Son assumed rather than in God; God was eternally ready to be incarnate, and eternally had those experiences of the earthly Christ which the Incarnation makes part of God's life. Through changes in Mary and the infant she bore, what was eternally in God eventually took place on earth (see Incarnation and Christology §§1-2).

Power. Before the Ice Age, God could ensure that there would never be an Ice Age. God has this power now only if he can alter the past. Few think he can (see Omnipotence §§1, 3). So events seem to change God's power. (If they do, God also is passible; other things affect him. Further, if God once had and no longer has a power, God has a past, and so is in time.) Defenders of divine immutability reply that any change here is purely extrinsic. God has the intrinsic power he always has. He has lost a chance to use it, and so we no longer want to *call* his power a power to prevent an Ice Age. But God is intrinsically as able as ever to do so.

Omniscience. Tensed facts and truths are those we state in tensed sentences such as 'today is Christmas' or 'it is now noon'. An argument that divine immutability is incompatible with God's being omniscient and there being tensed facts and truths can be traced back at least to Islamic Mu'tazilite theologians and Ibn Sina. The argument is this: if God is omniscient, then he knows what time it is now. Now, at t, what God knows is that it is now t. Only at t can God know that it is now t, since only at t is this true. Later, at $t+1$, what God knows is that it is now $t+1$. God can know that it is now $t+1$ only at $t+1$. So the content of God's knowledge changes. So God changes (see Omniscience §2). In reply, some argue that:

(a) No truths are *irreducibly* tensed. Rather, 'it is now t' really reports (say) that 'at t, it is t'. The latter truth is tenseless. It is true at all times. So one can know it at all times, without change. If God knows tensed truth by knowing tenseless truths, he knows at each time what time it is, without changing.

(b) God can know in other ways the facts we express in irreducibly tensed truths. This is enough to qualify him as omniscient.
(c) What the tensed facts are depends on one's temporal standpoint. If so, then if God is not just immutable but timeless, his omniscience need encompass only tenseless facts plus whatever tensed truths there are in eternity. The latter do not change.

One may also wonder whether the nature of God's mind undercuts the argument. On some externalist theories of mental content, my knowledge that *P* is a complex consisting of my inner mental state plus certain items in the world. Those items are where and when they are, yet the knowledge is 'in my mind', and so (one presumes) where and when *I* am. If God is timeless and his mind's contents are as externalism suggests, his state of knowledge might be a complex consisting of his mental state plus temporal items; this knowledge might be 'where and when' God is - that is, timeless - and, as timeless, never change.

Impartiality

On the one hand, most of us feel that we are permitted, even required, to give special consideration to the interests of ourselves and our loved ones; on the other hand, we also recognize the appeal of a more detached perspective which demands equal consideration for the interests of all. Among writers in the utilitarian tradition, some insist that the strictly impartial perspective is the only one that is ethically tenable, while others argue that a measure of institutionalized partiality can be justified as a means to maximizing welfare. An alternative tradition, stemming from Kant, sees the demand for impartiality as deriving from the importance of fairness and equal respect for persons, but tends to leave open the degree of partiality permitted. Finally, the Aristotelian conception of ethics offers a justification of partiality based on the structure of those virtuous dispositions of character (such as those involved in friendship and self-esteem) which are required for developing our distinctively human potentialities.

1 The conflict between impartiality and partiality

Impartiality commands widespread approval. When an action is exposed as an instance of bias we disapprove precisely because the agent has allowed special ties to particular individuals or groups to affect what ought to have been a fair and impartial decision. Some philosophers, indeed, see impartiality as part of the essence of the moral outlook, believing that to adopt that outlook is, in Adam Smith's famous phrase (1759), to try to put oneself in the position of an 'impartial spectator' of mankind. Pulling in the opposite direction, however, are the special commitments that most human beings have towards their close friends and loved ones (see Family, ethics and the; Friendship; Love §2). For a parent to treat a child with no more than the impartial consideration owed to any human being seems cold and unloving. If morality is concerned with the good for humankind, then it must surely find a legitimate place for the development of those special, inherently partialistic relationships which are virtually inseparable from our human nature. A major task for moral philosophy is to examine, perhaps to try to resolve, the apparent conflict between those of our ethical intuitions which seem to demand an impartial stance, and those which apparently permit, or even require, a large measure of partiality.

The importance of impartiality in moral thinking is given force by the thought that although my own life may appear 'special' from my personal perspective, that specialness seems to evaporate from the wider perspective of humanity as a whole. In assessing the rightness of an action, by reference to its consequences for general welfare, Jeremy Bentham, as quoted by J.S. Mill (1861), insisted on the maxim 'everybody to count for one, nobody for more than one', which seems to rule out skewing the calculation in favour of particular individuals or groups. Hence if benefiting X produces a greater overall good than benefiting Y, it is right to benefit X; the fact that I have some special tie to Y (who could be, for example, my brother, or a member of my club, clan or race) ought presumably to make no difference. William Godwin (1793) devised a famous case to illustrate this: if two people (a philanthropic archbishop and a chambermaid) are trapped in a burning building, and I can rescue only one, then I should rescue the one who can do most good for mankind as a whole. Given that this is the archbishop, then it is he who should be rescued; I should resolutely set aside the fact that the chambermaid happens to be my mother, for 'what magic is in the pronoun "my" that should justify us in overturning the decisions of impartial truth?' ([1793] 1985: 170). Such resolute impartialism offers a potentially salutary challenge to many of our unreflective patterns of conduct, but, for its critics, it risks setting an unrealistic standard for action which few if any are capable of incorporating systematically into their daily lives.

2 Utilitarian approaches

Utilitarians have sometimes seemed quite prepared to embrace the austere consequences of the impartialist perspective (see Utilitarianism). Thus Peter Singer (1979) suggests that if I am dishing out food to hungry children, then I should make my own children wait in line; though favouring them might be psychologically understandable, from the ethical point of view it is suspect. There are two serious objections to any approach which yields this result. The first has the form of a 'slippery slope' argument. If all personal favouritism is ethically dubious, then we are apparently required to forego any good whatsoever for ourselves and our loved ones when an assignment of the relevant resources to others would produce greater global utility. Yet this implies not just (as most of us might on reflection accept) that I should give up luxuries when the money might be spent on famine relief, but that even the decisions to spend time and money on providing a home for my family, or on working at my own chosen

career, are ethically tainted. In short, the insistence on impartialism seems to entail the unbearably demanding result of uncompromising ethical ‘globalism’: as long as one surplus penny remains which could benefit those in greater need, nothing short of a life of near total self-sacrifice will stand up to ethical scrutiny (see Help and beneficence). Defenders of strict impartialism, such as Shelly Kagan (1989), would reply that the fact we feel uncomfortable with this result is no reason to reject the underlying theory, for who ever imagined that to act morally was supposed to be easy?

Here, however, a second objection comes to the fore. There seems a risk that what the impartialist apparently requires us to give up will include those very ties and commitments which make human life worth living, the personal projects (raising a family, developing long-term friendships, organizing a career) which are the very key to realizing our human potentialities. The point goes beyond the empirical observation that all these projects in fact require an enormous expenditure of time and energy on localized and individual (as opposed to general and global) welfare. For it appears, as Bernard Williams (1973) has argued persuasively, that our very individuality, our integrity as persons, depends largely on a self-oriented conception of ourselves (and by extension our loved ones) as special. Without that sense of specialness, and the partiality towards ourselves and those near to us which it implies, our very humanity is threatened: a being who lacked this orientation would be a mere worker bee in the utility hive, not a recognizable human being (see Morality and identity §4).

These observations pave the way for a response structured by an indirect (institutional or ‘rule’) version of utilitarianism. If human happiness indeed requires us to develop self-oriented projects and ties, then the way to maximize global utility will turn out to be not to require austerely impartial behaviour from all, but rather to allow humans to develop those institutions, practices and relationships which permit them to fulfil their human nature (see Utilitarianism §§3, 5). The argument will then run in a way analogous to that which led Adam Smith to suggest that the pursuit of individual self-interest is in fact the best way to secure general happiness. Given this framework, the utilitarian may well recommend that each of us devote time and attention to self-oriented projects, such as raising families and forming close personal relationships; but at a more general and abstract level, the justification for such social structures will still be a firmly consequentialist one, namely that the fostering of relevant institutions is the best way for global happiness to be secured. Such an approach has the advantage of providing a critical framework for trying to distinguish those types of partiality which are permissible from those which are not. Thus, public institutions which foster cronyism, nepotism and patterns of preference based on gender or race may be condemned as diminishing the prospects for the long-term maximization of global happiness, while family loyalties and ties of friendship may be seen as benign. A further advantage is to allow room for preserving intuitions about the appeal of impartiality as an ethical ideal; for the ‘benign’ nature of those institutions which are justified by this type of argument will hinge precisely on the fact that they are the kinds of institution which would be approved by an impartial and detached spectator of the global human predicament.

3 Impartiality, fairness and respect

A problem with trying to link the value of impartiality to the demands of welfare maximization is that it seems possible to imagine that global utility might be maximized by partialistic institutions of an (intuitively) objectionable kind. A master race might secure enormous benefits by preserving entrenched institutions according systematic preferential treatment to their own kind; and the resulting highly partialistic system might be one which would have to commend itself to an impartial spectator interested in global utility. This line of thought suggests the need for a conception of impartiality that goes beyond purely aggregative and utilitarian concerns. On one such conception, a truly impartial evaluator would require not just the best overall result, but one that would be recognized by all parties as acceptable, irrespective of their position in the social order. This is the thought behind John Rawls’ device of the ‘veil of ignorance’ (1971), designed to secure fairness by ensuring that social institutions are ones we could in principle approve of even if we had to change places with the least advantaged of our fellow citizens (see Rawls, J. §1). It is not, however, clear that the application of these conditions yields one uniquely ‘rational’ choice. Just as two equally impartial judges might favour, respectively, stern retribution and maximum leniency, so one impartial deliberator might prescribe highly competitive social institutions which allowed the weak to go to the wall, while another might favour heavy taxation to fund lavish welfare benefits. Pure impartiality, in short, appears to be merely a ‘meta-requirement’, demanding consistency in the application of rules to all concerned, but not providing clear decisions about the ethical credentials of various possible social institutions.

The approach of Rawls owes much to the tradition in ethics started by Kant (1785), which, with its stress on respect for persons, would prohibit any action or institution which treats individuals merely as a means to an end (see Kantian ethics; Respect for persons). Although this ‘categorical imperative’ is silent on the ethical status of personal ties and commitments, it suggests room for a compromise between partialistic ethics and impersonal duty: love and other partialistic emotions and patterns of conduct are permitted, so long as they do not violate (impartially defined) Kantian rules of justice and respect for others. But while such a compromise might operate satisfactorily in an economy of abundance, the preferential assignments demanded by the partialist will, in an economy of scarcity, inevitably raise questions about our ethical obligations to relieve suffering elsewhere. In devoting resources to myself and my loved ones, perhaps I may not formally be violating Kantian rules against treating others without respect, but I am certainly reserving for myself goods which might be used to enable others to reach the level of dignity and self-respect which I take for granted in pursuing my own partialistic concerns and projects. The conflict between the autocentric perspective of the partialist and the more universal stance of both deontological and consequentialist ethics seems inescapable (see Deontological ethics).

4 The perspective of virtue ethics

The tradition of so-called ‘virtue ethics’ approaches these questions from a rather different standpoint (see Virtue ethics). For Aristotle, the dispositions of character to be fostered are those which develop our potentiality for human fulfilment, and though impartial virtues such as justice figure importantly in the resulting blueprint for the good life, many of the other virtues, most notably those connected with love and friendship, seem inherently partialistic, involving special commitments to those to whom I am bound by close personal ties (*Nicomachean Ethics*) (see Aristotle §§25-6; Virtues and vices). Aristotle draws several interesting comparisons between my attitude to my friends and my attitude to myself, and it is striking that he allows a perfectly legitimate ethical space for self-love, or self-esteem. Aristotelian virtue thus allows me, in the assignment of goods, to give special preference to a particular individual, myself. Several twentieth-century philosophers have laid great stress on universalizability as a test for morality, holding that there is no place in ethics for principles which contain an ineliminable reference to particular individuals (see Universalism in ethics). It seems, though, that there is nothing to stop the advocate of Aristotelian-style partialism allowing that every human being is entitled to accord special preference to themselves and their loved ones, so that there is a sense in which the ethics of partiality do, after all, pass the test of universalizability. The difficulty remains, however, that the assignment of time and resources necessary to develop a rich and fulfilling life for myself and my close friends will inevitably mean that less remains for those outside the charmed partialistic circle; Aristotle himself was largely unbothered by slavery. That said, it remains an attractive feature of the Aristotelian approach that it allows due ethical value to those deep personal concerns and emotional commitments that appear to be crucial ingredients in any plausible recipe for a good human life. Ethical excellence, is, Aristotle insisted, concerned with feelings as well as actions; a significant part of our fulfilment lies in the cultivation of harmonious and enriching habits of feeling (see Morality and emotions §3). Since so much that is of value in our emotional life seems to have an ineradicable dimension of particularity and partiality, any system of morality which fails to allow scope for that dimension risks being seriously defective.

Imperative logic

Imperatives lie at the heart of both practical and moral reasoning, yet they have been overshadowed by propositions and relegated by many philosophers to the status of exclamations. One reason for this is that a sentence's having literal meaning seems to require its having truth-conditions and 'Keep your promises!' appears to lack such conditions, just as 'Ouch!' does. One reductionist attempt to develop a logic of imperatives translates them into declaratives and construes inferential relations among the former in terms of inferential relations among the latter. Since no such reduction seems fully to capture the meaning of imperatives, others have expanded our notion of inference to include not just truth - but also satisfaction - preservation, according to which an imperative is satisfied just in case what it enjoins is brought about.

A logic capturing what is distinctive about imperatives may shed light on the question whether an 'ought' is derivable from an 'is'; and may elucidate the claim that morality is, or comprises, a system of hypothetical imperatives. Furthermore, instructions, which are often formulated as imperatives ('Take two tablets on an empty stomach!'), are crucial to the construction of plans of action. A proper understanding of imperatives and their inferential properties may thus also illuminate practical reasoning.

1 Jörgensen's dilemma and Ross's 'paradox'

Any attempt to codify the logical properties of imperatives must grapple with the following dilemma, first formulated by Jörgensen (1938). On the one hand there appear to be cogent inferences involving imperatives, as in:

Keep your promises!
This is a promise of yours.
Keep this promise!

On the other hand, the only widely agreed-upon conception of good inference is in terms of truth-preservation: a set of sentences Γ implies a sentence ϕ just in case there is no possible situation in which all members of Γ are true and ϕ is false. Yet evidently this conception of cogency in terms of truth-preservation cannot be used to assess the validity of arguments utilizing imperatives, for imperatives are not, *prima facie*, either true or false. Hence either we deny, implausibly, that there are good inferences involving imperatives; or we grant it and then face the question, to what conception of inference are we appealing?

This challenge is to be distinguished from another, less urgent concern first formulated by Ross (1944) and echoed by Williams (1963). According to the classical logic of truth functions, any proposition *P* implies $P \vee Q$, for any *Q*. Similarly, it would seem that even the most conservative imperative logic would countenance the inference

Post this letter!
Post this letter or burn it!

Demanding that the auditor either post the letter or burn it may be seen as granting permission to do either. But then if anyone committed to the premise is thereby committed to the conclusion above, it may seem that demanding that the auditor post the letter is implicitly granting permission to burn it. This reasoning vacillates on the concept of commitment. We may distinguish between commitment to the content of a sentence and commitment to performing the speech act of uttering that sentence with its characteristic illocutionary force. One who utters the premise of the above inference is not thereby committed to performing the speech act of demanding that the auditor either post the letter or burn it, just as one who asserts *P* is not thereby committed to asserting $P \vee Q$. (Asserting *P* merely commits one to the truth of $P \vee Q$.) Yet it is only the performance of the speech act of uttering an imperative that grants permission to the auditor to satisfy that sentence by satisfying any disjunct that it contains: commitment merely to the content of that sentence does not suffice to grant permission of any kind.

To others a logic of imperatives may seem trivially simple. It is common to distinguish between two elements in an imperative sentence, one of which is shared with indicative sentences and the other not: from both 'Shut the door!' and 'The door is shut' we can abstract a reference to the state of affairs of the door's being shut. The former

sentence enjoins that state of affairs while the latter asserts that it obtains. Following Stenius (1967), let us say that what is common to the two sentences is the ‘sentence-radical’, while what distinguishes them is their ‘modal element’. One might urge that the validity of arguments involving imperatives should be understood just in terms of sentence-radicals, since these require no modification in our ‘truth-preservation’ conception of validity. But this leaves us with no account of when and where modal elements can occur in valid arguments. It is unclear, for instance, how without *ad hoc* postulation we are to avoid countenancing:

Shut the door!
The door is shut.

Approaches to the logic of imperatives may be seen as grappling with one or other horn of Jörgensen’s dilemma.

2 Reductionist approaches

Reductionist approaches attempt to show that there is no good inference that crucially involves imperatives; at best, any inference that seems to involve imperatives can be replaced with an equivalent one comprising only indicatives, to which the truth-preservation conception of validity applies. To the objection that only propositions appear to be truth-bearers, reductionists might reply that the difference in grammatical mood between imperatives and declaratives is an idiosyncrasy of idiom; a mere reflection of the fact that these two types of sentence are typically used to perform different kinds of speech acts. The difference of mood need be of no more interest to the logician than is the difference between the active and passive voice in declarative propositions.

So with what propositions are imperatives to be identified? On one proposal, ‘Shut the door!’ is equivalent to ‘You will shut the door’. This equation is perhaps suggested by the fact that the latter type of sentence is often used to convey a command; if correct then imperative inference may be understood in terms of inferential relations among statements in the future tense (see Tense and temporal logic). Yet this identification falls foul of our ability to make predictions without formulating any kind of directive: a parole officer might say to a repeat offender, ‘You will steal again’, without enjoining him to crime. Others have contended that ‘Shut the door!’ is equivalent to ‘I want you to shut the door’; here imperative inference is a direct consequence of the logical properties of attitude locutions (see Propositional attitude statements §§1-2). But one can, and may have to, command something one does not want. Furthermore, recipes and instructions are often formulated with imperatives but appear not to be reports of anybody’s desires.

It has also been proposed that ‘Shut the door!’ is equivalent to ‘Either you are going to shut the door, or *X* will happen’, where *X* is something bad for the person being addressed. Yet a speaker might reasonably utter an imperative such as ‘Keep your promises!’ knowing full well that no harm will come the auditor if they fail to obey. Second, the theory implies that for any action *Y*, either ‘Do *Y*!’ or ‘Don’t do *Y*!’ is true. A distinct, ‘performative’ analysis of the imperative has it that ‘Shut the door!’ is equivalent to ‘I order you to shut the door’ (see Performatives). This proposal requires an imperative to be as multiply ambiguous as there are distinct illocutionary acts that can be performed with that sentence; on a given occasion of utterance the same sentence might mean, ‘I request that you shut the door’. This theory is thus committed to a multiplication of senses for what seem to be univocal sentences.

The most popular reduction may be traced to Kant (1785) and equates ‘Shut the door!’ with the ‘deontic’ proposition ‘You should (or ought to) shut the door’. On this approach imperative inference is a matter of inferential relations among deontic locutions (see Deontic logic). We may distinguish between two species of imperative - fiats and directives - only the latter of which are directed to a particular person or group of persons. Clearly, directives are the much more common form and for these it would seem that being directed to a particular individual is part of their content. This is perhaps why imperatives are so naturally issued with vocatives, as in ‘Mary, make sure John does his homework’. In contrast to an imperative, the truth of a deontic proposition does not, as such, lay obligations upon any one person rather than another. ‘It is obligatory that *A*’ does not discriminate among the various people who might be obliged to make it the case that *A*. This even holds for ‘John should see to it that *A*’: a speaker might want to lay responsibility on Mary for making John see to it that *A*, but will not be able to do so with just deontic propositions. A deontic reduction lacks the resources to capture the directedness of imperatives.

3 Non-reductionist approaches

Grappling with the other horn of Jörgensen's dilemma involves formulating a notion of inference to include things other than truth-bearers. Since validity as here characterized is a semantic notion, an account of valid reasoning with imperatives would require assigning semantic values to imperative sentences. One proposal stems from Lemmon (1965), according to whom the basic semantic value of an imperative is to be that of its being 'in force' (or not). Thus when a commanding officer says, 'Clean the latrine!' to a soldier, the command is typically in force, whereas if the soldier were to say the same to the commanding officer this would typically not be the case. This suggests the following criterion of validity:

An argument is valid if and only if, given that all the directive premises are in force and all the declarative premises are true, then the conclusion is in force if it is a directive and true if it is a declarative.

This definition of validity sheds no light on the question whether, for instance, the being in force of 'Take all the boxes!' implies the being in force of 'Take this thing!' when the speaker is unaware that this thing is one of the boxes. Lemmon's proposal is thus a mere schema for a definition. A more explicit proposal flows from the work of Hofstadter and McKinsey (1939), Rescher (1966) and Sosa (1967). Say that an imperative is 'satisfied' just in case its sentence-radical (see above) is true. One might suggest that an argument is valid if and only if, whenever its imperative premises are satisfied and its indicative premises are true, then its conclusion is satisfied if imperative and true if indicative. This definition would explain the apparent validity of the inference with which §1 of this entry began. On the other hand, it countenances the inference from 'Shut the door!' to 'The door is shut'.

Sosa attempts a definition in terms of satisfaction-preservation for arguments consisting only of imperatives, some of which may be hypothetical in form. Let us say that imperatives such as 'If it rains, close the window!' are 'satisfied' if it rains and the window is closed; 'violated' if it rains and the window is not closed; and 'neutral' if it does not rain. (All imperatives can be construed as hypothetical if we imagine $P \vee \sim P$ as antecedent when none is otherwise specified.) We now say:

A directive argument is valid just in case (1) if its premises are satisfied then the conclusion is satisfied and (2) if the conclusion is violated then at least one of its premises is violated.

This definition can account for the validity of

If you read this book, come to see me!
Read this book!
Come to see me!

On the other hand, the definition renders invalid the apparently correct

If it rains, close the window!
If it rains and thunders, close the window!

A cognate definition given by Rescher founders on its inability to treat the relation 'is validly inferable from' as being transitive.

There is today no accepted account of imperative inference. Instead research focuses upon the semantics of imperatives while stopping short of formulating a calculus. Yet if these semantic questions can be answered it may be hoped that new proposals for understanding imperative inference may grow in the light the answers shed. Until that time reductionist approaches will continue to be attractive.

Implicature

A term used in philosophy, logic and linguistics (especially pragmatics) to denote the act of meaning or implying something by saying something else. A girl who says 'I have to study' in response to 'Can you go to the movies?' has implicated *(the technical verb for making an implicature) that she cannot go. Implicatures may depend on the conversational context, as in this example, or on conventions, as when a speaker says 'He was clever but poor', thereby implying - thanks to the conventional usage of the word 'but' - that poverty is unexpected given intelligence. Implicature gained importance through the work of H.P. Grice. Grice proposed that conversational implicatures depend on a general principle of rational cooperation stating that people normally try to further the accepted purpose of the conversation by conveying what is true, informative, relevant and perspicuous. The extent and nature of the dependence, and the precise maxims involved, are matters of controversy. Other issues include whether certain implications are implicatures rather than presuppositions or parts of the senses (literal meanings) of the words used.*

1 Speaker meaning and implication

H.P. Grice (1989: chaps 5, 6 and 14) drew an important distinction between what a speaker means or implies, and what a sentence or other expression means or implies. The sentence 'The aeroplane is a mile long' means that the aeroplane is 5,280 feet long, and implies that it is over 3,279 feet long. Nevertheless, it would be most unlikely for a speaker uttering the sentence to mean or imply such things unless he were joking. More likely, the speaker would be exaggerating, meaning simply that the plane is enormous compared with typical planes. A speaker using the sentence in a coded message might mean something completely unrelated to its English meaning.

As a first approximation, word meaning may be characterized as *conventional* speaker meaning. Whereas we could conceivably use 'bachelor' to mean just about anything, we conventionally mean 'unmarried male', which is what the word means. Speaker meaning is determined by the intentions of the individual speaker (see Communication and intention). While the exact intentions required are a matter of controversy, it is plausible that a speaker *S* means that the plane is enormous only if *S* used the sentence to express the belief that the plane is enormous. Typically, *S* would intend to produce that belief in the audience. Speaker implication is *indirect* speaker meaning: meaning one thing (for example, that one cannot go out) by meaning another (that one has to study).

2 Speaker implicature

Grice was the first to systematically study cases in which speaker meaning differs from sentence meaning. He introduced the verb 'implicate' and the cognate noun 'implicature' as technical terms denoting 'the act of meaning or implying something by saying something else' (Grice 1989: chaps 2 and 3). Consider the following dialogue:

(1) Ann: Where can I get petrol?
Bob: There's a petrol station around the corner.

We may suppose Bob to have implied that Ann can get petrol at the petrol station. Nevertheless, Bob did not actually say that Ann can get petrol there. So Bob has 'implicated' it. What Bob said, and therefore did not implicate, is just that there is a petrol station around the corner. By 'saying', Grice meant not mere uttering, but saying *that* something is the case. (As Grice realized, 'say' can be used more or less narrowly. The less speakers are counted as saying, the more they are counted as implicating.)

Example (1) shows that saying is more closely related to conventional meaning than to speaker meaning. The implication that Ann can get petrol at the petrol station is no part of the meaning of 'There's a petrol station around the corner'. If '*e*' means that *p* on a given occasion, then the speaker says that *p*. The converse fails for several reasons. First, a speaker who utters 'Jack and Jill went up the hill' has said that Jack went up the hill; but that is only part of what the sentence means. Second, a speaker who utters 'He is liberal' might have said that President Clinton is liberal; but (being indexical) 'He is liberal' does not mean 'President Clinton is liberal', even on that occasion (see Demonstratives and indexicals). In general, though, an implicature may be described as something the speaker means or implies that is not part of what the sentence literally means.

If '*e*' means that *p*, or if *S* says that *p* by uttering '*e*', then '*p*' is a truth-condition of '*e*', either in general, or as

used on that occasion. Truth-conditions are logical or a priori implications. Assuming particular interpretations, ‘*p*’ is a truth-condition of sentence ‘*e*’ if and only if it is absolutely impossible for ‘*e*’ to be true without ‘*p*’ being true. ‘There is a petrol station’ is a truth-condition of ‘There’s a petrol station around the corner’. For the latter cannot be true unless the former is true. But ‘Ann can get petrol at the petrol station’ is not a truth-condition of ‘There’s a petrol station around the corner’. The petrol station might be out of petrol or closed. It follows that an implicature need not be a truth-condition of the sentence uttered. The two notions are not mutually exclusive, however, as the following dialogue between an auditor and tax payer illustrates.

(2) Alan: Is it true that you or your spouse is 65 or older or blind?
Bill: I am 67.

By saying ‘I am 67’, Bill implicated (he implied but did not say) that he or his spouse is 65 or older or blind. Furthermore, he could not be 67 unless he or his spouse were 65 or older or blind. So *S*’s implicature is also a truth-condition of the sentence *S* uttered on that occasion.

Empirically necessary conditions, let us say, are ‘natural’ implications. ‘The power is on’ is a natural implication of ‘The lights are on’. If ‘*e*’ naturally implies ‘*p*’, then ‘*e*’ means that *p* in Grice’s natural sense. Whether natural implications are implicatures depends on the speaker’s intentions. In dialogue (3), we would expect Beth to have implicated that the power is on.

(3) Alice: Is the power on?
Beth: The lights are on.

But if Beth does not know what power is, and gives that answer out of desperation, then she would not have implicated that the power is on.

Speakers who know that an implicature is false have misled their audience. But they have not lied unless the implicature happens to be a truth-condition. If Bob knows there is no petrol at the petrol station, then he has misled Ann in dialogue (1). But Bob has not lied, since he did not actually say that there was petrol there. However, if Bill knows that what he has implicated is false in dialogue (2), then he has to be lying.

3 Utterance and sentence implicature

An utterance implicates whatever the utterer implicates. Thus in (1), Bob’s utterance implicated that Ann can get petrol. A sentence implicates, roughly, what speakers following linguistic conventions would normally use it to implicate. Despite what Bob implicated in (1), the sentence Bob used does not itself implicate ‘Ann can get petrol at the petrol station’. For in most contexts, there would be no impropriety in using ‘There’s a petrol station around the corner’ without that implicature. In contrast, (4a) itself implicates (4b):

(4a) Bill is sick, so he should rest.
(4b) Bill’s being sick implies that he should rest.

For a speaker could not properly use (4a) without implicating (4b). And (5a) implicates (5b):

(5a) Some died.
(5b) Not all died.

For speakers would normally use (5a) with that implicature.

4 Conventional versus conversational implicature

Implicatures generated by the conventional meaning of the words uttered, as in (4), are classified as ‘conventional’ (see, for example, Grice 1989: 25-6). Non-conventional implicatures, as in (5), are termed ‘conversational’, since they depend on the conversational context. Normally, if one uses a sentence aware of the falsity of some of its conventional implicatures or logical implications, one uses the sentence improperly. If one uses a sentence aware of the falsity of a conversational implicature, one’s utterance is at most misleading. Conversational implicatures differ further in being cancellable. The implicature of (5a) can be explicitly cancelled by adding ‘indeed, all did’. ‘some died, indeed all did’ is perfectly consistent, and does not imply ‘Not all died’ in

any way. In contrast, since ‘All died’ logically implies ‘some died’, ‘All died, indeed none did’ is self-contradictory. ‘Bill is sick, so he should rest, but Bill’s being sick in no way implies that he should rest’ is incoherent in a different way. Conventional implicatures can also be implicitly cancelled by the context. Thus (5a) would not have its customary implication if uttered in full view of a garden in which every single plant was obviously dead. Conversely, conversational implicatures are reinforceable. Conjoining a sentence with one of its conversational implicatures is not redundant, and logically implies what the original sentence implicates; witness ‘some died, but not all did’; in contrast, ‘All died, and some did’ is redundant.

5 Conversational maxims and the cooperative principle

Besides identifying the phenomenon of implicature, Grice formulated a theory in terms of which he classified different sorts of conversational implicature, and tried to explain how they arise and are understood. It is common knowledge, he asserted, that people generally follow certain rules for efficient communication. Grice’s rules (1989: 26-9) included one general ‘principle of cooperation’, and four ‘maxims’ specifying how to be cooperative:

The cooperative principle. Contribute what is required by the accepted purpose of the conversation.
The maxim of quality. Make your contribution true, so do not convey what you believe false or unjustified.
The maxim of quantity. Be as informative as required, neither more nor less so.
The maxim of relevance. Be relevant.
The maxim of manner. Be perspicuous, so avoid obscurity and ambiguity, and be brief and orderly.

Generalizations of these rules govern rational, cooperative behaviour in general. If I am helping a man change the oil, I will hand him a can of oil rather than a jack (relevance), a barrel of oil (quantity), or fake oil (quality), and I will not take all day doing it (manner). The maxims do not, therefore, have the characteristic arbitrariness of linguistic conventions. Much of the literature is devoted to clarifying and strengthening the maxims, relating them, and extending the list. But Grice’s formulations are still dominant.

To sketch how the principles are thought to explain the way implicatures arise and are understood, consider (1). Bob would have infringed the maxim of relevance unless he believed Ann could get petrol at the petrol station. Since Bob was trying to cooperate, his utterance indicated that belief. Thus Bob could imply that Ann can get petrol there and expect Ann to recognize that implication. Speakers using (5a) would violate the maxim of quantity if they knew that all died. So by not making the stronger statement, they can imply that not all died, and expect hearers to recognize the implication. Unlike conventional implicatures, conversational implicatures are cancelled when the maxims are in abeyance. Under cross-examination of an uncooperative witness, (5a) would not implicate (5b).

Some implicatures depend on flouting the maxims, Grice proposed (1989: 30-1). This occurs when what a cooperative speaker says so obviously fails to obey the maxims that the hearer must assume the speaker to be meaning something different. Irony and metaphor appear to depend on flouting the maxim of quality. Hearing ‘Fine day, isn’t it?’ in the middle of a blizzard, we would recognize that the speaker cannot really believe it to be a fine day, and means the opposite. Hearing ‘The music danced lightly on his ears’, we would recognize that the speaker believes no such thing, and is using metaphor. The speaker who says ‘The singer produced a series of sounds closely corresponding to the score of *Oklahoma*’, thereby meaning that the singing was terrible, is flouting the maxim of manner.

Many of Grice’s theoretical claims about the exact role played by the maxims in implicature are implausible. For example, Grice suggested that *S* conversationally implicates ‘*p*’ only if: (i) *S* is presumed to be observing the cooperative principle (‘cooperative presumption’); (ii) the supposition that *S* believes ‘*p*’ is *required* to make *S*’s utterance consistent with the cooperative principle (‘determinacy’); and (iii) *S* believes or knows, and expects the hearer *H* to believe, that *S* believes *H* is able to determine that (ii) is true (‘mutual knowledge’). The cooperative presumption would fail if, as is possible, Beth implied what she did in case (3) in defiance of Alice’s mistrust, or if Beth implicated that she cannot answer the question by saying ‘I’m late for an appointment’.

Determinacy fails outright in case (1), as presumably does mutual knowledge: the assumption that Bob believed Ann could at least learn where to get petrol would also reconcile his utterance with the maxims, as would the more fantastic assumption that Bob believed the petrol station was giving away new diesel Volvos. Indeterminacy is of

legendary proportions in figures of speech. Mutual knowledge may even fail independently. In (3), for example, Beth may have contemptuously implied that the power is on, believing that Alice would not be smart enough to figure it out. Some authors have nevertheless strengthened the mutual knowledge condition to say that *S* knows that *H* knows that *S* knows that *H* knows *ad infinitum*, a requirement both psychologically unrealistic and theoretically unnecessary.

While the maxims undeniably provide insight into conversational implicature, their predictive and explanatory power is extremely limited. Consider the account of irony. Grice suggests that *S* implicates 'It is a lousy day' when saying 'Fine day, isn't it?' because otherwise *S* would be violating the maxim of quality and thereby the cooperative principle. But *S* is still violating that principle, by violating the maxim of manner: figures of speech are seldom the most perspicuous ways of communicating information. Consider quantity implicatures. If (5a) implicates (5b) because of the maxim of quantity, then why does (5a) not implicate 'It is not the case that two per cent died'? Why does 'The repairs will take some time' not implicate 'They will not take a long time'? Why does 'Ann said Bill was responsible' not implicate 'Ann did not insist (or predict, or argue, or shout, or…) that Bill was responsible'? Consider finally the sequential interpretation of conjunctions. Grice explained why a conjunction like (6a) implies (6b) in terms of the submaxim 'Be orderly'.

(6a) Bill fell ill and saw the doctor.
(6b) Bill fell ill and therefore saw the doctor.
(6c) Bill saw the doctor and therefore fell ill.
(6d) It is more likely that Bill fell ill than that he saw the doctor.
(6e) Bill did not see the doctor because he fell ill.

But reverse temporal or causal order is just as orderly as forward order (witness 'Bill died; he had cancer'). So why should (6a) not imply (6c)? It would also be quite orderly to express the conjuncts from most to least probable. So why is (6d) not implied? And since '*B* because *A*' is stronger than '*A* and *B*', why is (6e) not implied in virtue of the quantity maxim? (For a comprehensive critique of Gricean theory, see Davis 1998.)

6 Theoretical importance

Difficulties in Gricean theory do not cast doubt on the existence or theoretical importance of implicature. Speakers cannot be fully understood without knowing what they implicate. It does not suffice to know the truth-conditions (or in some cases even the meaning) of all the sentences uttered, or what is said. Implicature must be considered even in truth-conditional semantics. Here are two examples.

Ambiguity. Readily available evidence suggests that the word 'and' is ambiguous in English, having a strong sense (literal meaning) connoting temporal or causal order in addition to the weak sense connoting joint truth alone. But before this can be accepted, the competing hypothesis that the sequential connotation is merely an implicature must be rejected (see Ambiguity §3). Many facts support implicature over ambiguity. For example, 'Bill fell ill and saw a doctor, but not necessarily in that order' does not have a contradictory reading. Furthermore, 'It is not the case that Bill fell ill and saw a doctor' would be interpreted as false when 'Bill fell ill' and 'Bill saw a doctor' are both true, no matter what the sequence of events.

Grice (1989: 47-50) proposed a version of 'Ockham's razor' according to which 'senses are not to be multiplied beyond necessity'. But the same can be said for implicatures. It is often claimed that since implicatures can be accounted for in terms of general psycho-social principles of conversation, the postulation of senses rather than implicatures results in a more complex overall theory. But this overstates the explanatory powers of any known principles of conversation.

Presupposition. '*e*' is said to (semantically) 'presuppose' '*p*' provided the truth of '*p*' is necessary for '*e*' to be either true or false (see Presupposition). Following P.F. Strawson, and opposing Bertrand Russell, many have argued that a sentence like (7a) presupposes (7b):

(7a) Your crimes are inexcusable.
(7b) You have committed crimes.
(7c) Your crimes are not inexcusable.

The presupposition hypothesis is plausible since (7c) seems to imply (7b) just as strongly as (7a) does. Accepting presuppositions seriously complicates logical theory, however. For example, if some declarative sentences are neither true nor false, then standard formulations of the 'law of excluded middle' must be modified. One strategy for avoiding these complications hypothesizes that the implication of the negation is merely a conventional implicature (see, for example, Karttunen and Peters 1979). On this view, (7c) conventionally implicates (7b) without logically implying it. The fact that a sentence may be true when an implicature is false allows the Russellian to account for the felt implications, while insisting that (7c) is true and (7a) false when (7b) is false. Supporting Strawson, though, is the strong intuition that 'Are your crimes excusable or not?' is a loaded question, which cannot be answered if you are innocent. An outstanding problem for either approach is to describe how implications of complex propositions (whether presuppositions or implicatures) are related to those of their components.

Implicature has also been invoked in accounts of lexical gaps, language change, indirect speech acts, textual coherence, discourse analysis and even syntax.

Incarnation and Christology

It is a central and essential dogma of Christianity that Jesus of Nazareth, who was crucified in Judea during the procuratorship (AD 26-36) of Pontius Pilate, and God, the eternal and omnipresent creator of the universe, were in some very strong sense 'one'. The department of Christian theology that is devoted to the study of the nature and implications of this 'oneness' is called Christology. Orthodox Christology (unlike certain heretical Christologies) sees this oneness as a oneness of person, as consisting in the co-presence of two natures, the divine and the human, in one person, Jesus Christ. To speak plainly, orthodox Christology holds that there is someone, Jesus Christ, who is both divine and human. Because God pre-existed and is superior to every human being, orthodox theologians have found it natural to speak of the union of the divine and human natures in the person of Jesus Christ as something that happened to *the pre-existent divine nature: at a certain point in time, at the moment of the conception of Jesus, it 'took on flesh' or 'became incarnate'; in the words of the Athanasian Creed, the union of the two natures was accomplished 'not by conversion of the Godhead [*divinitas*] into flesh, but by taking of the manhood into God'. This event, and the continuing union it established, are called 'the Incarnation'. The Incarnation was not, according to Christian teaching, undone by Christ's death (his corpse - a* human *corpse - continued to be united with the divine nature by the same bond by which the living man had been united) or by his 'Ascension' (his 'withdrawal' from the everyday world of space and time forty days after the Resurrection), and it will never be undone: the Incarnation is eternal.*

The primary statements of the dogma of the Incarnation are the Definition issued by the Council of Chalcedon (AD 451) and the Athanasian Creed (fifth century; its origins are obscure). The creed issued by the Council of Nicaea (AD 325) and the longer, revised version of this creed that is today used liturgically (and commonly called 'the Nicene Creed') contain nothing of substance that is not found in the two later statements.

1 The doctrine of the Incarnation

Books present portraits, generally inadvertent, of their authors and their intended audiences. The New Testament presents a portrait of Christians who were not quite sure what to say about the relation between Jesus Christ and God. On the one hand, the earliest Christians could hardly deny that Christ was a man (had he not frequently referred to himself as 'the Son of Man'?), a human being who had been born and had died (albeit he was not dead for very long), who ate and drank and spoke and slept and left prints in the dust of Palestine. On the other hand, they could hardly speak of Christ without mentioning God in the same breath, they called him 'the Son of God', and they were unreflectively willing to ascribe to him honours held traditionally in their cultures to be due to God alone. Explicit statements about the relation between Christ and God are rare in the New Testament. There are, however, a few passages in which this relation is described, and all of these imply, or come very close to implying, a 'high' Christology - a Christology that in some sense identifies Christ with God. Thus (the translations are those of the New American Standard Bible):

> In the beginning was the Word [*logos*], and the Word was with God, and the Word was God. He was in the beginning with God. All things came into being by him, and apart from him nothing came into being that has come into being…. And the Word became flesh and dwelt among us, and we beheld his glory…
>
> (John 1: 1-3, 14)

> He [Christ] is the image of the invisible God, the first-born of all creation [that is, has an authority over the created world comparable to that which, under Jewish law, a first-born son had over his living father's estate]. For by him all things were created, both in the heavens and on earth, visible and invisible,…- all things have been created by him and for him. And he is before all things and in him all things hold together [*sunistemi*]…. For in him all the fullness of Deity dwells in bodily form.
>
> (Colossians 1: 15-17; 2: 9)

> In these last days, [God] has spoken to us in his Son, whom he appointed heir of all things, through whom also he made the world [literally: 'made the ages']. And he is the radiance of his [God's] glory, and the exact representation of his nature, and upholds all things by the word of his power.
>
> (Hebrews 1: 2, 3)

It should also be noted that in John 8: 58, and possibly in John 10: 22-38, the author represents Jesus as affirming his own deity, and that in John 20: 28, the apostle Thomas addresses the risen Jesus as ‘My Lord and my God’.

The New Testament, although it is rich in Christological suggestion, contains no systematic Christology. The development of a systematic Christology was the work of the first five Christian centuries. The relevant biblical passages - those quoted above, and a few others, such as Philippians 2: 5-11 - have been treated by most theologians not as explicit statements of doctrine but as data to which explicit statements of doctrine must be responsible. The ‘developed’ doctrine, the doctrine of the fifth century, is contained in the following two passages.

> …we all unanimously teach that we should confess that our Lord Jesus Christ is one and the same Son, the same perfect in Godhead and the same perfect in manhood, truly God and truly man, the same of a rational soul and body, consubstantial with the Father in Godhead, and the same consubstantial with us in manhood, like us in all things except sin; begotten from the Father before the ages as regards his Godhead, and in the last days, the same, because of us and because of our salvation begotten from the Virgin Mary, the *Theotokos* [God-bearer], as regards his manhood; one and the same Christ, Son, Lord, only-begotten, made known in two natures without confusion, without change, without division, without separation, the difference of the natures being by no means removed because of the union, but the property of each nature being preserved and coalescing in one *prosopon* [person] and one *hypostasis* [subsistence], not parted or divided into two *prosopa*, but one and the same Son, only-begotten, divine Word, the Lord Jesus Christ, as the prophets of old and Jesus Christ himself have taught us about him and the creed of our fathers has handed down.
>
> (Definition of Chalcedon; see Kelly 1960)

> …[N]ow the right faith is that we should believe and confess that our Lord Jesus Christ, the Son of God, is equally both God and man.
>
> He is God from the Father’s substance, begotten before time; and he is man from his mother’s substance, born in time. Perfect God, perfect man composed of a rational soul and human flesh, equal to the Father in respect of his divinity, less than the Father in respect of his humanity.
>
> Who, although he is God and man, is nevertheless not two but one Christ. He is one, however, not by the transformation of his divinity into flesh, but by the taking up of his humanity into God; one certainly not by confusion of substance but by oneness of person. For just as rational soul and flesh are a single man, so God and man are a single Christ.
>
> (Athanasian Creed; see Kelly 1964)

These passages seem to say, and rather insistently, that there is a single *prosopon* or *hypostasis* or *persona*, Jesus Christ, who both has a beginning in time and has no beginning in time. More generally, he has all of the properties - attributes, features or characteristics - appropriate to a (sinless) human being, and at the same time has all of the properties that the Christian faith ascribes to God.

In order to grasp the orthodox doctrine expressed in these statements, it is advisable to have some conception of unorthodoxy, of the great Christological heresies of the first five Christian centuries, for these heresies were present in the minds of the framers of the statements and are to a large extent responsible for the details of the wording. The most important heresies for this purpose are the following three.

Nestorianism denies that the two natures belong to the same person: according to Nestorianism - if not to the eponymous Nestorius (d. *circa* 451), who may not actually have held this - the divine Christ and the human Christ are numerically distinct persons. That is, however intimate the union - or ‘conjunction’ (*sunápheia*), the word preferred by the Nestorians - of the human and the divine Christs, there is no one who can say truly both ‘I am God’ and ‘I am a human being’. According to Nestorians, the ‘conjunction’ of the divine and the human natures was effected between God and a pre-existent human being. Since God and Jesus each existed before the conjunction, and each was then who he was, there could not have been only one person ‘present’ after the conjunction unless the human person had somehow ceased to be - which is obviously unacceptable. (Orthodox Christology holds that the human being Jesus of Nazareth did not exist before the Incarnation, and that, in modern terminology, there is no possible world in which he exists, even for the briefest instant, without God’s being incarnate in him.)

Monophysitism ('one-naturism') holds that there is only one nature, the divine nature, in the incarnate Christ. The human attributes of Jesus of Nazareth are somehow taken up into or made to be contained within the divine nature; at any rate, they do not constitute a distinct, subsistent human nature - that is, a human being. (It should be noted that early Christological writings do not always make it clear whether 'a nature' (*physis*, *natura*) is a 'predicable', like the *attributes* divinity and humanity, or a 'first substance', an impredicable subject of predication, like God and Jesus of Nazareth. Some authors write as if the distinction did not exist or was of no importance; others seem perversely to take their opponents to mean one of these things when they should pretty clearly be taken to mean the other.)

Apollinarianism (after Apollinarius (*c*.310-*c*.390)) holds that Christ did not have a human mind or spirit or rational soul - that he lacked something that is essential to human nature - and that God or some 'aspect' of God (such as the divine *logos*) was united to the human body of Jesus of Nazareth in such a way as to 'be a substitute for' or perform the function of the human mind or soul or spirit. This is perhaps the most important of the heresies for the task of understanding orthodoxy: it is certainly very frequently suggested by the language of popular Christianity. Orthodoxy insists, however, that whatever is present in our common human nature (other than sin) is present in Christ. The reason for this, briefly, is that the saving work of Christ is to heal our ruined human nature, and (in the words of Gregory of Nazianzus), 'what [Christ] has not assumed he has not healed' (Letter 101, *Patrologia Graeca*, vol. 37). The conviction that 'what he has not assumed he has not healed' is one of the main pressures that guided the development of the orthodox 'Chalcedonian' Christology. It was this conviction that made 'fully human' to be for the 'Chalcedonian' party what in the 1960s was called a 'non-negotiable demand'.

At the same time, other pressures made 'fully divine' non-negotiable for most of the parties, including the Chalcedonian party, to the great Christological controversies. One might cite (1) the conviction that the situation of fallen humanity was so desperate that any effective saviour of humanity must be divine, (2) the fact that from the earliest days of Christianity, Christians had offered honours to Christ that it would be blasphemous to offer to a creature, and (3) the realization that the biblical texts quoted above - which at the very least seem to represent Christ as 'very like' God - could not be interpreted as describing Christ as a being who was close to being God but was not quite God, or even as a being who was ontologically intermediate between God and man: no such 'not quite God', no such intermediate, is possible, because any being who is not God is finite, and any finite being must be infinitely closer ontologically to any other finite being than it is to God.

2 Logical problems

The main philosophical problems facing the doctrine of the Incarnation are logical: the doctrine implies, or seems to imply, that there is an object that has various pairs of incompatible properties - or worse (if worse is possible), that there is an object and a property such that that object both has and does not have that property. (God is eternal; Jesus is not eternal; God is identical with Jesus; hence there is something that both is and is not eternal.) Some theologians have held, apparently, that the doctrine does have these features and is therefore internally inconsistent, but is nevertheless to be believed. Having said this, they proceed to deprecate 'merely human logic'. Their point is not that the doctrine *seems* to be inconsistent owing to the deficiencies of merely human logic; it is rather that it is only because of the deficiencies of merely human logic that inconsistency (at least in theology) seems objectionable (see Morris 1986: 24-5 for a nice selection of quotations on this subject). This position has (to be gentle) little to recommend it. It perhaps rests on a failure to see clearly that a truth cannot be inconsistent with a truth.

It would, of course, be possible to maintain that although the orthodox doctrine of the Incarnation seems to be inconsistent, it is in fact consistent, the explanation of the fact that it is, despite appearances, consistent being beyond human understanding. This position will not be discussed in the present entry, for the simple reason that there is little if anything that can be said about it. Rather, various attempts to solve the problem that faces orthodox Christology owing to the *prima facie* inconsistency of the properties it ascribes to the incarnate Christ will be discussed. Philosophically promising solutions will be examined, but with no attempt to trace their historical roots. These solutions are (as perhaps any solution must be) of one or the other of two types:

(1) The orthodox doctrine does not imply all the statements it appears to imply. One or the other of each of the mutually contradictory pairs of statements the doctrine appears to imply it does not in fact imply. (For example, the doctrine appears to imply that Christ began to exist when Herod was king in Judea, and also appears to imply

that Christ's existence had no beginning. But it in fact implies only the latter. Those who have concluded that the doctrine implies the former statement have reached this conclusion on the basis of a superficial understanding of what is contained in the concept of humanity.)
(2) The doctrine does imply all the statements it appears to imply, but these statements are not, as they appear to be, inconsistent. (For example, the doctrine implies that Christ began to exist when Herod was king in Judea, and also implies that Christ's existence had no beginning. But these two statements are consistent. Those who have concluded that they are inconsistent have reached this conclusion on the basis of a superficial understanding of their logical form.)

We shall call solutions of the former type 'attributive' and solutions of the latter type 'predicative'. These words are no more than convenient labels. Neither corresponds to any school or division in the history of theology.

3 Attributive solutions

Is it not possible that we sometimes read more into certain of the attributes that orthodoxy ascribes to Christ than is really there? We tend to assume that a human being must have a beginning in time, and that this is part of the concept of a human being. But what justifies this assumption? We tend to assume that whatever is a human being is essentially a human being. But, again, what justifies this assumption? Even if Solomon and Catherine the Great and all other 'ordinary' human beings have a temporal origin - even if they all have this property essentially - and even if they are all essentially human, does it follow that there could not be an eternal being who acquired the attribute of humanity at a certain point in time? Is there something about the concept of humanity that makes the idea of such a being a conceptual impossibility? Or is there something about the attribute of humanity that makes the idea of such a being a metaphysical impossibility? We may think so - but how do we know? Are we prepared to assert confidently that an alleged divine revelation that implied the existence of such a being would have to be judged a fraud or fantasy of merely human origin? (No doubt we ought to be prepared to assert this in respect of an alleged divine revelation that implied that the walls of the New Jerusalem would be both square and circular.) Or consider omnipresence. A human being must be locally present somewhere, but does it follow that a human being cannot be omnipresent? We must remember that local presence and omnipresence are two different modes of presence. It is indeed impossible for one and the same being to be both locally present everywhere (like the luminiferous ether) and locally present only at a certain spot on the shores of the Sea of Galilee - but omnipresence is not local presence everywhere (see Omnipresence §4). Again: is it really impossible for a human being to be omnipotent? If an omnipotent being took on a set of properties such that whatever had those properties would be human, it would thereby acquire a certain set of powers or abilities, a set that might be the whole set of the powers had by an 'ordinary' human being; but might this set not be simply a (rather small) subset of the set of all its powers - might that being not continue to be omnipotent? Might it not continue to be able to move mountains? (Only, of course, in the way it had been able to move mountains before it took on its 'new' set of properties and powers: it would be unable to move mountains by using its limbs to exert physical pressure on them, even as Solomon and Catherine were unable to do this.) Similar questions can be asked in respect of omniscience.

If a human being can indeed be omnipresent, omnipotent and omniscient, then one might address the problem of the apparent logical inconsistency of the doctrine of the Incarnation simply by denying it reality and asserting, without qualification, that Jesus of Nazareth was omnipresent, omnipotent and omniscient. Whether this solution is philosophically coherent could be debated interminably. But there is also the question whether it is in fact usable by Christians (who are, of course, the only people who have a use for it), for it is certainly arguable that it is inconsistent with the data of the New Testament, in which Jesus is sometimes represented as unable to do certain things and as learning things of which he had hitherto been ignorant and, in one case, as simply not knowing the exact day and hour of the end of the age (Matthew 24: 36; Mark 13: 32). It would no doubt be possible to insist that the passages in the New Testament that represent Jesus as subject to many of the limitations of ordinary human existence can be reconciled with the thesis that he is omnipotent, omniscient and omnipresent - rather as many have found it possible to insist that the doctrine of a timeless, impassible God can be reconciled with the narratives of the Pentateuch. But it would seem that a solution to the problem would be more attractive to most Christians if it allowed Jesus to share our human limitations.

There is an attributive solution that claims to have this feature. It is called *kenoticism*, from the Greek *kenosis* ('emptying'), an account of the nature of the Incarnation that is based on the statement (Philippians 2: 7) that, in

becoming incarnate, Christ 'emptied' himself. Whatever the correct interpretation of the difficult passage in which this statement occurs may be, kenoticism holds that, in becoming incarnate, Christ relinquished omnipotence, omniscience, omnipresence and various other of what are commonly called the divine attributes (although it continued to be true of him that he was morally perfect, had no beginning in time and was not a created being). Kenoticists do not, however, hold that when Christ had become incarnate *no one* was omnipotent and omnipresent. This entry has not so far touched on the relation of the doctrine of the Incarnation to the doctrine of the Trinity, but the two doctrines intersect on the following point: it was the second person of the Trinity alone, God the Son, who became incarnate. According to the kenotic theory, God the Son 'emptied himself' of omnipotence and omnipresence, but God the Father and God the Holy Spirit continued to possess these attributes.

Kenoticism, it will be noted, requires a 'rethinking' of divinity and various of the divine attributes as well as of humanity. We are inclined to think that a being that had attributes such as omniscience and omnipotence would have to have them essentially - and hence that that being could not relinquish them. But how, the kenoticist asks, do we know this? We are also inclined to think that a being who was not omniscient or omnipotent at *t* would not be at *t* a divine being. But how do we know this? How do we know that, for example, omnipotence is really a divine attribute, really entailed by divinity? Might it not be that it is not strictly omnipotence that is entailed by divinity, but rather some 'weaker' attribute - perhaps 'omnipotence unless omnipotence is voluntarily relinquished'?

It is very doubtful whether kenoticism can be reconciled with orthodoxy. The following two difficulties are apparent. First, the theory does not mesh well with orthodox Trinitarian theology, for it seems to imply that the persons of the Trinity are distinct substances, distinct *beings*, and hence to imply tritheism (see Trinity §§1-2). Second, the theory allows the incarnate Christ to be divine only by considerably 'weakening' the concept of divinity. The incarnate Christ can indeed say truly 'I am a divine being', but only because, for the kenoticist, it is possible to be a divine being at a certain moment without then being omnipotent, omniscient or omnipresent. It is doubtful whether kenoticism can be reconciled with the following two requirements: 'the property [that is, defining properties or essential features] of each nature being preserved' (Definition of Chalcedon); 'not by the transformation of his divinity into flesh' (Athanasian Creed). Even if kenoticism can, by artful interpretations of their language, be reconciled with the letter of the two documents, it certainly cannot be reconciled with their spirit. (Kenoticism is a nineteenth-century invention and did not, therefore, influence the wording of the Definition or the Creed. There can be no real doubt that they would have been so worded as to exclude it if it had existed in the fifth century.)

Thomas Morris (1986) has defended an attributive solution that both takes into account the biblical data concerning the human limitations of Christ and retains a robust concept of divinity. Morris accounts for the biblical data by suggesting that Christ, in becoming incarnate, acquired a human mind without thereby relinquishing his divine mind. (The divine mind that Christ retains is not, according to Morris, 'divine' only in some etiolated, kenotic sense: it remains, for example, omniscient.) Between the two minds there exists an 'asymmetrical accessing relation': only a minuscule segment of what is present in the divine mind is accessible to the human mind. Christ's human limitations are to be traced to the limitations of his human mind, and it is this mind whose thoughts and sufferings are recorded in the Gospels.

Morris' solution is certainly to be preferred both to the 'unqualified' solution and to kenoticism. One might wonder, however, whether it is not a form of monophysitism. (This point could also have been brought against the 'unqualified' solution.) Morris' solution represents Christ's human mind as a 'subsystem' of his divine mind - which is, after all, really just his mind, his mind *simpliciter*. And although Christ has (on the physical side) weight and shape and local presence - all the physical properties that someone needs to be fully human - these are simply properties that God has acquired, 'additions' to the properties that he had before the Incarnation. It would seem, therefore, that Morris' solution inherits the following feature of the 'unqualified' solution: it represents the incarnate Christ as a single substance, a divine substance that, by becoming incarnate, acquired certain properties that would otherwise belong only to created beings. Morris would certainly vigorously affirm the presence of two natures in the incarnate Christ, but his account of what this means seems to be very like the account given by those monophysites who were willing to accept the 'two natures' terminology: 'It is the claim of orthodoxy that Jesus had all of the [essential] properties of humanity, and all the [essential] properties of divinity, and thus existed (and continues still to exist) in two natures' (Morris 1986: 40). The definitional statements that an advocate of Morris'

solution would have to pay special attention to are these: 'made known in two natures without confusion [without running together]' (Definition of Chalcedon); 'not by confusion of substance' (Athanasian Creed).

4 Predicative solutions

Predicative solutions concede that pairs of predicates like 'is eternal' and 'was born of a human mother in 6 BC' are inconsistent. But advocates of these solutions maintain that the real logical form of some or all sentences of the superficial form 'Christ is *F*' is not what that superficial form suggests. There are two, or perhaps three, ways a sentence of this form can be construed: 'Christ is *F qua* God (as regards his divinity)', 'Christ is *F qua* man', and, possibly, 'Christ is *F* without qualification (*simpliciter*)'. Predicative solutions contend, moreover, that pairs of sentences like 'Christ is eternal *qua* God' and 'Christ was born of a human mother in 6 BC *qua* man' are consistent. (It would seem natural to suppose that proponents of predicative solutions - since they concede that 'is eternal' and 'was born…' are inconsistent - must regard 'Christ is eternal *simpliciter*' and 'Christ was born of a human mother in 6 BC *simpliciter*' as inconsistent. Indeed, it would seem natural to suppose that they would have to say that it was false that Christ had either his 'exclusively divine' or his 'exclusively human' attributes *simpliciter*, and would allow only that he had each of them *qua* God or *qua* man, as appropriate - although they might hold that Christ had certain attributes, such as moral perfection, *simpliciter*. But some 'predicativists' may refuse to recognize the '*simpliciter*' mode of predication. And at least one 'predicativist' author explicitly treats such pairs of sentences as consistent, for reasons that will be given below.)

'Predicativism', so understood, is unquestionably orthodox. But it is doubtful whether it constitutes a solution to the problem of the apparent inconsistency of orthodox two-natures Christology. A satisfactory predicative solution must supplement the abstract theses of the preceding paragraph with some sort of reply to the following challenge:

Where *F* and *G* are incompatible properties, and K_1 and K_2 are 'kinds', what does it mean to say of something that it is *F qua* K_1 but *G qua* K_2? - or that it is *F qua* K_1 but is not *F qua* K_2? And can any more or less uncontroversial examples of such pairs of statements be found?

R.T. Herbert (1979) has offered an example of such a pair of statements. Consider ambiguous figures, like the familiar 'duck-rabbit'. One could point at such a figure and say truly both, 'That has ears *qua* rabbit' and 'That has no ears *qua* duck'. But this example immediately suggests a question: what does the word 'that' refer to? Certainly not to the ambiguous figure. The *figure* belongs neither to the kind 'rabbit' nor to the kind 'duck', and therefore, presumably, has no properties *qua* rabbit or *qua* duck. (And if 'that' does not refer to the figure, what does it refer to?) It may be true that the figure has the property 'representing something with ears' *qua* rabbit-representation and lacks this same property *qua* duck-representation. If so, this would be an example of a pair of '*qua*' statements of the forms the above challenge has demanded. But it does not seem that this example will be of use in Christology, for the property the figure has '*qua* something' and lacks '*qua* something else' is a representational property, and Christ, not being a drawing or a statue, has no representational properties. (It is not accidental to the example that the property it involves is representational, and the example provides the inquirer with no clue as to how to construct an example involving a property that is not representational.) It is true that one biblical quotation describes Christ as 'the exact representation [*charaktér*] of [God's] nature' (Hebrews 1: 3). But this means that Christ is a 'perfect copy' of God, and does not imply that any of Christ's properties is a representational property. (A daughter who is the 'spit and image' of her mother is not a representation of her mother in the way a portrait of her mother is.)

Peter van Inwagen (1994) has presented a very comprehensive and general predicative solution to the problem of the apparent inconsistency of the doctrine of the Incarnation. It has been observed by several authors that Peter Geach's thesis of the 'relativity of identity' can be employed to solve the 'Leibniz's Law' problems faced by the doctrine of the Trinity (see Trinity §3). Van Inwagen has shown that the techniques employed in this solution can be extended to solve the similar problems faced by the doctrine of the Incarnation. The following is a simplified version of van Inwagen's solution.

Suppose that, although God is not (of course) the same substance or being as the human being Jesus of Nazareth, he is nevertheless the same *person* - the same 'I' or 'thou' or 'he'. (This assumption has two closely related presuppositions: that it is possible for *x* to be the same person as *y* but not the same substance; and that if *x* is the same person as *y*, and *x* has the property *F*, it does not follow that *y* has *F*.) Let the adjective 'Nazarene' represent

some conjunction of 'human' properties that uniquely identify the human being Jesus of Nazareth. We may now offer the following three definitions:

Jesus Christ is *F simpliciter*:

Something *x* is such that: something divine is the same person as *x*; and something Nazarene is the same person as *x*; and *x* is *F*.

Jesus Christ is *F qua* God:

Something *x* is such that: something divine is the same person as *x*; and something Nazarene is the same person as *x*; and *x* is divine; and *x* is *F*.

Jesus Christ is *F qua* man:

Something *x* is such that: something divine is the same person as *x*; and something Nazarene is the same person as *x*; and *x* is human; and *x* is *F*.

The two latter definitions have the expected and desired consequences. The following two consequences of the first, however, although not unorthodox, are certainly somewhat counterintuitive: Jesus Christ is eternal *simpliciter* (since something divine and something Nazarene are the same person, and the former is eternal), and Jesus Christ had a beginning in time *simpliciter* (since something divine and something Nazarene are the same person, and the latter had a beginning in time). Using constructions like those illustrated in the three definitions, van Inwagen has shown how to correlate each statement endorsed by the orthodox doctrine of the Incarnation with a statement in a formal language comprising only the two 'relative identity' predicates 'is the same being as' and 'is the same person as' and a small stock of additional predicates. (The formal language contains no names or descriptions; it contains no terms but variables.) He has shown that the set of statements in the formal language that are correlated with the set of statements that orthodoxy endorses are formally consistent (given a certain explicitly stated set of rules that defines valid inference in the formal language). This 'solution' to the problem of the apparent logical inconsistency of the doctrine of the Incarnation, unlike the other solutions we have examined, has no ontological content. Van Inwagen makes no attempt at a metaphysical analysis of divinity or humanity; his project is simply to set out a formal representation of the orthodox doctrine that is provably formally consistent.

His solution raises at least two serious questions (if, indeed, metaphysically empty as it is, it is proper to call it a solution). First, do the two 'closely related presuppositions' mentioned above (that it is possible for *x* to be the same person as *y* but not the same substance; and that if *x* is the same person as *y*, and *x* has the property *F*, it does not follow that *y* has *F*) really make any logical sense? Second, van Inwagen's constructions represent the statements of traditional Incarnational theology as having very different logical forms from those they appear to have. (For example, given the appropriate theological assumptions, the sentence 'Jesus Christ is eternal *qua* God' is true on his analysis - but not because 'Jesus Christ' is a singular referring expression that denotes an object that has, on those assumptions, the property expressed by the predicate 'is eternal *qua* God'.) In view of this fact, can these constructions plausibly be held to represent the intended content of the traditional statements?

Incommensurability

When one scientific theory or tradition is replaced by another in a scientific revolution, the concepts involved often change in fundamental ways. For example, among other differences, in Newtonian mechanics an object's mass is independent of its velocity, while in relativity mechanics, mass increases as the velocity approaches that of light. Earlier philosophers of science maintained that Einsteinian mechanics reduces *to Newtonian mechanics in the limit of high velocities. However, Thomas Kuhn (1962) and Paul Feyerabend (1962, 1965) introduced a rival view. Kuhn argued that different scientific traditions are defined by their adherence to different* paradigms, *fundamental perspectives which shape or determine not only substantive beliefs about the world, but also methods, problems, standards of solution or explanation, and even what counts as an observation or fact.* Scientific revolutions *(changes of paradigm) alter all these profoundly, leading to perspectives so different that the meanings of words looking and sounding the same become utterly distinct in the pre- and post-revolutionary traditions. Thus, according to both Kuhn and Feyerabend, the concepts of mass employed in the Newtonian and Einsteinian traditions are incommensurable with one another, too radically different to be compared at all. The thesis that terms in different scientific traditions and communities are radically distinct, and the modifications that have stemmed from that thesis, became known as the thesis of incommensurability.*

1 Early phase of the debate

The thesis of incommensurability stemmed from new historical research indicating to some that ' once current views of nature were, as a whole, neither less scientific nor more the product of human idiosyncrasy than those current today' (Kuhn 1962: 2). Transitions from one theory to another seemed no longer understandable as resulting from new evidence forcing the rejection of one theory and the acceptance of a new one. The positivistic idea of evidence common to the rejected view and its replacement, of observations which remained invariant under theoretical change, had become suspect. More radical sorts of change seemed involved, implicating even scientific standards, methods and goals.

In the introduction to *The Structure of Scientific Revolutions* (1962) Kuhn framed the incommensurability claim in terms of ' paradigms', bodies of 'universally recognized scientific achievements that for a time provide model problems and solutions to a community of practitioners'. However, the paradigm itself is more 'global' than formulations in terms of particular theories or achievements. During its period of dominance, the paradigm governs research, shaping the community's ' methods, problem-field, and standards of solution' (1962: 102). Different paradigms shape different conceptions of all these, and also of observations or facts, methods, goals of science, and therefore the definition of the corresponding science. There remain no extra-paradigmatic criteria in terms of which two different paradigms can be compared or judged. Consequently, despite the retention in successive paradigms of many of the same terms (for example, 'mass' in Newtonian and Einsteinian physics), the concepts (presumably, the meanings of the terms) are so different as to be incomparable. Different paradigms are ' not only incompatible but often actually incommensurable with that which has gone before' (1962: 102). Communication between adherents of different paradigms is impossible (see Kuhn, T.S.).

Feyerabend's (1962, 1965) formulation of the thesis is similar to Kuhn's in many respects. He speaks of 'high-level background theories', rather than more 'global' paradigms, which shape the way science is done, and is more explicit than Kuhn in asserting that high-level background theories lie behind languages. Nevertheless, he agrees with Kuhn that at least some fundamental theories are incommensurable. Whereas the early Kuhn was at best ambivalent about the extent of incommensurability between paradigms (see §3), Feyerabend throughout his career asserted that incommensurability is rare, occurring only under special circumstances, the nature of which he never clarified. (Kuhn later came to agree that incommensurability is only 'local'.) The major difference between the two is that while Kuhn believed a scientific community or tradition to be governed by a common paradigm, Feyerabend argued that scientists should try to develop alternative hypotheses, the more radically different from the accepted one the better (see Feyerabend, P.K.).

2 Criticisms of early forms of the thesis

These early forms of the incommensurability thesis were criticized on four general grounds.

First, the thesis as presented is vague and ambiguous. There are problems with the claim itself and what it has to do with. As to the claim itself, it relied on the vague terms ‘paradigm’ and ‘high-level background theory’; but what is a paradigm exactly, especially if it is more ‘global’ than any attempted formulation of it? (Masterman (see Lakatos and Musgrave 1970) pinpoints twenty-one different uses of the word ‘paradigm’ in Kuhn’s 1962 edition of *Scientific Revolutions*.) How, precisely, does it shape or determine the ways members of a tradition or community think - the standards, methods, and so on? Are the ways of thinking deduced from the paradigm, or does the paradigm exercise merely a psychological (rather than logical) control? These and other vagaries infected the incommensurability thesis, and were only aggravated by Kuhn’s frequent but never-explained qualifications of his more radical contentions. Thus he declared, without further comment, that it is only ‘often’ that paradigm changes result in incommensurability. Elsewhere he maintained that ‘ proponents of competing paradigms practise their trades in different worlds … [and] see different things when they look from the same point in the same direction’ (1962: 150). Yet he also alleged that they ‘see different things’ in ‘different areas’, presumably of the same world.

The thesis is also unclear about what it is about different paradigms that is incommensurable. Kuhn himself spoke of three types of incommensurability: conceptual, observational and methodological. Much discussion, both on Kuhn’s part and that of his critics, has centred on the first of these: how is the claim of conceptual incommensurability to be understood? Much of Kuhn’s talk suggests that it has to do with terms like ‘mass’ and their incomparability in different paradigm traditions. But what is it about such terms that is incommensurable? Is it their *meanings* that are so radically different, or their *referents*? Focusing on their meanings (for reference, see §3), what is supposed to be part of the incomparable meaning of a term? There are obviously similarities between the Newtonian and Einsteinian meanings of ‘mass’; if the meanings themselves are held incomparable, the similarities are presumably relegated to the non-meaning portions of their use. Kuhn does not discuss this distinction. Further, are all the terms of a paradigm tradition incommensurable with all those of another, or does incommensurability arise only for some of the terms? Certainly Feyerabend believed that ‘ the meaning of every term we use depends upon the theoretical context in which it occurs’ (1965: 180). Kuhn, too, sometimes wrote as if proponents of different paradigms are ‘always at cross-purposes’, that communication across paradigms is ‘inevitable’, though sometimes he qualified this claim by saying that they are only ‘partially’ so, ‘in some areas’ (1962: 149). But which is it, partial in all areas, complete in some areas, or both? Also, if the paradigm logically *entails* all the ways of thinking within a tradition, everything, presumably including all meanings, will be affected by the profound differences between paradigms; and even if determination by paradigm is only psychological rather than logical, the limits, if any, of such determination are left unclear. We are left wondering what it is that is incomparable, and whether there is anything that is not, and why.

Second, the thesis is incoherent, even self-contradictory. Feyerabend defines ‘incommensurability’ as: ‘ Two theories will be called incommensurable when the meanings of their main descriptive terms depend on mutually inconsistent principles’ (1965: 227). This definition is puzzling, since for two propositions to be inconsistent with one another is for one to assert A and the other not A; but this is to share A and be comparable. In general there is ambiguity as to whether two fundamental theories *compete with*, *contradict* one another, or are strictly incomparable. This ambiguity also occurs in Kuhn when he claims that different paradigms explain in different ways; for this claim seems to require meta-paradigmatic criteria for identifying what counts as an explanation in each of the two paradigms - for saying that they differ in how they do something that can be compared, namely explain.

Third, the thesis leads to relativism - and merely through its vagueness and ambiguity, not through the revelations of its case studies. If a paradigm determines, in some sense, the standards, methods, goals, meanings of terms, and so on, used in a tradition or community, and if two paradigms are incommensurable with regard to these, then what criteria are left for assessing the relative merits of two different paradigms? *Reasons* become paradigm-relative, and there remain no paradigm-transcending reasons to accept one paradigm over another. Furthermore, these relativist consequences follow merely from the fact that paradigm scope and control are left so ambiguous. Much of the text suggests that paradigms control in the sense of determining, either logically or psychologically, all that goes on within a paradigm tradition. If, as Kuhn claimed in later years, this was never his intent, what he did want to say on these points was far from clear (see Epistemic relativism).

Fourth, the thesis is falsified by actual science and its history. A host of historical case studies have purported to

refute (or confirm) the incommensurability thesis. Many such studies, however, uncritically take it for granted that the thesis is clear and unambiguous, and that it need only be confronted with solid historical evidence to be refuted or confirmed.

3 Later phase of the debate

To the 1970 edition of *The Structure of Scientific Revolutions*, Kuhn appended a 'Postscript' replacing the term 'paradigm' with 'disciplinary matrix' and distinguishing four components of this matrix: 'symbolic generalizations', 'metaphysical paradigms', 'values' and 'exemplars' (1970: 182-6). These are transparadigmatic and can be used in comparison and evaluation of paradigms. The 'values' include ' accuracy of prediction…; the balance between esoteric and everyday matter; and the number of different problems solved' (1970: 205-6). However, ' such reasons function as values and…they can thus be differently applied…by men who concur in honoring them' (1970: 199-200). Thus they appeared to be agreed-on standards of comparison in name only, doing little to clarify and defend the thesis of incommensurability.

Kuhn's later writings (for example, 1983) speak decreasingly of paradigms and increasingly of theories and languages. Otherwise, these later papers alter his previous ideas in at least three major respects. First, he advocates a theory of *local incommensurability*, according to which, rather than all meanings changing in revolutions, ' Only for a small subgroup of (usually interdefined) terms and for sentences containing them do problems of translatability arise' (1983: 670-1). Second, he distinguishes a 'narrow sense' of translation, piecemeal if not word-for-word, from 'interpretation', in which piecemeal translation is impossible. Third, combining these first two points, he argues that the interdefined concepts cause translation problems because they divide the world up in distinctive ways, different from the structurings of other theories or languages. This structuring can only be grasped holistically, by becoming familiar with the whole network of interrelations between the concepts and with the assumptions about the world which are made in that interlocked network. This constitutes *interpretation*, through which it is possible to gain an understanding of radically different theories even though *translation in the narrow sense* is impossible. Some critics maintain that the allegedly indissoluble connections of concepts can be disentangled in one way or another, for example, by attending to similarities and differences in the uses of *tokens* of terms (Kitcher) or by introducing a notion of *partial denotation* (Field). Kuhn's response to such arguments is that recognizing similarities and differences of denotation is only a first step in gaining adequate understanding of the alien theory or language. In any case, either on Kuhn's view or the views of such critics, this claim that two different theories can be mutually intelligible removes most of the sting that originally accompanied the charge of incommensurability. Understanding and communication are possible, even perhaps to a degree approximating that attainable through translation.

Other critics remain convinced that incommensurability in some radical sense holds for the *content of belief* of different traditions or fundamental theories, and have therefore turned to other aspects of the total scientific picture for ways of comparing and judging theories. Thus Laudan (1977: 143-5) has emphasized relative problem-solving ability, rather than factual disagreement, as the basis of theory comparison and evaluation. However, Laudan's view requires some unprovided principle of individuation for counting problems, and for giving them different weights on the basis of relative importance, ease of solution, and so on. Other writers have had recourse to formal and evaluative standards or internal consistency.

In recent years, attempts to resolve problems of incommensurability by utilizing the causal theory of reference has been the most influential approach to the incommensurability claim. The causal theory of reference holds that the reference of a term is established not by a set of descriptive conditions having to do with the meaning of the term, but by ostension (roughly, pointing) in an original 'baptismal' ceremony, which reference is passed on to succeeding generations (see Reference §4). Such constant reference can then serve as the basis for saying that very different traditions are continuous and comparable with one another, 'talking about the same thing', despite radical differences that may have come about between their descriptive concepts. There are many variations on this theme. Some writers have suggested that many successive 'baptismal events' can take place for a particular term, adding to or otherwise changing the original reference and extension; again, it has been objected that the references of theoretical terms in science cannot usually be established by pointing, and that some important types of reference must appeal to descriptive criteria. Sankey (1994) incorporates these and other modifications in a version of the causal theory that is consistent with incommensurability but allows comparability, thus harmonizing with Kuhn's

later views. Again, however, this is an extremely weak version of incommensurability. In any case, the near-mythical nature of the baptismal event, the possibility of a succession of these, and the difficulties of satisfactorily interpreting theoretical terms along the lines of the causal theory of reference, all make it unlikely that appeal to that theory can help resolve disputes about the continuity or discontinuity of science.

A further possible solution of worries about incommensurability (Shapere 1989) consists in an analysis of the *reasons* advanced for altering a reference-fixing condition (for example, the particular shape of a track in a cloud chamber under particular conditions) or for making changes in attributions of descriptive properties to theoretical entities (for example, neutrinos). On this view, changes come about in understandable ways, and can be in either reference or meaning. This approach places the burden of analysis on the concept of a reason, rather than on meaning or reference, but it is perhaps closer to the ways scientists actually proceed.

Indian and Tibetan philosophy

The people of South Asia have been grappling with philosophical issues, and writing down their thoughts, for at least as long as the Europeans and the Chinese. When Hellenistic philosophers accompanied Alexander the Great on his military campaigns into the Indus valley, on the western edge of what is now the Republic of India, they expressed delight and amazement upon encountering Indians who thought as they thought and lived the sort of reflective life that they recommended living.

Nearly all philosophical contributions in India were made by people writing (or speaking) commentaries on already existing texts; to be a philosopher was to interpret a text and to be part of a more or less well-defined textual tradition. It is common, therefore, when speaking of Indian philosophers, to identify them as belonging to one school or another. To belong to a school of philosophy was a matter of having an interpretation of the principal texts that defined that school. At the broadest level of generalization, Indians of the classical period were either Hindus, Buddhists or Jainas (see Buddhist philosophy, Indian; Hindu philosophy; Jaina philosophy). In addition to these three schools, all of which were in some sense religious, there was a more secular school in the classical period, whose tenets were materialistic and hedonistic (see Materialism, Indian school of). The end of the classical period in Indian philosophy is customarily marked by the arrival of Muslims from Turkey and Persia at the close of the first millennium. The contributions of Indian Muslims added to the richness of Indian philosophy during the medieval period (see Islamic philosophy).

Writing was introduced into Tibet not long after the arrival of Buddhism from India in the seventh century. The earliest literature of Tibet was made up mostly of Buddhist texts, translated from Indian languages and from Chinese. Eventually, ideas associated with Bon, the indigenous religion of Tibet, were also written down. Tibetan philosophers followed the habit of Indians in that they made their principal contributions by writing commentaries on earlier texts (see Tibetan philosophy). Key Buddhist philosophers from Tibet are Sa skya Paṇḍita (1182-1251), Tsong kha pa Blo bzang grags pa (1357-1419), rGyal tshab dar ma rin chen (1364-1432), mKhas grub dge legs dpal bzang po (1385-1438) and Mi bskyod rdo rje (1507-54).

1 Hindu philosophy

The philosophical schools associated with what we now call Hinduism all had in common respect for the authority of the Veda (‘Knowledge’), scriptures accepted as a revealed body of wisdom, cosmological information and codes of societal obligations. The textual schools that systematized disciplines derived from the Veda were the Mīmāṃsā, the Nyāya, the Vaiśeṣika, the Sāōkhya and the various Vedānta schools (see Mīmāṃsā; Nyāya-Vaiśeṣika; Sāōkhya; Vedānta). Concerned as all these schools were with correct interpretation of the Veda, it is natural that questions of language were of paramount importance in Indian philosophy (see Language, Indian theories of; Meaning, Indian theories of). These involved detailed investigation into how subjects are to be defined and how texts are to be interpreted (see Definition, Indian concepts of; Interpretation, Indian theories of).

Closely related to questions of language were questions of knowledge in general and its sources (see Epistemology, Indian schools of; Knowledge, Indian views of). The two most important sources of knowledge that Indian philosophers discussed were sensation and inference, the theory of inference being important to the development of logic in India (see Sense perception, Indian views of; Inference, Indian theories of). Another topic about which Indian thinkers had much to say was the problem of how absences are known (see Negative facts in classical Indian philosophy). Because of the importance of scriptures and religious teachers, epistemologists in India discussed the issue of the authority of texts and the question of the reliability of information conveyed through human language (see Testimony in Indian philosophy). The questions associated with epistemology are in Indian philosophy often closely connected with questions of human psychology (see Awareness in Indian thought; Error and illusion, Indian conceptions of).

Most schools of Indian philosophy offered not only an epistemology but also an ontology (see Ontology in Indian philosophy). Many posited a personal creator god or an impersonal godhead (see God, Indian conceptions of; Brahman; Monism, Indian). Just how particular things come into being through creative agency or through impersonal natural laws was a matter of considerable debate (see Causation, Indian theories of; Cosmology and cosmogony, Indian theories of). Indian thinkers also debated the precise nature of matter, the ontological status of

universals, and how potentials become actualities (see Matter, Indian conceptions of; Universals, Indian theories of; Potentiality, Indian theories of).

In addition to epistemology and metaphysics, a third area that Indian systematic philosophers nearly always commented upon were issues concerning the nature of the human being (see Self, Indian theories of; Mind, Indian philosophy of). This included thoughts on a variety of ethical questions and the rewards for living an ethical life (see Duty and virtue, Indian conceptions of; Karma and rebirth, Indian conceptions of; Fatalism, Indian; Heaven, Indian conceptions of). While most thinkers dealt with individual ethics, some also gave attention to the question of collective behaviour and policy (see Political philosophy, Indian).

The Hindu tradition produced a number of important individual philosophers. Among the earliest extant philosophers from India are the political theorist Kauṭilya (fourth century BC) and the grammarian and philosopher of language Patañjali (second century BC). The legendary founder of the Nyāya school, Akṣapāda Gautama, is traditionally regarded as the author of a set of aphorisms that modern scholars believe were composed in the second or third century. These aphorisms present the basic ontological categories and epistemological principles that were followed not only by the Nyāya school but by many others as well. The philosopher of language Bhartṛhari (fifth century) developed the intriguing idea that the basic stuff of which all the universe is made is an intelligence in the form of a readiness to use language. Vātsyāyana (fifth century) and Uddyotakara (sixth century) were both commentators on Gautama. The Vedānta systematist Śaōkara (eighth century) wrote that realizing the underlying unity of all things in the form of Brahman could set one free. The aesthetician Abhinavagupta (tenth-eleventh century) made the education of the emotions through the cultivation of aesthetic sensitivity the basis of liberation from the turmoil of life. Udayana (eleventh century) of the Nyāya school developed important arguments for the existence of God. Rāmānuja (eleventh-twelfth century) and Madhva (thirteenth century), both Vedāntins, offered systems that became serious rivals to Śaōkara's monism. The work of the logician Gaōgeśa (fourteenth century), who revised the classical system of logic and epistemology, became the foundation for an important new school of thought, Navya-Nyāya ('New Nyāya'). Mādhava (fourteenth century) and Vallabhācārya (fifteenth-sixteenth century) made important contributions to Vedāntin philosophy. Gadādhara (seventeenth century) continued making advances in logical theory by building on the work of Gaōgeśa. Also important in the sixteenth century were several thinkers who commented upon the religious thinker Caitanya (see GauḌĪya VaiṢṆavism). Finally, there were several thinkers and movements in the nineteenth and twentieth centuries, a period during which Indian intellectuals struggled to reconcile traditional Indian ways of thinking with European and especially British influences (see Aurobindo Ghose; Gandhi, M.K.; Radhakrishnan, S.; Tagore, R.; Arya Samaj; Brahmo Samaj; Ramakrishna Movement).

2 Buddhist and Jaina philosophy

As was the case for Hindu philosophy, Buddhist and Jaina Philosophy in India tended to proceed through commentaries on already existing texts. Jainism was founded by Mahāvīra and is best known for its method of seeing every issue from every possible point of view (see Manifoldness, Jaina theory of). The principal Buddhist traditions that incorporated significant philosophical discussions were those that tried to systematize doctrines contained in various corpora of texts believed to be the words of the Buddha (see Buddhism, Ābhidharmika schools of; Buddhism, Mādhyamika: India and Tibet; Buddhism, Yogācāra school of). An important issue for Buddhist thinkers, as for most Indian philosophers, was analysing the causes of discontent and suggesting a method for eliminating unhappiness, the cessation of suffering being a condition known as *nirvāṇa* (see Suffering, Buddhist views of origination of; Nirvāṇa). A doctrine of special interest to the Mādhyamika school was that everything is conditioned and therefore lacking independence (see Buddhist concept of emptiness). Some Buddhists developed the view that the conditioned world is so transitory that it disappears and is recreated in every moment (see Momentariness, Buddhist doctrine of). In the area of epistemology and philosophy of language, some Buddhists repudiated the Hindu confidence in the authority of the Veda (see Nominalism, Buddhist doctrine of).

The Buddhist tradition gave India a number of important philosophers, beginning with the founder of the religion, the Buddha (fifth century BC). The first important Buddhist philosopher to write in Sanskrit and the man traditionally regarded as the founder of the Mādhyamika school was Nāgārjuna (second century). A key commentator in both the Ābhidharmika schools and in the Yogācāra school was Vasubandhu (fifth century). Two key Buddhist epistemologists and logicians were Dignāga (fifth century) and Dharmakīrti (seventh century).

Buddhism disappeared from northern India in the twelfth century and from southern India a few centuries later. In the twentieth century, there has been an effort to revive it, especially among the community formerly known as ‘untouchables’. A remarkable leader of this community was Bhimrao Ramji Ambedkar.

3 Pronunciation of Sanskrit words

Sanskrit is an Indo-European language, closely related to Greek and Latin. In India, it is written in a variety of phonetic scripts, and in the West it is customary to write it in roman script. Many letters used to write Sanskrit are pronounced almost as they are in English; k, g, j, t, d, n, p, b, m, y, r, l, s and h can be pronounced as in English without too much distortion. The sound of the first consonant in the English word ‘church’ is represented by a simple ‘c’ in Sanskrit. In addition to these consonants there is a class of retroflex consonants, so called because the tongue is bent back so that the bottom side of the tongue touches the roof of the mouth. These sounds are represented by letters with dots under them: ṭ, ḍ, ṇ and ṣ. As in English, some consonants are heavily aspirated, so that they are pronounced with a slight puff of air. These consonants are represented by single letters in Indian scripts but by two-letter combinations in roman script; thus ‘kh’ is pronounced as the ‘k’ in English ‘kill’, ‘th’ as ‘t’ in ‘tame’ (never as ‘th’ in ‘thin’ or ‘there’), ‘dh’ as in ‘mudhouse’, and ‘ph’ as ‘p’ in ‘pat’ (never as ‘ph’ in ‘philosophy’). The letter ‘ś’ is approximately like ‘sh’ in ‘shingle’. The letter ‘ō’ is like ‘ng’ in ‘finger’ or ‘nk’ in ‘sink’, while ‘ñ’ is approximately like ‘ny’ in ‘canyon’.

Vowels are pronounced approximately as in Spanish or Italian. Vowels with a macron over them (ā, ī and ū) are pronounced for twice as much time as their unmarked equivalents. The vowel ‘ṛ’ is pronounced with the tip of the tongue elevated towards the roof of the mouth, very much like the ‘er’ in the American pronunciation of ‘carter’. The diphthongs ‘ai’ and ‘au’ are pronounced as ‘i’ in ‘kite’ and ‘ou’ in ‘scout’ (or almost as ‘ei’ and ‘au’ are pronounced in German) respectively. Accent tends to be on the third syllable from the end; thus the name ‘Ś āōkara’ sounds like ‘SHANG-ka-ra’, not ‘shang-KA-ra’. If the second syllable from the end is long, then it is accented; ‘Dignāga’ is pronounced ‘dig-NAA-ga’.

4 Pronunciation of Tibetan words

Tibetan is a language of the Sino-Tibetan family, which includes various languages spoken in China as well as Burmese and Thai. It is written in a phonetic alphabet derived from the Brahmi script of India, from which most modern Indian scripts, as well as the alphabets used to write Sinhalese, Thai and Mon, are also derived. There are many different systems commonly used by Europeans to transliterate the spelling of Tibetan words. In this encyclopedia, the system designed by T. Wylie is used for transliteration, and a system used at the University of Virginia is used to indicate approximate pronunciation of names.

The spelling of Tibetan words was fixed over a millennium ago and has not changed since. Pronunciation, however, has shifted. Unfortunately, it has not shifted in exactly the same way in every region of Tibet, with the result that the same written word may be pronounced quite differently in the east of Tibet from the way it is pronounced in the west and the central region. The University of Virginia system of indicating pronunciation captures the dialects of central Tibet, which have shifted the greatest distance from the pronunciations of a millennium ago. Consequently, many combinations of letters are not pronounced at all as they once were, and numerous letters have become silent in modern central Tibetan dialects. Given all these changes, the pronunciation of some Tibetan words can be surprisingly different from what one might expect from their spelling.

Many single letters and combinations are pronounced about as in Sanskrit, as described above; so k, kh, g, ō, c, j, ñ, t, th, d, n, p, ph, b, m, y, r, l, s and h can be pronounced as described there. The pairs of letters ‘ts’ and ‘dz’ represent single letters in the Tibetan alphabet and are pronounced as they would be in English ‘cats’ and ‘adze’ respectively. The letters ‘tsh’ represent a single Tibetan letter that is pronounced like an aspirated version of ‘ts’. The combination ‘sh’ is used to represent a Tibetan letter that is pronounced about like ‘sh’ in ‘show’. Some combinations of Tibetan letters are no longer pronounced as they were when spelling was fixed. Examples of this are ‘kr’, ‘tr’ and ‘pr’, all of which are now pronounced the same way, approximately as the ‘tr’ in ‘trick’. Similarly, ‘gr’, ‘dr’ and ‘br’ are all pronounced about like ‘dr’ in ‘drink’. When the letters ‘g’, ‘b’, ‘m’, ‘r’, ‘l’ and ‘s’ occur at the beginning of a syllable and are followed immediately by any consonant other than ‘r’ or ‘l’, they are usually silent. The letter ‘s’ at the end of a syllable is usually silent. Thus ‘bsdigs’ is pronounced somewhere between English ‘dig’ and ‘dick’.

The Tibetan script does not have upper-case and lower-case letters, so there is no custom of writing proper names any differently from ordinary words. In roman transliteration, however, it is customary to capitalize the first pronounced letter of a name. In the name 'rGyal tshab', for example, the silent 'r' is not capitalized. Similarly, in 'mKhas grub' the silent 'm' is not upper case.

Tibetan consonants are pronounced with no trace of aspiration or with heavy aspiration. To the English ear attuned to hearing aspiration about midway between that used in Tibetan consonants, Tibetan 't' can sound like English 'd' and vice versa. Similarly, Tibetan 'k' and 'p' can sound like English 'g' and 'b' respectively. At the end of words, Tibetan 'g' and 'b' may sound like English 'k' and 'p' respectively. It is for this reason that the Virginia phonetic system renders 'Tsong kha pa' as 'Dzong-ka-ba' and 'rGyal tshab' as 'Gyel-tsap'. In the name 'mKhas grub rje' we can see many of the principles discussed above represented in its Virginia rendering as 'kay-drup-jay'.

Indicative conditionals

Examples of indicative conditionals are 'If it rained, then the match was cancelled' and 'If Alex plays, Carlton will win'. The contrast is with subjunctive or counterfactual conditionals, such as 'If it had rained, then the match would have been cancelled', and categoricals, such as 'It will rain'.

Despite the ease with which we use and understand indicative conditionals, the correct account of them has proved to be very difficult. Some say that 'If it rained, the match was cancelled' is equivalent to 'Either it did not rain, or the match was cancelled'. Some say that the sentence asserts that the result of 'adding' the supposition that it rained to the actual situation is to give a situation in which the match was cancelled. Some say that to assert that if it rained then the match was cancelled is to make a commitment to inferring that the match was cancelled should one learn that it rained. This last view is often combined with the view that indicative conditionals are not, strictly speaking, true or false; rather, they are more or less assertible or acceptable.

1 Indicative and material conditionals

In general an 'indicative conditional' has the form 'If *A* then *C*', where *A* is called the antecedent and *C* the consequent. A central issue is the relationship between the truth-value of a conditional and the truth-values of its antecedent and consequent. This much is immediately plausible: if *A* is true and *C* is false, then the conditional is false. If I say 'If it rained, the match was cancelled', and what happened was that it rained but the match went ahead, then what I say is clearly false. There are three other possibilities: *A* and *C* are both true, *A* is false and *C* is true, and *A* and *C* are both false. There are a number of arguments designed to show that in each of these cases the conditional is true. Here is one. 'If *A* then *C*' is intuitively equivalent to the disjunction 'Either not-*A*, or *A* and *C*'. (Instead of saying that if it rained the match was cancelled, I could have said 'Either it did not rain, or it did and the match was cancelled'.) But the latter is true in all three cases: in each, either the first disjunct ('not-*A*') or the second disjunct ('*A* and *C*') is true. A conditional that is false when its antecedent is true and its consequent false, and true in all other cases, is called a 'material conditional', and is symbolized '$A \supset C$' (read '*A* hook *C*'). '$A \supset C$' is definitionally equivalent to 'Not-*A* or *C*'. Hence the argument's conclusion is that indicative conditionals are equivalent to material conditionals. This conclusion has the virtue of validating the two most obviously valid inferences governing conditionals - *modus ponens*: '*A*, if *A* then *C*, therefore, *C*', and *modus tollens*: 'Not-*C*, if *A* then *C*, therefore, not-*A*'.

Despite the appeal of the argument, there are serious problems for the equivalence thesis that indicative conditionals are material conditionals. It entails that any conditional with a false antecedent is true regardless of its consequent, that is, the account validates 'Not-*A*, therefore, if *A* then *C*'. This is implausible. 'If I live in London then I live in Scotland' strikes us as false (it is rather 'If I live in London then I do not live in Scotland' which is true), but because I do not live in London, it is true on the equivalence thesis. Also, it entails that any conditional with a true consequent is true: the account validates '*C*, therefore, if *A* then *C*'. But 'If I live in London, then I live in Australia' strikes us as false even after we learn that I do in fact live in Australia. These two results are known as the paradoxes of material implication ('material implication' being the name of the relation between *A* and *C* when '$A \supset C$' is true).

2 Possible worlds treatments

An obvious response to the paradoxes is to insist that more than the truth of '$A \supset C$' is required in order for 'If *A* then *C*' to be true; that the truth of '$A \supset C$' is a necessary but insufficient condition. One way to do this is to require a connection between antecedent and consequent; to hold that part of what makes 'If it rains, the grass will grow' true is the connection between rain and grass growing. This blocks the paradoxes. However, we sometimes use conditionals precisely to deny that there is a connection between antecedent and consequent. A doctor who says that if you go to bed and take an aspirin you will get better in a week, whereas if you go to work it will take seven days, is saying that there is no connection between going to bed and getting better.

A more promising approach is to require that the material conditional not only be true the way things actually are, but be true in the closest possible worlds where the antecedent is true (see Semantics, possible worlds). Roughly, the account is: 'If *A* then *C*' is true iff '$A \supset C$' is true, that is, true the ways things actually are *and also* true in

the closest possible worlds where *A* is true. Another way of saying the same thing is: 'If *A* then *C*' is true iff the closest worlds in which *A* is true are worlds in which *C* is also true. (This is because any world where *A* and '$A \supset C$' are true is a world where *C* is true.) The appeal of this approach derives from the appeal of the idea that when we evaluate a conditional we look at the way things actually are and 'in imagination' add the antecedent and then see whether, with only the changes forced by adding the antecedent, the consequent comes out true.

This approach is very attractive for subjunctive or counterfactual conditionals (see Counterfactual conditionals) but faces a problem when applied to indicative conditionals. (Interestingly, one architect of the possible worlds approach to conditionals, David Lewis (1973), only ever intended it to apply to subjunctive conditionals. Robert Stalnaker, the other architect (1968), intended it to apply to both.) It construes indicative conditionals as being in part about the way things might have been but are not in fact. That seems exactly right for subjunctives. When I say that had I invested in Western Mining ten years ago, I would now be rich, I am saying how things are in some possible but regrettably non-actual world. Indeed, I might express this by saying that had I invested in Western Mining ten years ago, things would now be different - and better - than they actually are. But I cannot say this in the indicative mood: 'If I invested in Western Mining ten years ago, things are different from the way they actually are' is nonsense. Or consider the difference between 'If Oswald had not shot Kennedy, Kennedy would have won a second term' and 'If Oswald did not shoot Kennedy, Kennedy won a second term'. The reason we reject the second, despite accepting the first, is that we know that the way things actually are Kennedy did not live to win a second term. Subjunctive conditionals typically concern non-actual worlds, whereas indicative conditionals concern the actual world under various hypotheses about what it is like. Thus we say that if Oswald did not shoot Kennedy, someone else did, because that is the only thing to think about the actual world (in which we know that Kennedy was shot) given that Oswald was not responsible.

3 Adams and Lewis

What about the acceptance or justified assertion conditions, as opposed to truth-conditions, for indicative conditionals? Many, including particularly Ernest Adams (1975), have urged that it is justified to assert 'If *A* then *C*' to the extent that *C* is probable given *A*. Because the probability of *C* given *A* - in symbols, $Pr(C|A)$ - is (roughly) the probability we ascribe to *C* on learning *A* (see Probability, interpretations of §5), this suggestion fits nicely with the plausible idea that one is prepared to assert 'If *A* then *C*' to the extent that one is prepared to infer *C* on learning *A*. It also explains our reluctance to assert together 'If *A* then *C*' and 'If *A* then not-*C*' when *A* is consistent, for when *A* is consistent, $Pr(C|A) = 1 - Pr(\text{not-}C|A)$, so they cannot be high together.

Can we explain this assertibility condition in terms of truth-conditions? David Lewis (1976) showed that it cannot be the case that the truth-conditions of 'If *A* then *C*' are such that *Pr*(If *A* then *C*) = $Pr(C|A)$. For then this equality would hold for all probability functions *Pr*, and that leads to trouble as follows:

$$Pr(\text{If } A \text{ then } C) = Pr(\text{If } A \text{ then } C|C).Pr(C) + Pr(\text{If } A \text{ then } C|\text{not-}C).Pr(\text{not-}C),$$

by expansion by cases. But if *Pr*(If *A* then *C*) = $Pr(C|A)$ holds for all *Pr*, then it holds for $Pr(-|C)$ and $Pr(-|\text{not-}C)$, as the class of probability functions is closed under conditionalization. This means that

$$Pr(\text{If } A \text{ then } C|C) = Pr(C|A.C)$$
$$Pr(\text{If } A \text{ then } C|\text{not-}C) = Pr(C|A.\text{not-}C)$$

(where $Pr(C|A.C)$ is the probability of *C* given the conjunction of *A* and *C*). Hence we have

$$\begin{aligned} Pr(\text{If } A \text{ then } C) &= Pr(C|A.C).Pr(C) + Pr(C|A.\text{not-}C).Pr(\text{not-}C) \\ &= 1.Pr(C) + 0.Pr(\text{not-}C) \\ &= Pr(C) \end{aligned}$$

But then, by the claim under discussion, $Pr(C) = Pr(C|A)$. This is a 'reductio', for in general the probability of *C* is not independent of that of *A*. (This is the essence of the simplest of the proofs Lewis offered. For the substantial developments see Lewis (1986).)

Many respond to this proof by holding that indicative conditionals do not have truth-conditions at all;they only have assertion or acceptance conditions. This theory undoubtedly has its attractions but faces two problems. What

should be said about the powerful intuition that a conditional with a true antecedent and a false consequent is false? And how should the relevant notion of assertibility be elucidated? Not in terms of likelihood of truth, obviously.

An alternative strategy, called the supplemented equivalence theory, is to return to the equivalence thesis and argue that there is a convention governing the assertion of ‘If *A* then *C*’ to the effect that it should only be asserted when it would be right to infer *C* on learning *A*. This convention is like that governing the use of ‘but’. ‘*A* but *C*’ has the same truth-conditions as ‘*A* and *C*’, but the use of the former conventionally implicates, in H.P. Grice’s terminology, a contrast (see Grice 1975; Implicature). Likewise, runs the suggestion, ‘If *A* then *C*’ has the same truth-conditions as ‘ $A \supset C$’ but its use carries the implicature that my reasons for ‘ $A \supset C$’ are such that it would be right, on learning *A*, to infer *C* (that is, to use *modus ponens*). Now that will be the case just if the probability of ‘ $A \supset C$’ would not be unduly diminished on learning that *A* is true - otherwise it would not then be available as a probably true premise to combine with *A* on the way to inferring *C*. It follows that it will be right to assert ‘If *A* then *C*’ to the extent that (1) ‘ $A \supset C$’ is probable, and (2) ‘ $A \supset C$’ is probable given *A*. It is an elementary exercise in probability theory to show that this two-fold condition is satisfied to the extent that $Pr(C|A)$ is high. The supplemented equivalence theory therefore explains the assertibility condition noted by Adams.

What do supplemented equivalence theorists say about our earlier example ‘If I live in London, then I live in Scotland’, which comes out true on the equivalence theory and so on the supplemented equivalence theory? They say that it seems false not because it is false but because it has very low assertibility - *Pr*(I live in Scotland/I live in London) = 0 - and in general that our intuitions about truth and validity of inferences involving indicative conditionals are governed by responses to assertibility rather than truth.

Warning: almost everything about indicative conditionals is controversial, including whether they are well labelled by the term ‘indicative’, and some even deny the validity of *modus ponens*!

Indirect discourse

Indirect discourse is a mode of speech-reporting whereby a speaker conveys the content of someone's utterance without quoting the actual words. Thus, if Pierre says, 'Paris est belle', an English speaker might truly say,

(1) Pierre said that Paris is beautiful.

In English, sentences of indirect discourse often have the form 'A said that s', where 'A' refers to a person and 's' is often called the 'content sentence' of the report.

Sentences of indirect discourse have been classed with attributions of belief (and other psychological states) in view of an apparent conflict with the 'principle of the intersubstitutability of coreferring terms', which states that the truth-value of a sentence does not alter if one term in a sentence is replaced with another referring to the same thing. If (1) is true and 'Paris' and 'the City of Light' refer to the same thing, (2) may still be false:

(2) Pierre said that the City of Light is beautiful.

1 Frege's theory

In 'indirect discourse' a speaker reports someone's utterance without quoting the actual words used (often using the form '*A* said that *s*'). Sentences of indirect discourse give rise to an apparent conflict with the 'principle of the intersubstitutability of coreferring terms', which states that the truth-value of a sentence does not alter if one term is replaced with another which refers to the same thing. Gottlob Frege (1892) put forward an important theory to deal with this problem. He proposed that 'said' alters what the words in the 'content sentence' ('*s*' above) refer to. For example, consider the following statements:

(1) Pierre said that Paris is beautiful.
(2) Pierre said that the City of Light is beautiful.

'Paris' and 'the City of Light' both usually refer to the actual city, Paris. The phrase 'is beautiful' usually refers to the set of beautiful things. But when words appear after the phrase 'said that', they refer to the meanings they normally express - which Frege called their 'senses' - which are not the same as their referents (see Frege, G. §3).

The sense of an expression is a 'mode of presentation' of its referent. The sense associated with 'the City of Light' presents Paris in a particular way: as the City of Light. To understand an expression is to grasp its sense (see Sense and reference). Frege called the sense of a sentence a 'thought'. To have a propositional attitude is to stand in a certain relation to a thought. For example, to believe that Paris is beautiful is to stand in the believing relation to the thought that Paris is beautiful. Frege claimed that senses and thoughts are not psychological, mind-dependent things, but rather are Platonic, abstract objects. If two people believe that Paris is beautiful, then it is the very same thought that they both have. And this thought would exist even if there had been no minds (see Frege, G. §4).

The Fregean theory explains away the apparent failures of intersubstitution: the 'senses' of 'Paris' and 'the City of Light' are different. Hence the words refer to different things in (1) and (2) and so no violation of the substitution principle occurs.

2 Davidson's theory

Donald Davidson (1968/69) has provided a very different account of indirect discourse. Davidson proposed that, at the level of logical form (see Logical form), the analysis of speech reports should be composed of two separate sentences, the first ending in the demonstrative pronoun 'that'. The analysis of (1) above would then be:

(3) Pierre said that. Paris is beautiful.

On Davidson's theory the two sentences are logically distinct (not connected by any logical particle, such as 'and'). However, on specific occasions of use the demonstrative 'that' ending the first sentence refers to the reporter's utterance of the second.

According to this theory, the direct object of the verb 'said' is the reporter's own token utterance. So, suppose that

someone, *A*, utters (1). This speech act is composed of two token utterances: one of ‘Pierre said that’ and one of ‘Paris is beautiful’. Call this latter utterance ‘*U*’. Then, what Pierre would be reported as saying is *U*.

This feature is surprising, since it does not seem that Pierre could have said *U* (the reporter’s utterance) itself. But Davidson provides an account of what ‘said’ means which addresses the difficulty. He introduces the notion of ‘samesaying’: roughly, two individuals are samesayers if and only if they produce utterances which have relevantly similar semantic contents. Davidson has provided a general theory of meaning and interpretation which underwrites his appeal to semantic contents in this context (1984). We are then to understand (1) along the following lines:

(4) There was some utterance, *u*, of Pierre’s, and *u* and my next utterance make us samesayers. Paris is beautiful.

The idea is that the relation expressed by ‘said’ in *A*’s utterance of (1) can be understood in terms of the more complex relation spelled out in (4). But (4) is not intended to be any part of a technical semantic theory. It is just an informal, extra-theoretic guide to readers to help them understand the theory. In a semantic theory in Davidson’s style (see Davidson, D. §4), the axiom for ‘said’ might be:

(5) (*x*)(*y*)(‘said’ is true of $\langle x, y\rangle$ iff *x* said *y*).

The point is that since ‘said’ is supposed to relate reportees to utterances of reporters, some informal explanation of this saying relation is required. (4) provides this explanation.

Davidson’s theory explains the apparent failures of substitution such as that illustrated by (1) and (2). In an utterance of (1) the main verb is ‘said’ and its syntactic object is the demonstrative ‘that’. The ensuing utterance of ‘Paris is beautiful’ only serves as a referent for the demonstrative. It is not in any other way a semantically relevant component of the report. An utterance of (1) and an utterance of (2) resemble each other in that each has the form ‘Pierre said that’. But the referents of the two instances of ‘that’ are different utterances. So (1) does not entail (2). No violation of the intersubstitutability of coreferring terms occurs. The latter principle still applies to the content sentences of (1) and (2):

(6) Paris is beautiful.
(7) The City of Light is beautiful.

(6) does entail (7), given the coreference of ‘Paris’ and ‘the City of Light’. But this has no direct bearing on the logical relations between (1) and (2).

Davidson’s theory differs importantly from Frege’s. The former does not entail any shifts of reference for the words in the content sentence, which has exactly the same semantic features as it would have if uttered in isolation. This feature of the theory implements a natural and elegant idea of how speech reporting works. When *A* reports on the speech of *B*, *A* produces a new sentence, *S*, as content sentence of the report. *S* in *A* ’s mouth expresses the content of *B*’s speech act. The utterance of *S* then serves as a model of *B*’s original speech act. And this exhausts its role.

Various objections have been made to Davidson’s proposal. Only two are discussed here. The first objection is due to Tyler Burge (1986). Burge points out that on Davidson’s theory, an utterance of (8) below would be true only if there were some utterance of the reporter’s and some utterance of Pierre’s that made them samesayers:

(8) Pierre said something.

This result follows from the functioning of the word ‘said’ on the theory. But the result is wrong: I might utter (8) truly without myself ever making any utterance that would make Pierre and me samesayers. The objection is perhaps not conclusive. But Burge points out that a solution to the difficulty would be to allow the objects of speech reports to be abstract objects, rather than token utterances, and offers several further arguments that this solution is correct. It seems natural to take the relevant abstract objects to be sentence-types. If this suggestion is adopted, then Burge’s objection forces no major revisions of Davidson’s theory. The original account of ‘said’ in terms of samesaying no longer applies. But an analogous explanation of the functioning of ‘said’ remains available. Instead of understanding (1) along the lines of (4), we would understand it along the lines of:

(9) There was some sentence, *s*, which Pierre uttered, and *s* meant in Pierre's mouth then what the following means now in mine: Paris is beautiful.

The second objection is due to James Higginbotham (1986). On Davidson's account, (10) and (11) ought to have identical semantic features:

(10) Every girl said that her mother was kind.
(11) Every girl said that. Her mother was kind.

This is because (11) merely makes explicit the analysis that Davidson would attribute to (10). However, (10) and (11) are semantically distinguishable. (10) is ambiguous: on the first reading, (10) would be true if and only if each girl said of some specific contextually indicated person, *x*, that *x*'s mother was kind; on the second reading, it would be true if and only if each girl said that her own mother was kind. But (11) is only subject to the first reading. This objection shows that Davidson's theory is not correct as it stands, and will have to modified in very serious ways if it is to accommodate interactions between words inside and outside content sentences.

Induction, epistemic issues in

Consider the following:

(1) Emeralds have been regularly dug up and observed for centuries; while there are still emeralds yet to be observed, every one observed so far has been green.

It is easy to see why we regard (1) as evidence, if true, that:

(2) Every emerald observed up until 100 years ago was green.

(1) logically implies (2): there is no way (1) could be true without (2) being true as well. It is less easy to see why we should think that (1), if true, is any evidence at all that:

(3) All hitherto unobserved emeralds are green as well.

(1) does not logically imply (3): it is consistent with (1) that (3) be false - that the string of exclusively green emeralds is about to come to an end. None the less, we do *regard (1) as evidence, if true, that (3). What, if anything, justifies our doing so?*

To answer this question would be to take a first step towards solving what is known as the 'problem of induction'. But only a first step. There is, at least on the surface, a wide variety of arguments that share the salient features of the argument from (1) to (3): their premises do not logically imply their conclusions, yet we think that their premises, if true, constitute at least some evidence that their conclusions are true. A fully fledged solution to the problem of induction would have to tell us, for each of these arguments, what justifies our regarding its premises as evidence that its conclusion is true. Still, the question as to how this step might be taken has been the focus of intense philosophical scrutiny, and the approaches outlined in this entry have been among the most important.

1 The presupposition approach

Considering the above, one proposal that leaps immediately to mind is that what justifies our regarding (1) as evidence that (3) is that we presuppose that the world is so constructed that observed samples are representative of the populations from which they are drawn - in Hume's words, that 'the future is conformable to the past' or (as others have put it) that 'nature is uniform' (see Hume, D. §2). We can express the presupposition thus (where *F* and *G* are any predicates):

(4) Whenever at least some *F*s are observed and *n* per cent of all the *F*s observed are *G*, *n* per cent of the remaining *F*s are *G*.

Given this presupposition, it is no more difficult to see why we should regard (1) as evidence that (3) than it is to see why we should regard (1) as evidence that (2): the conjunction of (1) and (4) logically implies (3). But there are three problems.

(a) *(1) and (4) imply too much*. Let us say that an object is *grue* just if *either* it has been observed by now and is green *or* it has yet to be observed and is blue. By this definition, (1) logically implies that:

(5) Emeralds have been regularly dug up and observed for centuries; while there are still emeralds yet to be observed, every one observed so far has been grue.

And, just as (1) and (4) logically imply (3), so (5) and (4) logically imply:

(6) All the hitherto unobserved emeralds are grue as well.

Thus (1) and (4) logically imply *both* (3) and (6). But, given that there are emeralds yet to be observed, (6) is incompatible with (3): unobserved emeralds that are grue are, by definition, blue. Now, the predicate 'grue' seems so obviously jerry-rigged for the occasion that it looks easy to circumvent the difficulty just described. Simply distinguish between jerry-rigged predicates and the rest - between *unprojectible* predicates and *projectible* ones - and say that what we presuppose is that observed samples are representative, *with respect to projectible predicates*,

of the populations from which they are drawn. That is:

(4′) Where *F* and *G* are projectible, whenever at least some *F*s are observed and *n* per cent of all the *F*s observed are *G*, *n* per cent of the remaining *F*s are *G*.

But only in concert with a premise asserting that ‘emerald’ and ‘green’ are projectible predicates and ‘grue’ is not, will this modification work. On pain of being entirely *ad hoc* this premise would need the support of some principled way of distinguishing between projectible and unprojectible predicates - something that has proved extremely elusive. This much, however, is worth noting. The problem just outlined (known as the ‘new riddle of induction’ - see Goodman, N. §3) is not peculiar to the presupposition approach: it is a problem that any non-sceptical approach to the problem of induction will also have to solve.

(b) *Observed samples are not, as a matter of fact, always representative of the populations from which they are drawn*. This is particularly common with small samples, but can and does occur even with large ones; nature sometimes throws us a curve. Most of this difficulty can be circumvented by moving to a yet more modest version of (4). For example, we can say that what we presuppose is that the world is so constructed that observed samples are *usually* representative of the populations from which they are drawn, that:

(4″) Where *F* and *G* are projectible, it is typically the case that when at least some *F*s are observed and n per cent of all the *F*s observed are *G*, *n* per cent of the remaining *F*s are *G*.

Of course, (1) and (4″) do not logically imply (3). But it is open to us to claim that what justifies our regarding (1) as evidence that (3) is that, in so far as we think that (4″) is true, we think that the argument from (1) to (3) is an instance of an argument form whose instances typically have a true conclusion when the premise is true. And, while further modification would be required to allay fully the worry about small samples - (4″) does not seem very credible in a case in which only one *F* has been observed as an instance - this does not seem in principle impossible.

(c) *It is hard to see how, by the lights of the presupposition approach itself, we could be justified in believing (4″) (or (4′) suitably modified)*. (4″) makes a very strong claim about the world. (4″) says, not only that samples so far observed have typically been representative, with respect to projectible predicates, of the populations from which they are drawn, but also that samples not yet observed are typically representative in this way as well. This latter claim is just of the sort we presumably are not justified in believing except on the basis of evidence - in this case, evidence that samples so far observed typically have, indeed, been representative. But, given the justificatory scheme advanced by the presupposition approach, we cannot regard the claim that observed samples have typically been representative as evidence that unobserved samples are typically representative unless we already believe (4″). Thus it would seem that very claim to which the presupposition approach would have us appeal to justify our regarding (1) as evidence that (3), is one that both requires justification and is (given this approach) incapable of receiving any.

2 The pragmatic approach

But is it so important that we believe (4″)? Clearly, if (4″) is true then the following argument form will be reliable:

(7) At least some *F*s have been observed and *n* per cent of them have been *G* (where *F* and *G* are projectible). Therefore, *n* per cent of the remaining *F*s are also *G*.

That is, an instance of (7) will typically have a true conclusion when it has a true premise. And just as clearly, if (4″) is false, (7) will be unreliable. But, some have (in effect) suggested, if (4″) is false, then *no* competing projective argument form (no other argument form that predicts what percentage of the remaining *F*s are *G* from the percentage in the observed sample) will be reliable. More precisely, they have claimed that (for any projectible *F* and *G* where the number of *F*s is infinite) if there is a limit to the relative frequency with which observed *F*s are *G* (roughly, if there is a point in an infinite sequence of observations beyond which the percentage of observed *F*s that are *G* remains fairly stable) then the repeated use of (7) will eventually predict that relative frequency: that is, they have claimed that, in such a case, (7) will eventually find the true relative frequency if any projective

argument form will. Thus the justification for our regarding (1), if true, as evidence that (3): the argument from (1) to (3) is an instance of (7), an argument form which is (in this sense) reliable if any projective argument form is (see Reichenbach, H. §3). There are, however, the following problems:

(a) *The pragmatic approach justifies too much*. Consider the infinite number of variants of the following argument form:

(7′) At least some *F*s have been observed and *n* per cent of them have been *G* (where *F* and *G* are projectible). Therefore, $(n + f(m))$ per cent of the remaining *F*s are also *G*,

where *m* is the number of *F*s that have so far been observed and where the values of the function *f*(*m*), while non-zero up to rather large finite values of *m* (in particular, for values of *m* large enough to represent accurately the number of emeralds that have in fact thus far been observed), converge towards zero as *m* approaches infinity. No less than (7), all these argument forms will find the true relative frequency if any projective form will. Yet, among them are argument forms that have, as an instance, the inference from (1) to:

(8) Fifty per cent of the hitherto unobserved emeralds are green as well.

(Suppose that *n* is the number of emeralds that have in fact been observed and $f(m) = -\frac{1}{2}$, where $m \leq n$ and *f*(*m*) converges to zero thereafter.) We do not (indeed, it would seem positively counterinductive to) regard (1) as evidence that (8). Yet the pragmatist approach provides no justification for regarding (1) as evidence that (3) that is not readily available to justify our regarding (1) as evidence that (8).

(b) *Even were (7) the only argument form that will eventually find the true relative frequency if any projective argument form will, this could not justify our regarding (1) as evidence that (3)*. For there to be a limit to the relative frequency with which observed emeralds are green, there needs to be an infinite number of emeralds to observe. But the quantity of emeralds is, presumably, finite. Once we know there is no limit of the relative frequency, we know that (7)’s boast, that it will find the limit if there is one, is a boast which can be equally made by any argument form whatsoever. Under such circumstances, it is hard to see why we would think that the fact that inference from (1) to (3) is an instance of (7) justifies our regarding (1) as evidence that (3).

3 The inductive approach

Some have suggested another way of circumventing the third difficulty with the presupposition approach. It is not really necessary, in order for us to be justified in regarding (1) as evidence that (3), that we believe (4″). It will suffice that we believe that:

(9) (4″) is true when *F* and *G* predicate properties of physical objects.

This, of course, is not a modest claim; if (3) requires justification, then certainly (9) does as well. But (it has been argued) that justification is readily available from the fact that instances of (7) employing the sort of predicates described in (9) (call these *type 1 instances of (7)*) have been observed to be reliable in the past, and from our belief that:

(10) (4″) is true when *F* and *G* predicate properties of type 1 instances of (7).

And, since (9) and (10) are logically independent, no begging of the question is involved when we appeal to our belief in (10) to justify our belief in (9).

Of course, (10) itself stands as much in need of justification as (9) did. But this, too, is available in so far as we have observed that instances of (7) employing predicable expressions of the sort described in (10) (call these *type 2 instances of (7)*) have been reliable in the past and in so far as we believe that:

(11) (4″) is true when *F* and *G* predicate properties of type 2 instances of (7).

This justification, again, begs no question. And, by appeal to the track record of instances of the sort described in (11) and to the truth of (4″) when *F* and *G* predicate properties of such instances, (11) can in turn be justified. The sequence of ever higher-level justification can be extended indefinitely. But then there are the following

difficulties:

(a) *The proposed justification can never be produced, since it involves an infinite regress of justifying beliefs*. To that extent, the inductive approach would seem to exchange the defect of circularity for another defect just as serious.
(b) *We can just as easily justify regarding (1) as evidence that not-(3)*. Modify (4″) so that it reads, '*It is not the case that n* per cent of the remaining *F*s are *G*'; modify (7) so that its conclusion reads, '*It is not the case that n* per cent of the remaining *F*s are also *G*'. Call the results (4″)* and (7)* respectively. Substitute (4″)* for (4″) and (7)* for (7) in the foregoing, and what you get is every bit as good a justification for regarding (1) as evidence that not-(3). But (1) presumably can not be at the same time evidence that (3) *and* evidence that not-(3).

4 The probabilist approach

This approach differs from those so far canvassed in that, while it also seeks to show how we can be justified in regarding one hypothesis as evidence for the truth of another when the first does not logically imply the second, it does not rely on any appeal to (4″) or the reliability of (7). It appeals instead to the propriety of probabilism.

Probabilism is the view that (a) confidence comes in degrees, and (b) where *Z* is any set of hypotheses closed under truth-functional operations, your degree of confidence assignment to the hypotheses in *Z* (a measure of how confident you are in the truth of each of the hypotheses in *Z*) is open to rational criticism if it fails to satisfy the following axioms of probability: for any propositions *P* and *Q* in *Z*, (i) $\mathrm{prob}(P) \geq 0$; (ii) if *P* is a tautology, $\mathrm{prob}(P) = 1$; (iii) if *P* and *Q* are logically incompatible,

$$\mathrm{prob}(P \vee Q) = \mathrm{prob}(P) + \mathrm{prob}(Q)$$

Suppose you have a degree of confidence assignment to the hypotheses in some such *Z*, where that assignment satisfies the foregoing axioms. For any hypotheses *P* and *Q* in *Z*, let us define your personal odds for *P* as against *Q* as just the ratio your degree of confidence in *P* bears to your degree of confidence in *Q*. Since your degree of confidence that *P* and your degree of confidence that not-*P* must sum to 1 (if they are to satisfy the Kolmogorov axioms), the greater your personal odds are for *P* as against not-*P*, the more confident you are that *P*.

Suppose, now, that for some *P* and *Q* in *Z* of whose truth values you are uncertain, your personal odds for $P \,\&\, Q$ as against $\text{not-}P \,\&\, Q$ are greater than your personal odds for *P* as against not-*P* - that is, your personal odds for *P* as against not-*P* are greater given *Q* than they are otherwise. Then, probabilists hold, you must surely be counted as regarding *Q* as a positive indication that *P* - as a hypothesis that (if true) is evidence that *P*. But if so, it is possible for us to say how we can be justified in regarding (1) as evidence that the conjunction of (1) and (3) is true - even though (1) does not logically imply that conjunction. It suffices that the conjunction logically implies (1). That is because, if *P* logically implies *Q*, then, so long as your degree of confidence assignment satisfies the foregoing axioms and you are certain neither of the truth-value of *P* nor of the truth-value of *Q*, your personal odds for $P \,\&\, Q$ as against $\text{not-}P \,\&\, Q$ must be greater than your personal odds for *P* as against not-*P* - you must regard *Q* as evidence that *P* (see Probability theory and epistemology). But, again, there are difficulties.

(a) *Probabilism, and its doctrine about the relation between personal odds and the assessment of evidential relevance, are controversial*. Critics have argued that confidence does not (nor is there epistemic reason why it should) always come in degrees; that there are difficulties both with the doctrine that degrees of confidence are open to criticism if they do not satisfy the foregoing axioms and with the arguments probabilists have offered in support of that doctrine; that the probabilist's account of the relation between personal odds and assessments of evidential relevance has counterintuitive consequences. Probabilists have powerful responses to all these criticisms (and, indeed, the proliferation of more modest variants of probabilism that do not presuppose that we have, or ought to have, precise degrees of confidence has rendered the first criticism moot), but not everyone is convinced.
(b) *Since (1) is logically implied by the conjunction of (5) and (6), probabilism requires us to regard (1) as evidence that this conjunction - which is equivalent to the claim that all emeralds are grue - is true*. Not that this is obviously a mistake. After all, given (1), both the conjunction of (1) and (3) and the conjunction of (5) and (6) are guaranteed to be right about the emeralds already observed; otherwise they are not. But it does indicate that only because the truth of (1) forecloses the possibility that these conjunctions are wrong about the emeralds that have already been observed are we bound to regard (1) as evidence in favour of the conjunctions. What colour the conjunctions attribute to the emeralds that are still unobserved has nothing to do with it.

(c) *Probabilism does not justify our regarding (1) as evidence that (3)*. (3) does not logically imply (1). So, even granting the propriety of what probabilists say about evidence (that is, even granting that probabilists have succeeded in showing how we can in some cases be justified in regarding one hypothesis as evidence for another it does not logically imply - no mean feat), probabilism provides no justification for regarding (1) as evidence that (3).

5 The reflective-equilibrium approach

The reflective-equilibrium approach, like the probabilist one, also renounces any appeal to (4″). Advocates of this approach argue that the only way to go about justifying our regarding (1) as evidence that (3), is to appeal to some argument form such as (7). But, convinced that there is no cogent non-question-begging way to argue for the reliability of such an argument form, the advocates of the reflective-equilibrium approach hold that the best we can do to justify our appeal to the argument form is to show that each of its instances is acceptable to us, that each of its instances is such that we are prepared on reflection to regard its premise as evidence that its conclusion is true. That is, the best we can do to justify our regarding (1) as evidence that (3) is to show that the inference from (1) to (3) is an instance of an argument form with respect to which we are in *reflective equilibrium*. But there are the following worries:

(a) *There is nothing in the procedure for achieving reflective equilibrium with respect to an argument form that offers even the slightest guarantee that the argument form is not (unknown to us) entirely fallacious*. Consider a person who regards this coin's landing tails on the first ten tosses as evidence that it will land heads on the next. This person is, of course, quite mistaken. If the coin is fair, its performance on its first ten tosses is no evidence at all of how it will perform on the eleventh: the outcomes of the tosses are independent. But the fact that this person is mistaken is entirely compatible with their being able to achieve reflective equilibrium with respect to the following (fallacious) argument form:

(12) *C* is a fair coin that has landed heads on its first ten tosses.
Therefore, *C* will land tails on its eleventh toss.

The procedure for achieving reflective equilibrium with respect to an argument does not guarantee that the form is not fallacious - only that those who have achieved this reflective equilibrium do not *regard* the form as fallacious. It would thus be disappointing if the best we can do to justify our regarding (1) as evidence that (3) is to engage in such a procedure. One would have hoped we could do (and one might even think a true justification would require us to do) something better.

(b) *Achieving reflective equilibrium requires too much*. The task of furnishing the sort of justification called for by the reflective-equilibrium approach is an extremely ambitious one, involving the crafting of an argument form (of which the argument from (1) to (3) is an instance) that can survive an extensive test of its adequacy to our intuitions about its instances. A fully adequate argument form has yet to be articulated. But if this task of justification is thus not one we have yet actually accomplished, then whatever it is that justifies our regarding (1) as evidence that (3), it cannot be that we have placed our so regarding (1) in reflective equilibrium with an argument form and its instances. We have done no such thing.

6 The naturalist approach

All the approaches canvassed so far assume that what justifies our regarding (1) as evidence that (3) is that there is available to us some sort of argument in favour of the claim that (1) is evidence that (3). But to some philosophers, this idea seems misguided. Humans constitute just one species of creatures whose survival depends upon their following inductive practices. The rest of these species are quite incapable of understanding *any* argument in support of such practices; no arguments are available to *them*. Yet (these philosophers maintain) it still seems perfectly appropriate to say of a dog that it is justified in regarding its master's picking up its leash as evidence that it is about to go for a walk. Thus (they conclude) the availability of argument is not necessary for justification: to the dog, there is no argument available.

Nor (they continue) does the mere availability of argument seem sufficient for justification. Consider a person who sets no store by our canons of good argument and only regards (1) as evidence that (3) because they like the sound

of the utterance, '(1) is evidence that (3)'. It is compatible with this that there is just as good an argument available to them as there is to you or me for regarding (1) as evidence that (3). But surely (these philosophers maintain), given that they set no store by that argument, we can hardly want to call their regarding (1) as evidence that (3) *justified*.

What qualifies the dog's state of opinion as justified, but not the person's, has nothing to do with the availability of argument; it has to do, instead, with what caused their respective states of opinion. Whether a state of opinion is justified is determined entirely by features of the process that is causally responsible for being in that state - for example, the features (such as reliability in producing true beliefs) that make these processes conducive to our survival. What the holder of the state of opinion is in a position to *say* about the features of the process that causes their belief is, in general, beside the point (see Reliabilism; Internalism and externalism in epistemology). But, again, there are worries.

(a) *The claim that being able to offer a justification for one's opinion is neither necessary nor sufficient to render the opinion justified is difficult to square with our practice*. Were the claim true, it is hard to see why we would care in the least whether we could offer even the most meagre justification for any of our beliefs.
(b) *If it is the aetiology of our opinions that determines whether they are justified, then we are ill-placed to tell, with respect to most of them, why they are worth holding*. We are not usually in any position to say by exactly what processes our opinions have been caused - consider, for example, beliefs in theories, beliefs held since childhood - let alone whether the processes that have caused them possess whatever features are necessary and sufficient for them to confer justification on the beliefs they produce. But, if so, by the lights of the naturalist approach it would seem that we are usually in no position to say that our opinions are justified - that they are any more worth holding than those we would acquire by reading tea leaves.

7 The meaning approach

All the foregoing approaches presuppose that our regarding (1) as evidence that (3) *requires* some substantive justification. But not all philosophers think that this is so. Some have argued that no justification is called for: it is simply part of what we *mean* by 'evidence' that (1) constitutes evidence that (3). This approach has some difficulties:

(a) *To use a meaning claim in this way seems dogmatic*. In the wake of work (by Quine and others) to the effect that there is no bona fide distinction to be drawn between true claims that are true by virtue of meaning and those that are not (see Analyticity), this attempt to settle an apparently open question by appeal to meaning claims looks to be just a form of dogmatism.
(b) *The meaning claim, even if granted, is ineffective*. It may well be that, for at least some people, it is part of what they mean by 'evidence' that the failure of a fair coin to land heads on one toss is evidence that it will land heads on the next one. But that can hardly show that they are justified in regarding the coin's having landed tails the first time as evidence that it will land heads the next. And, if so, the fact (if it is a fact) that it is part of what *we* mean by 'evidence' that (1) constitutes evidence that (3) cannot show that *we* are justified in regarding (1) as evidence that (3).

8 The ordinary-language approach

But, to some, there is still something perverse in the claim that our regarding (1) as evidence that (3) requires justification. To say that an opinion is one that requires justification is to say that it is an opinion that a person ought not to hold unless they can produce justification. But we cannot seriously mean that until they can successfully produce the requisite justification for so regarding (1), a person should not regard (1) as evidence that (3). This is a condition that no ordinary person - and possibly no philosopher - can satisfy. Anyone who insisted upon its being met - anyone who habitually demanded of any person who asserts that (1) is evidence that (3) that they either justify that claim or withdraw it - would rightly be counted as mad. But there is the following problem:

The ordinary-language approach appears to mistake the context in which we mean to be saying that our so regarding (1) requires justification. Granted, in an ordinary context, it would indeed be perverse to say of a person who regarding (1) as evidence that (3), that their so regarding (1) requires justification. But it does not follow that it is a perverse thing to say when our purposes are philosophical - that is, when we are in the context of

philosophical inquiry. Yet, it is precisely for such purposes, and in such a context, that we mean to be asking what, if anything, justifies our regarding (1) as evidence that (3). It is precisely for such purposes, and in such a context, that we mean to be saying that our so regarding (1) requires justification.

9 The Wittgensteinian approach

Of course, this reply to the advocates of the ordinary-language approach presupposes that language can be freely wrested from the ordinary context in which it is used and thrust into a philosophical context without cost. But some (and Wittgenstein in particular) have argued that it cannot.

To appreciate how their reasoning might apply to the case at hand, suppose we say, with the critics of the ordinary-language approach, that, while our regarding (1) as evidence that (3) requires no justification for ordinary purposes in an ordinary context, it does require justification for philosophical purposes in a philosophical context. How are we to tell whether an adequate justification has been produced? For example, are justifications that contain circular arguments or infinite regresses admissible? Were we free to consult the standards of justification we employ in ordinary circumstances, we could easily see that the answer to this last question is ‘no’. But we are not. The whole point of our reply to the advocates of the ordinary-language approach is to say that those standards of justification - and their verdict that our regarding (1) as evidence that (3) does not require justification - are to be set aside in a philosophical context. But what other standards do we have? None.

We are thus faced with a dilemma. The standards of justification we employ in ordinary contexts forbid us to say that our regarding (1) as evidence that (3) requires justification. But if we turn our backs on the standards of justification we use in ordinary contexts, as it is imagined we do in the philosophical context, we deprive ourselves of any source of insight into what would *count* as justifying our regarding (1) as evidence that (3). What sustains philosophical attempts to say what justifies our regarding (1) as evidence that (3) thus looks like nothing more than a failure to face up to this dilemma. There is one major difficulty:

Wittgensteinian doctrines are very controversial. This is all the more true for the fact that the morals drawn from them so often place apparently respectable philosophical enterprises in a poor light. In this case, it may be difficult to see how a sophisticated, orderly philosophical inquiry of more than two centuries’ duration could possibly be the intellectual sham the advocates of the Wittgensteinian approach make it appear. Of course, it is part and parcel of Wittgensteinian doctrine that one cannot expect those who have toiled in the philosophical enterprise criticized to find it easy to see, even once it is pointed out to them, the way in which that enterprise is fundamentally ill-conceived: language bewitches us. But this consideration has done little to convince the many philosophers who (rightly or wrongly) see Wittgensteinian approaches to philosophical problems (such as this one) as fundamentally anti-philosophical, as attempts to hold philosophy to such standards as would make philosophy impossible.

Inductive definitions and proofs

An inductive definition *of a predicate R characterizes the Rs as the smallest class which satisfies a* basis clause *of the form* $(\beta(x) \rightarrow Rx)$*, telling us that certain things satisfy* R, *together with one or more* closure clauses *of the form* $(\Phi(x, R) \rightarrow Rx)$*, which tell us that, if certain other things satisfy R, x satisfies R as well. 'Smallest' here means that the class of* Rs *is included in every other class which satisfies the basis and closure clauses.*

Inductive definitions are useful because of inductive proofs. To show that every R has property P, show that the class of Rs that have P satisfies the basis and closure clauses.

The closure clauses tell us that if certain things satisfy R, x satisfies R as well. Thus satisfaction of the condition $\Phi(x, R)$ *should be ensured by positive information to the effect that certain things satisfy R, and not also require negative informative that certain things fail to satisfy R. In other words, the condition* $\Phi(x, R)$ *should be* monotone*, so that, if* $R \subseteq S$ *and* $\Phi(x, R)$*, then* $\Phi(x, S)$*; otherwise, we would have no assurance of the existence of a smallest class satisfying the basis and closure conditions.*

While inductive definitions can take many forms, they have been studied most usefully in the special case in which the basis and closure clauses are formulated within the predicate calculus. Initiated by Yiannis Moschovakis, the study of such definitions has yielded an especially rich and elegant theory.

1 Inductive definitions in general

Inductive definitions occur throughout mathematics. For example, one aspect of the reduction of classical mathematics to set theory has been to treat natural numbers as sets, identifying a natural number with the set of its predecessors, so that they comprise the smallest class such that:

$\emptyset$ is a natural number
If $x = y \cup \{y\}$, for some natural number *y*, *x* is a natural number.

Having this inductive definition, we can give proofs by *mathematical induction*. To show that every number has property *P*, show that $\emptyset$ has the property and that, if *y* is a natural number with property *P*, so is $y \cup \{y\}$.

One inductive definition begets others. We define 'is a sum of' as the smallest ternary relation such that:

If *x* is a natural number, *x* is a sum of *x* and $\emptyset$.
If *u* is a sum of *y* and *v*, $x = u \cup \{u\}$ and $z = v \cup \{v\}$, then *x* is a sum of *y* and *z*.

An inductive proof shows that this stipulation uniquely determines a binary operation on the natural numbers.

We can extend arithmetical methods beyond the finite, identifying a limit ordinal with the set of its predecessors, so that the ordinals are the smallest class such that:

$\emptyset$ is an ordinal.
If $x = y \cup \{y\}$, for some ordinal *y*, then *x* is an ordinal.
If the set *x* is a union of ordinals, *x* is an ordinal.

Again one inductive definition leads to another. Given a function *G*, to define a function *F* on the ordinals such that:

$F(\alpha) = G(\alpha, F \mid \alpha)$

(where $F \mid \alpha = \{< \beta, F(\beta) >: \beta < \alpha\}$), take the smallest class of ordered pairs such that:

$< 0, G(0, \emptyset) >$ is in *F*.
If *h* is a function defined on the ordinals $< \alpha$ such that $< \beta, h \mid \beta >$ is in *F*, for each $\beta < \alpha$, then $G(\alpha, h)$ is in *F*.

Speaking abstractly, an inductive definition describes the smallest relation such that:

If $\beta(x_1, \ldots, x_n)$, then $Rx_1 \ldots, x_n$.
If $\Phi_1(x_1, \ldots, x_n, R)$, then $Rx_1 \ldots x_n$.
. . . .
If $\Phi_m(x_1, \ldots, x_n, R)$, then $Rx_1 \ldots x_n$.

Here β is an *n*-ary relation, and the conditions $\Phi_1, \ldots, \Phi_m$ are monotone relations between *n*-tuples and *n*-ary relations.

Since the disjunction of two monotone conditions is a monotone condition, we can consolidate the basis and inductive clauses thus:

If $\beta(x_1, \ldots, x_n)$ or $\Phi_1(x_1, \ldots, x_n, R)$ or ... or $\Phi_m(x_1, \ldots, x_n, R)$, then $Rx_1, \ldots, x_n$.

Consequently, there will be no loss of generality if we only consider inductive definitions that describe the smallest class such that:

If $\Phi(x_1, \ldots, x_n, R)$, then $Rx_1, \ldots, x_n$,

where Φ is monotone.

Setting the example of the ordinals aside, let us restrict our attention to situations in which there is some set *A* such that, for each $x_1, \ldots, x_n$ and *S*, if $\Phi_1(x_1, \ldots, x_n, S)$, then each $x_i \in A$. Then, we shall not have to be concerned about the existence conditions for proper classes.

It is only because of the requirement that Φ is monotone that we can be confident that there is a smallest class which satisfies the closure clause, as we can see if we try to find the smallest class such that:

If either $x = 0$ and $\neg R1$ or $x = 1$ and $\neg R0$, then Rx.

Because of the monotony requirement, however, the intersection of all the sets which satisfy the closure clause satisfies the closure clause. It also satisfies the converse of the closure clause, so that (setting $n = 1$):

$(\forall x)(Rx \leftrightarrow \Phi(x, R))$.

We have inductive proofs: if we know $(\forall x)((Rx \wedge \Phi(x, P)) \rightarrow Px)$, we can conclude $(\forall x)(Rx \rightarrow Px)$.

Inductively defined classes are naturally arrayed in a well-ordered sequence of layers, for we can define the level of a member of *R* to be the number of applications of the closure clause that are needed to capture it. More precisely, we define, for each ordinal α, R_α to be $\{x{:}\, \Phi(x, \cup_{\beta<\alpha} R_\beta)\}$. Then the R_αs form a nonstrictly increasing sequence (that is, if $\beta < \alpha$, then $R_\beta \subseteq R_\alpha$); their union is *R*. Because we have stipulated that the R_αs are all contained within a set *A*, the sequence cannot be strictly increasing, since, if each R_α introduced new members of *R*, there would be as many members of *R* as there are ordinals. Consequently, there must exist an ordinal α with cardinality at most the cardinality of *A* such that $R_\alpha = R_{\alpha+1} = R$. The least such α is the *height* of the inductive definition.

2 First-order positive inductive definitions

An occurrence of a predicate *R* in a formula of the predicate calculus without '$\rightarrow$' or '$\leftrightarrow$' is *positive* if it occurs within the scope of an even number of negation signs. A first-order formula $\Phi(x_1, \ldots, x_n, R)$ in which *R* occurs only positively describes a monotone condition. *First-order positive inductive definitions*, in which the antecedent of the closure clause is a first-order formula in which the defined term occurs only positively, have been extensively and fruitfully studied.

Let A be a model for a language $\mathcal{L}$ for the first-order predicate calculus, and let $\mathcal{L}_\mathrm{A}$ be the language derived from $\mathcal{L}$ by adding a new constant $\underline{a}$ for each element *a* of the universe *A* of A. Apart from the predicate being defined, our first-order positive inductive definitions will consist of symbols of $\mathcal{L}_\mathrm{A}$.

We can explicitly describe how an inductively defined set is built. Suppose *C* is inductively defined as the smallest set such that:

If $\Phi(x, R)$, then Rx.

Then *a* is in *C* if and only if $R\underline{a}$ is derivable from the axiom:

$(\forall x)(\Phi(x, R) \rightarrow Rx)$

in A-logic, that is to say, $R\underline{a}$ is derivable from the axiom together with atomic and negated atomic sentences true in A by first-order logic supplemented by the A-rule: from $\psi(\underline{a})$, for each *a* in *A*, to infer $(\forall x)\psi(x)$.

We shall restrict our attention to cases in which A is *acceptable*, that is, A contains an isomorphic copy of the natural number system and A can describe the formation of finite sequences. Acceptability of A will make it possible for $\mathcal{L}_{\mathrm{A}}$ to describe its own syntax. We also suppose that $\mathcal{L}$ is built up from a finite vocabulary. Similar but more complicated analogues to the results described here hold without these restrictions.

It turns out that, to get a satisfactory theory, we need to look, not at the separate behaviour of individual inductive definitions but at their combinations. A relation *C* is *inductively definable* (or simply *inductive*) over A if *C* can be defined in a language derived from $\mathcal{L}_{\mathrm{A}}$ by adding one or more inductively defined predicates; in the formula defining *C* the new predicates are allowed to occur only positively. More concisely, *C* is inductively definable over A if and only if there exist an $n + m$-ary relation *D* and members $b_1, \ldots, b_m$ of the universe *A* of A such that *D* is defined by a first-order positive inductive definition and *C* is equal to $< a_1, \ldots, a_n >: < a_1, \ldots, a_n, b_1 \ldots, b_m > \in D$. Showing this equivalence is a matter of seeing how several inductive definitions can be consolidated.

An inductively defined set whose complement is also inductively defined is *hyperelementary*.

A set *C* is inductive if and only if there is a finitely axiomatized theory Δ and formula $\psi(x)$ in a language extending $\mathcal{L}_{\mathrm{A}}$ such that, for any *a*, *a* is an element of *C* if and only if $\psi(\underline{a})$ is derivable from Δ in A-logic. Just in case *C* is hyperelementary, we can arrange things so that, if *a* is in *C* then $\psi(\underline{a})$ is derivable from Δ, whereas if *a* is not in *C*, $\neg\psi(\underline{a})$ is derivable.

The results cited in the last paragraph would also obtain if the word 'inductive' were replaced by 'recursively enumerable', 'hyperelementary' by 'recursive' and 'derivable in A-logic' by 'derivable in first-order logic'. This observation illustrates a far-reaching analogy between structural properties of inductively definable and recursively enumerable sets.

Another example is the following: inductive sets, like recursively enumerable sets, enjoy the *reduction property*, that is, for any inductive sets *B* and *C*, there exist nonoverlapping inductive sets $B' \subseteq B$ and $C' \subseteq C$ with $B' \cup C' = B \cup C$. We get them by comparing the stages in the relevant inductive definitions at which the members of *B* and *C* are introduced, putting a member of $B \cap C$ into B' just in case it is put into *B* before being placed into *C*.

Again, there are inductively defined sets *C* which are *complete*, meaning that, for each inductive set *D*, there is a hyperelementary function *F* such that, for any *a*, $a \in D$ if and only if $F(a) \in C$. The best-known complete set, at least among philosophers, is the minimal fixed point of Saul Kripke's theory of truth. The theory of truth is robust enough to encode every inductive definition.

There is a version of the recursion theorem for inductive sets. Also, one can do priority arguments (see Sacks 1990).

The height of the monotone operator which generates an inductively defined set is a measure of the complexity of the set. Indeed, the principal ideas of the theory of inductive sets originate in S.C. Kleene's investigations of how to extend the arithmetical hierarchy into the transfinite. The *order* of A, $o(\mathrm{A})$, is the supremum of the heights of all first-order positive inductive definitions over A. This supremum is reached by the complete inductive sets, among others. A subset of *A* is hyperelementary if and only if it is defined by a first-order positive inductive definition whose height is less than $o(\mathrm{A})$.

3 $\prod_1^1$ and inductively defined sets

An element *a* of *A* will be in the smallest class which satisfies the closure clause $(\Phi(x, R) \rightarrow Rx)$ just in case the sentence $(\forall R)((\forall x)(\Phi(x, R \rightarrow Rx) \rightarrow R\underline{a})$ is true. It follows that every inductive set is $\prod_1^1$,that is, it is

definable by a formula consisting of initial second-order universal quantifiers followed by a first-order formula.

If *A* is countable, the converse holds. $(\forall R)\psi(R,\underline{a})$ is true if and only if the sentence $\psi(R,\underline{a})$ is a member of the smallest class of sentences which:

contains the atomic and negated atomic sentences true in A;
contains the theorems of first-order logic;
contains θ whenever it contains $(\chi \rightarrow \theta)$ and χ; and
contains $(\forall v)\chi(x)$ whenever it contains each $\chi(\underline{a})$.

Because A is acceptable, so that it can represent its own syntax, this can be written as a first-order positive inductive definition.

One proves this by proving a completeness theorem, showing that, for *A* countable, $(\forall R)\theta(R)$ is true if and only if $\theta(R)$ is derivable in A-logic.

4 Inductive and admissible sets

To get a picture of the place of inductively defined sets within the universe of set theory, we look at sets that can be built up by taking the elements of *A* as basic building blocks or *urelements*:

$V_0 = A$.
$V_{\alpha+1}$ = the set of subsets of V_α.
$V_\lambda = \cup_{\alpha<\lambda} V_\alpha$, for λ a limit.

The *constructible sets* form a subclass of the V_αs:

$L_0 = A$.
$L_{\alpha+1}$ = the set of subsets of L_α which are definable in the language derived from $\mathcal{L}_\mathrm{A}$ by adding a predicate '*U*', whose extension is *A*, a predicate '$\in$', whose extension is the elementhood relation, restricted to L_α, and names for all the members of L_α.
$L_\lambda = \cup_{\alpha<\lambda} L_\alpha$, for λ a limit.

We are interested in the initial stages of the constructible hierarchy. First, let us introduce a little more notation. The *bounded formulas* are those in which every universal quantifier takes the form $(\forall x)(x \in t \rightarrow \ldots)$, and every existential quantifier takes the form $(\exists x)(x \in t \wedge \ldots)$. The Σ_1 *formulas* are those obtained by prefixing one or more existential quantifiers to a bounded formula.

One can show that $L_{0(\mathrm{A})}$ constitutes the smallest set which:

(1) contains *A* and the sets definable in A;
(2) contains x, y and the union of *x* whenever it contains *x* and *y*;
(3) satisfies the universal closure of the separation axiom schema, $(\exists y)(\forall z)(z \in y \leftrightarrow (z \in x \wedge \phi(z)))$, restricted to bounded formulas ϕ; and
(4) satisfies the universal closure of $(\forall x)(x \in t \rightarrow (\exists z)\phi(x,z)) \rightarrow (\exists y)(\forall x)(x \in t \rightarrow (\exists z)(z \in y \wedge (x,z))$, for ϕ bounded.

Subsets of the class of $V_\alpha s$ which satisfy these four conditions are said to be *admissible* above A. The first-order axioms which describe, in a natural way, a well-founded set which satisfies conditions (2) through (4) are called 'KPU' (for 'Kripke-Platek set theory with urelements', after the thinkers who first studied admissible sets).

The Barwise-Moschovakis-Gandy theorem states that a subset of *A* is inductive if and only if it is definable by a Σ_1 formula on $L_{o(\mathrm{A})}$. While the proof is complicated, it is possible to give a summary. To show that every inductively definable set is Σ_1 definable on $L_{o(\mathrm{A})}$, show that, if there is a proof in A-logic of a given sentence, then such a proof exists in $L_{o(\mathrm{A})}$. For the converse, show that, if *S* is Σ_1 definable, there is a formula σ such that $a \in S$ if and only if $\sigma(\underline{a})$ is derivable from KPU in A-logic.

It follows that a set is hyperelementary over A if and only if it is an element of $L_{o(\mathrm{A})}$.

The Barwise-Moschovakis-Gandy theorem explains the parallels between recursively enumerable and inductive sets. Recursively enumerable = Σ_1 definable in the smallest set admissible above $\emptyset$. Inductive over $\mathrm{A} = \Sigma_1$ definable in the smallest set admissible above A.

Admissible sets have found widespread applications to the study of infinitary logic, but here it is possible to do no more than refer to Barwise (1975).

The results cited here are standard, and proofs can be found in Moschovakis (1974) and Barwise (1975).

Inductive inference

According to a long tradition, an inductive inference is an inference from a premise of the form 'all observed A *are* B*' to a conclusion of the form 'all* A *are* B*'. Such inferences are not deductively valid, that is, even if the premise is true it is possible that the conclusion is false, since unobserved* A*s may differ from observed ones. Nevertheless, it has been held that the premise can make it reasonable to believe the conclusion, even though it does not guarantee that the conclusion is true.*

It is now generally allowed that there are many other patterns of inference that can also provide reasonable grounds for believing their conclusions, even though their premises do not guarantee the truth of their conclusions. In current usage, it is common to call all such inferences inductive. It has been widely thought that all knowledge of matters of fact that we have not observed must be based on inductive inferences from what we have observed. In particular, all knowledge of the future is, on this view, based on induction.

1 Paradigms of induction

The inference from 'all observed *A* are *B*' to 'all *A* are *B*', which was once taken to be the pattern for all inductive inference, is called (universal) *inductive generalization* or *enumerative induction*. A standard example is the inference from all observed ravens being black to all ravens being black. The fallibility of such inference is illustrated by the fact that, although all the swans seen by Europeans of the eighteenth century were white, black swans existed in Australia.

Some writers, such as J.S. Mill, argued that inductive generalization is the only legitimate kind of induction. However, as Mill was well aware, others have thought that there are other ways of making inferences from the observed to the unobserved. One method that has played an important role in philosophy of science is the method of hypothesis. In this method, the premises are that (i) hypothesis *H* implies a proposition *E* describing observable phenomena, and (ii) *E* is observed to be true; the conclusion is that *H* is true. In modern discussions this method is often called the hypothetico-deductive method, because *E* is supposed to be deduced from the hypothesis *H*.

The method of hypothesis is not deductively valid, since false hypotheses can have true consequences. Its defenders have argued that its premises can nevertheless make it reasonable to believe its conclusion. Descartes offered an example to support this position: if we find that a message in code makes sense when for each letter we substitute the following letter (B for A, C for B, and so on), we will be practically certain that this gives the true meaning of the message, especially if the message contains many words.

The method of hypothesis licenses conclusions that can never be reached by inductive generalization. For example, from the fact that observable phenomena are as they would be if matter consists of atoms, one may infer by the method of hypothesis that matter does consist of atoms. This conclusion could be reached by inductive generalization only if one had observed instances of matter composed of atoms, something that had not been done at the time that most scientists accepted the atomic theory of matter.

Other commonly recognized types of inductive inference are: (1) *statistical inductive generalization*, in which the premise is that *x* per cent of observed *A*s have been *B* and the conclusion is that about *x* per cent of all *A*s are *B*; (2) *predictive inference*, in which the premises are that *x* per cent of observed *A*s have been *B* and that *a* is *A*, the conclusion being that *a* is *B*; (3) *direct inference*, in which the premises are that *x* per cent of all *A*s are *B* and that *a* is *A*, the conclusion being that *a* is *B*; and (4) *inference by analogy*, in which the premises are that certain individuals have properties $F_1, \ldots, F_n$ and *a* also has $F_1, \ldots F_{n-1}$, the conclusion being that *a* also has F_n.

2 Induction in practice

It is generally allowed that the cogency of an inductive inference is greater the more observations have been made and the more varied these observations have been. Mill also stressed that the reliability of an inductive generalization is greatly increased by finding that other similar generalizations hold up; conversely, he maintained that our knowledge of the variability of bird-colouring undermined the inductive generalization to the conclusion that all ravens are black. But the relevance of such considerations means that inductive inferences are not adequately represented by the paradigm forms listed above, since relevant information ought to be included in the

premises.

Even if we added to the paradigm forms the sort of information just mentioned, they would still not adequately represent the inductive inferences that are made in everyday life and in science. For example, consider the inductive generalization to the conclusion that all ravens are black. The premise was that all observed ravens have been black. But observed by whom? If we say observed by anyone, then we cannot be sure that the premise is correct, and this ought to affect our confidence in the conclusion, though the argument does not provide for that. If we say observed by me, then the premise leaves out the very relevant information of what I know from the testimony of others. Further, even when the premise is limited to my own observation, I cannot be sure it is true; I could very well have observed a white raven and mistakenly inferred from the fact that it was white that it was not a raven. Thus my confidence in the conclusion ought to depend on how closely I have examined both what I take to be ravens and what I take to be non-black things, though this is not reflected in the premise.

Another example: suppose we have weighed an object three times and obtained measurements of 4.9, 5.0 and 5.1 grams. From these results we might infer that the true weight of the object is between 4.7 and 5.3 grams. If this is to fit one of the standard forms, it will have to be the method of hypothesis. But the hypothesis that the true weight is between 4.7 and 5.3 grams does not entail that the weighings will give the results they did. In modern presentations of the hypothetico-deductive method it is commonly said that the premises include not only the hypothesis itself but also initial conditions, such as that the object was weighed three times, and auxiliary hypotheses, such as that the balance is accurate; but even with these additional premises the evidence does not follow deductively.

Since tests of hypotheses in science typically involve measurement, the preceding example is sufficient to show that science does not have much use for a method that is truly ‘hypothetico-deductive’. But if the evidence only follows from the hypothesis with some probability, then it makes a difference what that probability is, though the method of hypothesis as usually presented does not include this information in the premises. As we will see below, it also makes a difference how probable the conclusion is on competing hypotheses, another relevant consideration that is not incorporated in the premises of the method of hypothesis as standardly conceived. Finally, our background information almost always gives us at least some relevant information; for example, we usually have some approximate idea what an object should weigh, and measurements that diverge too far from this will be taken to show that the balance is faulty. If the object that was weighed at 4.9, 5.0 and 5.1 grams was a loaded truck, we will conclude that there is something seriously wrong with the measurement process. The method of hypothesis does not provide a way to incorporate such relevant information.

3 Cogency

The premises of an inductive argument may provide more or less support for the conclusion. We would like to be able to identify the factors that determine the strength of this support. Some platitudes to this effect were mentioned above, but they have several defects. In particular, despite their vagueness, they are not true in general. For example, increasing the number of *A*s that have been observed to be *B* does not always make it more probable that all *A* are *B*; thus a person who died at age 149 is a person who died before age 150, but evidence that there is such a person would *reduce* the probability that all people die before age 150. In any case, those platitudes are limited to the paradigm forms of inductive inference, which we have seen inadequate to represent actual inductive inferences. For these reasons, many contemporary theorists have looked for a more rigorous yet flexible framework for discussing the degree to which inductive premises support their conclusions. Probability theory has often been seen as providing such a framework.

Let *H* be a hypothesis and *E* some evidence. Let $\mathrm{P}(H)$ be the probability that *H* is true given the other information that we have besides *E*. Then the probability that we should give to *H* after learning *E* is the probability of *H* conditional on *E*, which we write as $\mathrm{P}(H \mid E)$. A theorem of probability, called Bayes’ theorem (see Probability, interpretations of §5), says the following (where $\bar{H}$ means *H* is false):

$$\mathrm{P}(H \mid E) = \frac{\mathrm{P}(E|H)}{\mathrm{P}(E|H)\mathrm{P}(H)+\mathrm{P}(E|\bar{H})\mathrm{P}(\bar{H})}\mathrm{P}(H)$$

We say that *E confirms H* if $\mathrm{P}(H \mid E) > \mathrm{P}(H)$. Assuming $\mathrm{P}(H) > 0$, *E* confirms *H* just in case the fraction on the right hand side of the above equation is greater than 1. Assuming $\mathrm{P}(H) < 1$, this condition will hold just in

case $\mathrm{P}(E \mid H) > \mathrm{P}(E \mid \bar{H})$. Thus for evidence to confirm a hypothesis, it is not necessary that the evidence be entailed by the hypothesis, or even that the evidence be very probable given the hypothesis. Evidence that is quite improbable supposing the hypothesis to be true will confirm that hypothesis if the evidence is even less likely on the supposition that the hypothesis is false.

Another implication of the above equation is that even if evidence *E* does strongly confirm hypothesis *H*, it does not follow that the hypothesis has a high probability of being true, for its probability given other information may be quite low; that is, $\mathrm{P}(H \mid E)/\mathrm{P}(H)$ may be large and yet $\mathrm{P}(H \mid E)$ small, because $\mathrm{P}(H)$ is small. For example, when *H* is the hypothesis that a loaded truck weighs about 5 grams, $\mathrm{P}(H)$ is infinitesimal.

Philosophers often refer to the method of hypothesis as ‘inference to the best explanation’. This terminology has the merit of recording the fact that the inference depends not just on the relation between hypothesis and evidence but also on how other hypotheses relate to the evidence. However, it is wrong to suggest that *explanation* plays a fundamental role here; what is important in the connection between evidence and hypothesis is the probability of the evidence given the hypothesis, and this probability is not a measure of the degree to which the hypothesis explains the evidence (see Explanation; Inference to the best explanation). Furthermore, the terminology misleadingly suggests that the cogency of an inference is determined by the relation between the various hypotheses and the evidence, when in fact it depends also on the prior probability of the hypotheses.

4 Inference

Inductive inference has traditionally been understood as inference in the usual sense: on the basis of premises that are categorically accepted one comes to categorically accept another statement, the conclusion. For writers such as Bacon, Whewell and Mill, this conception was unproblematic. They thought that inductive inference could provide practical certainty on substantive matters of science and everyday life, and that where such certainty was lacking we should withhold assent. However, various factors, in particular the failure of such well-supported scientific theories as Newtonian mechanics, have convinced contemporary writers that substantive inductive conclusions always have some uncertainty, the best-supported scientific theories not excepted. This presents a dilemma: either we accept only those conclusions that are certain, in which case it seems we can accept very little and there will be almost no inductive inference, or else we accept conclusions that might be wrong.

Some writers on probability and induction, notably Carnap and Jeffrey, have embraced the first horn of this dilemma. They hold that induction should be conceived, not as a process by which we pass from some accepted statements to others, but rather as a process by which we assign probabilities to various hypotheses in the light of our evidence. On this view, we ought virtually never to make inductive inferences, as these have been traditionally conceived.

This rejection of inductive inference presupposes that acceptance of a hypothesis involves treating it as if it were certainly true. Some writers have argued that we can preserve the legitimacy of inductive inference by abandoning the assumption that someone who accepts a hypothesis must treat it as certainly true. A popular suggestion is that accepting a hypothesis is merely a matter of being highly confident of it, for example, of giving it a probability greater than some threshold. One objection to this view is that the set of propositions that have high probability is not consistent. For example, in a large unbiased lottery, the probability that any particular ticket will not win is high, though we also know that some ticket will win. Thus if we accepted every proposition with high probability we would accept an inconsistent set of propositions. This is called the ‘lottery paradox’ (see Paradoxes, epistemic). Another objection to equating acceptance with high probability is that informativeness is a reason for accepting a hypothesis but is not a reason for giving the hypothesis high probability.

Several writers have suggested that we ought to think of acceptance as a risky decision and use decision theory to evaluate when acceptance is rational (see Decision and game theory §2). The thought is that acceptance has a certain cognitive utility, which is greater if the proposition accepted is true than if it is false; acceptance of a hypothesis is rational, at least so far as cognitive goals are concerned, if it maximizes expected cognitive utility. The cognitive utility of accepting a true hypothesis is higher the more informative the hypothesis is, and thus this account provides a place for both probability and informativeness in determining the rationality of inductive inference. Some versions of this approach take acceptance to imply certainty while others do not.

Inference to the best explanation

Inference to the best explanation is the procedure of choosing the hypothesis or theory that best explains the available data. The factors that make one explanation better than another may include depth, comprehensiveness, simplicity and unifying power. According to Harman (1965), explanatory inference plays a central role in both everyday and scientific thinking. In ordinary life, a person might make the inference that a fuse has blown to explain why several kitchen appliances stopped working all at once. Scientists also seem to engage in inference to the best explanation; for example, astronomers concluded that another planet must exist in order to account for aberrations in the orbit of Uranus. However, despite the suggestiveness of cases like these, the extent to which we do and should rely on inference to the best explanation is highly controversial.

1 The legitimacy of inference to the best explanation

If inference to the best explanation is legitimate, then a person is entitled to accept a hypothesis provided it meets certain minimal standards in accounting for the relevant data, and explains the data better than any other hypothesis available. But, presumably, when we make an inference from a body of evidence, our goal is to arrive at a further or wider grasp of the truth. Inference to the best explanation will advance this goal only if the satisfaction of explanatory desiderata makes a hypothesis likelier to be true. The trouble is that explanatory virtues (like breadth or simplicity) and truth appear to be unrelated (see Theoretical (epistemic) virtues). Under these circumstances, believing a hypothesis because of its explanatory value would not be much better than believing it because someone thought it up on your birthday. It seems that such a procedure will, if anything, hinder the search for truth, not promote it.

Proponents of inference to the best explanation may respond to this line of criticism in a number of ways:

(1) They could deny that truth is the goal of inquiry (see Scientific realism and antirealism §§1-2). This reply may become more difficult to sustain when inference to the best explanation is used in everyday life. For example, it would be uncomfortable to think that a jury which rejects a contention on explanatory grounds (say, for having too many loose ends) is not seeking the truth.
(2) Another response would be to deny that the goal of inquiry is *solely* to amass a body of truths. Rather, we seek (true) explanations of phenomena. Explanatory goodness thus stands alongside likelihood of truth as a distinct but legitimate basis for evaluating hypotheses. This suggestion, however, does not seem to dispel the concern that there may be a *conflict* between pursuit of truth and pursuit of explanatory goodness.
(3) Let us say that a hypothesis is *tested* in so far as it, or its consequences, is compared with observed data, and let us grant that the successful testing of a hypothesis by observations (*confirmation*) increases the likelihood that the hypothesis is true. One might then try to argue that better explanations are more testable by a body of data than inferior ones. In that event, the superior explanation will be better confirmed by the data, and favouring the superior explanation would at least indirectly further the pursuit of truth.

Consider, for illustrative purposes, the following all-too-crude way of linking simplicity and testability. Suppose hypothesis *H* explains a given phenomenon by positing one mechanism *A*, while its competitor *H** accounts for the same phenomenon by positing the joint action of two different mechanisms *B* and *C*. The simpler hypothesis *H* will be more readily tested because we need evidence to support only one independent claim (‘*A* is at work’), instead of two (‘*B* is at work’ and ‘*C* is at work’). A difficulty here is that one might just as well say that *H* is *less* testable than *H**, since *H** can be *disconfirmed* by finding evidence against either of its components. Friedman (1983) and others argue with much more sophistication and plausibility that: (a) explanatory hypotheses are ones that unify the data; and (b) to the extent that hypotheses participate in multifarious, unifying relations to the data, they are more thoroughly exposed to testing by that data. Hence, superior explanations are more strongly confirmed by observations, and have better claims to truth.

2 Inference to the best explanation and enumerative induction

Inference to the best explanation is *ampliative*. The conclusion one reaches is not a mere summary of the data on hand - one comes to believe something further which explains the data. We also recognize a pattern of ampliative inference called ‘enumerative induction’. This is the extrapolation of observed regularities to universal

generalizations or to conclusions about particular unobserved cases. Thus, given that every calico cat you have observed has been female, you may infer that the next calico cat you see will be female. This conclusion certainly goes beyond the data you possess, so enumerative induction is ampliative.

With these points in hand, we can consider a further response to the challenge raised in the previous section: (4) There is indeed no logical connection between the satisfaction of explanatory criteria and truth, but this gap does not impair the legitimacy of inference to the best explanation. For, arguably, no pattern of ampliative inference can be shown antecedently to lead to true conclusions (see Induction, epistemic issues in). If the lack of such a guarantee were to make a pattern of ampliative inference illegitimate, it would be improper for us to rely on enumerative induction. Since this result is absurd, there can be no force to the demand that explanatory goodness be demonstrably associated with truth.

However, not all patterns of ampliative inference are reasonable or acceptable. Hence, (4) as such does not establish that inference to the best explanation, in particular, has anything to recommend it. The outcome would be more telling if inference to the best explanation could be more closely linked with enumerative induction. Proceeding along these lines, Gilbert Harman has argued forcefully that all enumerative induction really *is* inference to the best explanation (at least implicitly). If so, the legitimacy we accord to induction cannot be wholly denied to inference to the best explanation.

A difficulty for this view is that we seem to make inductive inferences that in no way serve to explain what has been observed. For example, you might notice that there have been fewer people in the supermarket on Tuesdays than on other days. You conclude by induction that Tuesday is in general the least crowded day at the market. Yet, you may have no explanation at all for what you have observed, no idea why the store has had fewer customers on Tuesdays. It is therefore difficult to see how inference to the best explanation enters into your inductive reasoning. This objection follows Ennis (1968).

Still, there is something suggestive about the notion that inference to the best explanation is of a piece with enumerative induction. Suppose that inference to the best explanation favours simple hypotheses. The inductive extrapolation of observed regularities to other times and places also displays a methodological preference for certain kinds of uniformity or simplicity. This point is highlighted by various cases which can equally well be treated as instances of explanatory inference or of enumerative induction. Suppose you are trying to determine the functional dependence of two quantities, X and Y, and you have collected data points like (1,1), (2.5, 2.5), (4,4), and (5,5). It would be natural and reasonable to suppose that the function is $X = Y$, representable as a straight line passing through the data points. Reaching the conclusion $X = Y$ can be thought of as a simple extrapolation from the data given, that is, as an example of enumerative induction. There are, however, indefinitely many wavier curves that pass through the given data points - for example, the graph of the function $Y = \sin(2\pi X) + X$. The choice of a straight line to connect the points is sometimes cited as a paradigm of inference to the best explanation; one is opting for the simplest hypothesis (in this case, the simplest curve or function) that accounts for the data (see Simplicity (in scientific theories)). If curve-fitting cases provide reason to think that enumerative induction and inference to the best explanation really merge or overlap, a critic will be unable to accept one wholeheartedly while rejecting the other across the board.

3 The scope and success of inference to the best explanation

The discussion to this point has treated the legitimacy of inference to the best explanation as an all-or-nothing affair. However, explanatory inference seems to raise the greatest doubts when it is used to support hypotheses about *theoretical* entities - that is, about entities that are unobservable in principle. The basic concern seems to be that theory is underdetermined by evidence: if you can formulate one theory about unobservables to account for a body of evidence, you can formulate indefinitely many others. Inference to the best explanation will select one theory from among these as the correct theory if it best meets our criteria of explanatory adequacy. How, though, are we ever to verify that this choice is in fact the correct one? The candidate theories agree in the observations they predict, so no evidence we can collect will settle the matter.

The reservation here would appear to be that the use of inference to the best explanation in theoretical contexts exacerbates the possibility that explanatory value and truth may diverge. For, if inference to the best explanation does lead us astray in some theoretical context, we will be unable to discover the error by observation, and we will

have gone *hopelessly* astray. One response to this heightened concern would be retrenchment. For example, Reichenbach (1976) held that it is indeed proper to choose the simplest curve that fits one's data, as above - but only when that choice can be tested against additional data-points provided by observation. So, more generally, one might restrict the use of inference to the best explanation to non-theoretical contexts.

Another response by proponents of inference to the best explanation is to become more ambitious rather than less. Boyd (1991) and others maintain that science has historically demonstrated an impressive amount of *convergence*. That is, successor theories have tended to retain some important part of their predecessors' content. The best explanation of this fact is supposedly that our theories have become progressively more accurate. Now, if inference to the best explanation has had a large role to play in selecting scientific theories, the phenomenon of convergence provides evidence that inference to the best explanation leads to the truth, even in theoretical contexts.

Opinion about this ambitious line of thought has been sharply divided. One prominent objection is that, in so far as the argument purports to legitimate inference to the best explanation, it is unacceptably circular, as the thesis that inference to the best explanation reliably leads to the truth is itself established by inference to the best explanation (see Scientific realism and antirealism). Proponents of the argument deny that this circularity is objectionable. Also, altogether different defences of inference to the best explanation may sanction its use in theoretical settings.

4 Further issues

Bas van Fraassen (1989) and others have written critically about inference to the best explanation from a Bayesian or probabilist perspective. They hold that necessary and sufficient conditions for justified belief are provided by the probability calculus and the requirement that a subject's beliefs should be updated by the process of conditionalization (see Probability theory and epistemology §2). To the extent that inference to the best explanation imposes some further qualitative condition on the way one updates one's beliefs, such inference would lead one to accept, irrationally, bets that are guaranteed to lose. One way to try to meet this challenge would be to show how explanatory inference could be incorporated within a probabilist setting. Another response would be to argue that these critics have somehow misconstrued the way inference to the best explanation works.

There are various important aspects of inference to the best explanation that have not even been touched upon here. These include its implications for 'explanatory coherence' theories, the relation between inference to the best explanation and causal inference, and the utility of inference to the best explanation in responding to sceptical arguments (see the further reading suggestions offered below for references on these topics).

Inference, Indian theories of

The use of argument in rational inquiry in India reaches almost as far back in time as its oldest extant literature. Even in very early texts, one finds the deliberate use of modus tollens*, for example, to refute positions thought to be false. In light of such practice, it is not surprising to discover that Indian thinkers came to identify certain forms of reasoning and to study them systematically.*

The study of inference in India is, as Karl Potter (1977) has emphasized, not the study of valid reasoning as reflected in linguistic or paralinguistic forms, but the study of the circumstances in which knowledge of some facts permits knowledge of another fact, and of when acceptance by one person of some state of affairs as a fact requires that that person accept another as a fact. Still, the form of inference which came to be systematically investigated in India can be given schematically (see below).

*At the core of the study of inference in India is the use of a naïve realist ontology. The world consists of individual substances or things (*dravya*), universals (*sāmānya*), and relations between them. The fundamental relation is the one of occurrence (*vṛtti*). The relata of this relation are known as substratum (*dharmin*) and superstratum (*dharma*) respectively. The relation has two forms: contact (*saṃyoga*) and inherence (*samavāya*). So, for example, one individual substance, say a pot, may occur on another, say the ground, by the relation of contact. In this case, the pot is the superstratum and the ground is the substratum. Or a universal, say brownness, may occur in an individual substance, say a pot, by the relation of inherence. Here, brownness, the superstratum, inheres in the pot, the substratum. The converse of the relation of occurrence is the relation of possession.*

*Another important relation is the relation that one superstratum bears to another. This relation, known as pervasion (*vyāpti*), can be defined in terms of the occurrence relation. One superstratum pervades another just in case wherever the second occurs the first occurs. The converse of the pervasion relation is the concomitance relation. As a result of these relations, the world embodies a structure: if one superstratum* H *is concomitant with another superstratum* S*, and if a particular substratum* p *possesses the former superstratum, then it possesses the second. This structure is captured in this inferential schema:*

Pakṣa *(thesis):* p *has* S.
Hetu *(ground):* p *has* H.
Vyāpti *(pervasion): Whatever has* H *has* S.

Here are two paradigmatic cases of such an inference:

Pakṣa *(thesis):* p *has fire.*
Hetu *(ground):* p *has smoke.*
Vyāpti *(pervasion): Whatever has smoke has fire.*

Pakṣa *(thesis):* p *is a tree (that is, has tree-ness).*
Hetu *(ground):* p *is an oak (that is, has oak-ness).*
Vyāpti *(pervasion): Whatever is an oak (that is, has oak-ness) is a tree (that is, has tree-ness).*

1 Inference and rational inquiry

In tracing out the origin and development of the science of reasoning in general, and of inference (*anumāna*) in particular, one must be careful to distinguish the exercise and implicit recognition of forms of reasoning in thought and inquiry from their explicit articulation and systematic study. This distinction is well exemplified by classical Greek mathematicians: the forms of arguments used in their proofs far exceeded Aristotle's syllogistic and Stoic propositional logic combined. In a similar way, classical Indian thinkers did not articulate many forms of argument which they instinctively recognized as valid and routinely deployed in rational inquiry.

While such principles of logic as the law of non-contradiction, the law of double negation, the law of excluded middle, De Morgan's laws and the equivalence of a proposition and its contrapositive were widely and routinely used by Indian thinkers, their formulation was not taken up for systematic study. Hence, the use of these principles of logic is not discussed in the present entry. Instead, attention is confined to how Indian thinkers came to identify

inference as captured in the inferential scheme and how they made such inferences the object of systematic study.

The history of thought in India can be divided into three periods: the pre-classical period (up to the fourth century BC), the classical period (up to the tenth century AD) and the scholastic period (from the eleventh century on). During the pre-classical period the practice of rational inquiry and debate developed, furnishing the raw material for the formulation of works on the science of reason - *hetu-śāstra* or *nyāya*, as the Indian thinkers called it - which appeared at the beginning of the classical period and played an important role in every major school of philosophical and empirical thought.

Rational inquiry comprises the search for reasons for publicly accepted facts, subject to public and rational scrutiny. It is an activity which involves people both severally and collectively. It involves people severally in so far as individual people are the locus of the exercise of reason. It involves people collectively in so far as the exercise of reason is sharpened by the scrutiny of others. Inference is central to both its individual and collective exercise.

Undoubtedly, the Indian science of reason has its origins in the emergence of rational inquiry and debate. However, the origins of rational inquiry and debate are not clear, the relevant literature being scant and the references therein scanty. None the less, a sketch of the earliest period can be constructed.

2 Seeds of rational inquiry

The seeds of rational inquiry in India are found in appendices to its earliest extant body of literature, the Vedas (Wisdom, Knowledge), composed between the thirteenth and eleventh centuries BC, and comprising four collections (*samhitās*): the *Ṛg Veda (Wisdom of the Verses)*, hymns dedicated to the gods worshipped by the Indo-Aryans; the *Yajur Veda (Wisdom of the Sacrificial Formulas)*, sacred formulas recited at rituals; the *Sāma Veda (Wisdom of the Chants)*, an anthology of chants used by priests in their rituals; and the *Atharva Veda (Wisdom of the Atharva Priests)*, a compendium of hymns, incantations and magic charms used by priests.

Their appendices include the Brāhmaṇas (Books Pertaining to Prayer, dating from between the eleventh and eighth centuries BC), and the Āraṇyakas (Books Studied in the Forest, from between the ninth and seventh centuries BC). In them one finds speculation about the causal relations involved in sacrificial rites. Thus, one encounters the concept of *ṛta*, the natural order of things, which underwrites the efficacy of sacrifice, that is, the capacity of the performance of sacrificial rites to bring about prescribed effects. One also encounters the concept of karma, whereby deeds performed at one point in one's life have consequences which manifest themselves in terms of pain and pleasure experienced later in one's life or in one's later life (see Karma and rebirth, Indian conceptions of). Moreover, speculation about the origins of the universe is also found in the Aitareya Āraṇyaka.

The kind of speculation just described appears to have become the object of public contests in which contestants showed off their knowledge of ritual and their proto-cosmological speculations as to its basis. Inevitably, the views of these contestants differed, and indeed conflicted. Such differences undoubtedly gave rise to questions of how to establish the correctness of one view and how to adjudicate between conflicting views. In this way, according to some scholars (for example, Witzel 1987), arose the practice of public debates, so common in the classical and scholastic periods.

In any event, over the course of time the range of objects of speculation grew to include not only questions of cosmology but also questions of metaphysics, especially the question of what there is, and the naturally ensuing question of how one knows or can justify one's claims about what there is. Thus, one finds views purporting to assist humankind in the alleviation of the unhappiness it suffers, views about what comprises happiness, what constitutes matter, whether or not there is an eternal soul, whether or not there is free will, and whether or not knowledge is possible. The diversity of views includes not only views defended in the Brahmanical literature, in particular the Upaniṣads (dating from the eighth to sixth centuries BC) and, in the Buddhist canon, the *Tipiṭika (Three Baskets*, dating from after the sixth century BC), but also dissenting views reported in the same literature, such as those of the materialist and atomist Ajita Kesakambalin, of the determinist Makkhali Gosāla, and of the sceptic Sañjaya Belatthiputta.

Central to the pursuit of these questions is the concept of causation, which itself fell within the purview of rational inquiry. Thus, for example, in the Śvetaśvatara Upaniṣad (1.2), a number of views pertaining to causation are

reported: determinism (*niyativāda*), indeterminism (*yadṛcchāvāda*) and latency (*svabhāva*).

While the range of rational inquiry increased, it also deepened, for rational inquiry (*anvīkṣikī*, *parīkṣā*) itself became the object of rational inquiry, that is, questions were raised about how facts are known. Thus, one finds as early as the Taittirīya Āraṇyaka enumerations of the sources of knowledge (*pramāṇas*), namely perception (*pratyakṣa*), inference (*anumāna*), religious authority (*smṛti*) and tradition (*aitihya*).

In short, during the pre-classical period, three practices important to the development of the study of inference make their appearance. Rational inquiry into the causes of things, rational inquiry into how things are known, and public contests which perhaps anticipate public debates.

3 Growth of rational inquiry

By the fifth century BC, great social change was taking place in India and a period of intense intellectual activity began. Rational inquiry had taken hold and its topics were not confined to cosmology and soteriology. True, apart from Pāṇini's *Aṣṭādhyāyī*, the world's earliest extant grammar, no works devoted to such topics as agriculture, architecture, astronomy, grammar, law, mathematics, medicine, phonology and statecraft date from this period. None the less, scholars agree that this period contains the roots of many works not redacted until around the turn of the millennium, including *Kṛṣiśāstra (Treatise on Agriculture)*, *Śilpaśāstra (Treatise on Architecture)*, *Jyotiṣaśāstra (Treatise on Astronomy)*, *Dharmaśāstra (Treatise on Law)*, *Carakasamhitā(Caraka's Collection*, a medical treatise) and *Arthaśāstra (Treatise on Wealth*, a political treatise).

Allusions to questions about the number of sources of knowledge, their nature and their objects are found here and there in the Upaniṣads (for example, Maitrī Upaniṣad). Similar issues find elaboration in the Buddhist literature dating from the same period.

Many of the dialogues of the Buddha, Siddhārtha Gautama, show that some version of the law of non-contradiction is to be respected, that is, they show adherence to the view that consistency is a necessary condition for truth. Moreover, many dialogues suggest that truth consists in correspondence to facts, independent of observers. Indeed, a persistent message of the Buddha is that knowledge is grounded in personal observation and inference, where observation is taken to include paranormal observation (though observation none the less). In addition, Buddhists of this period recognize that inference itself must be grounded in causal explanation.

Indeed, much energy is devoted to the development of causal explanations, not only with respect to grounding soteriological claims, for example, as reflected in the doctrine of dependent origination (*pratītya-samutpada*), but even more broadly. Thus, for example, the *Paṭṭhāna* (Causes), one of the seven works of the *Abhidhamma piṭaka* (Basket of Further Doctrine), itself one of the three 'baskets' making up the Buddhist canon, classifies intentional states in terms of twenty-four kinds of causal relations. Causal relations are invoked to explain perceptual states as well. Indeed causal relations are routinely presupposed in discussions of physical events and processes, such as how seeds give rise to shoots (see Causation, Indian theories of).

Moreover, these thinkers not only used causal relations to construct explanations, they were clearly sensitive to the problem of how to establish the existence of causal relations. Passages in the Pāli Canon indicate awareness of the problem of drawing general conclusions from limited observations. Indeed, this period seems to have witnessed the formulation of Mill's method of agreement and difference, known to Indian thinkers as the method of *anvaya-vyatireka*. Such a method, as G. Cardona (1967) has shown, was clearly known to Kātyāyana (*fl.* third century BC), the author of the earliest extant commentary on the *Aṣṭādhyāyī*, and seems to have been known to the Lokāyatikas, who also date from this early period (see Materialism, Indian school of).

Publicly organized debates (*pariṣad*) were commonplace, alluded to in various Upaniṣads (Chāndogya Upaniṣad 5.3.1; Bṛhadāraṇyaka Upaniṣad 6.2.1) and exemplified in over half of the thirty-four *suttas* of the Buddhist *Dīgha Nikāya* (Collection of Long Discourses), which are a part of the *Sutta Piṭaka (Basket of Discourses)*, one of the three 'baskets' of the Buddhist canon. A better-known, but much later, example of such engagements is the Buddhist work *Milindapañho (Questions of King Milinda)*.

The earliest example of protracted systematic rational inquiry into metaphysical issues is found in Moggalīputta Tissa's *Kathāvatthu (Points of Controversy)*, a Buddhist work of the third century BC. It sets out the refutation of some two hundred propositions over which the Theravādins, one of the Buddhist schools, disagreed with other

Buddhist schools. The treatment of each point comprises a debate between a proponent and an opponent. The refutations turn on demonstrating the inconsistency of a set of propositions.

Not only is the form of the debate canonical but the form of the reasoning is as well. Thus, for example, one finds the following pattern throughout Book 1, Chapter 1:

Proponent: Is *A B*?
Opponent: Yes.
Proponent: Is *C D*?
Opponent: No.
Proponent: Acknowledge defeat, since if *A* is *B*, then *C* is *D*.

It is clear that refutation hinges on inconsistency as exhibited by the following propositional schema: p, $\neg q$, $p \rightarrow q$. Though, as I. Bochenski (1956) has remarked, no propositional forms are identified as such, it is none the less clear that inconsistency of a certain form was considered a decisive refutation.

4 Appearance of the canonical inference

In the classical period, as stated above, begins the redaction of works codifying the results of systematic, rational inquiry begun earlier, not only into such fields as grammar, architecture, mathematics, law and politics, but also into the enduring philosophical questions, including the nature of rational inquiry itself. This is made clear in a brief passage in the *Arthaśāstra* (1.2), a work on statecraft attributed to Kauṭilya (*fl.* fourth century BC).

The texts surviving from this period have diverse origins. There are two important passages in the *Carakasamhitā*, a medical text which was redacted in its current form in the first century AD. There are also texts from the philosophical literature, both Brahmanical and non-Brahmanical. The best-known texts pertaining to inference are in a work attributed to Akṣapāda Gautama, the *Nyāyasūtra*, a Brahmanical treatise on rational inquiry, whose actual redaction is thought to date to the third century AD (see Gautama, Akṣapāda). Another Brahmanical work touching upon inference is the *Vaiśeṣikasūtra*, a work on speculative ontology attributed to Kaṇāda; this was redacted in its current form perhaps at the beginning of the second century AD, though perhaps some of its passages date back to the second century BC. Still another Brahmanical work, which survives only in fragments (which have been collected by E. Frauwallner), is a Sāōkhya one entitled *Ṣaṣṭitantra* (Sixty Doctrines), attributed by some to Pañcaśikha (*fl.* second century BC) and by others to Varṣaṇya (*fl.* after second century AD).

The remaining texts are found in the Buddhist philosophical literature. To begin with, there are four passages in four works by the Buddhist idealist Asaōga (*fl.* fourth century AD): one in his *Abhidharmasangītiśāstra (Treatise on the Proclamation of the Abhidharma)*, one in his *Abhidharmasamuccaya (Compendium of the Abhidharma)*, one at the end of a chapter of his *Yogācārabhūmiśāstra (Treatise on the Stages of Yogic Practice)* and one in a work which survives only in Chinese translation, *Shun Zheng Lun (Treatise on According with What is Correct)*. In addition, Vasubandhu (*fl.* fifth century AD), another Buddhist idealist, thought to be the younger brother of Asaōga, wrote at least three works on debate: *Ru Shi Lun (Treatise on Resembling the Facts*, reconstructed in Sanskrit as *Tarkaśāstra*, or Treatise on Reasoning), which survives only in Chinese translation, the *Vādavidhi (Rules of Debate)*, whose Sanskrit fragments have been collected by E. Frauwallner, and the *Vādavidhāna (Precepts of Debate)*. Finally, there are two other works of unknown author and unknown date which survive only in Chinese translation: *Fang Bian Xin Lun* (reconstructed in Sanskrit by G. Tucci as *Upāyahṛdaya*, or Essential Methods), and *Xian Zhang Sheng Jiao Lun* (reconstructed in Sanskrit by G. Tucci as *Prakaraṇāryavācāśāstra*, or Treatise on the Noble Words of Explanation).

With the notable exception of the *Vaiśeṣikasūtra*, which treats inference only as an epistemic process, the greater part of each text is devoted to inference as argument in debate. These texts typically enumerate, define or classify public discussions, propositions as they are used in public discussions, parts of arguments, qualities which either enhance or detract from a discussant's performance, and statements or actions by a discussant which warrant his being considered defeated, including the uttering of various fallacies.

These texts identify the form of argument used in debate. Thus, for example, the *Nyāyasūtra* (1.1.32), like the *Carakasamhitā* (2.8.31), defines an argument as having five parts: the thesis (pakṣa), or proposition (*pratijñā*); the ground, or reason (*hetu*); the corroboration (*dṛṣṭānta*); the application (*upanaya*); and the conclusion (*nigamana*).

The *Carakasamhitā* furnishes the following example:

Thesis: The soul is non-eternal.
Ground: Because it is detectable by the senses.
Corroboration: It is like a pot.
Application: As a pot is detectable by the senses, and is non-eternal, so is the soul detectable by the senses.
______________________________________ Conclusion: Therefore, the soul is non-eternal.

This form of argument clearly reflects the debate situation. First, one propounds a proposition, that is, one sets forth a proposition to be proved. One then states the ground or reason for the proposition. Next, one corroborates with an example the implicit connection between the property mentioned in the proposition and the property adduced as its ground. The immediately ensuing step, the application, spells out the analogy between the example and the subject of the proposition. Notice that this part of the argument retains vestiges of the analogical reasoning that is no doubt its predecessor. Finally, one asserts the proposition.

As was obvious to these thinkers, not all arguments of this form are good arguments. Not surprisingly, the texts catalogue bad arguments. Grounds adduced in arguments catalogued as bad are referred to as non-grounds (*ahetu*) or pseudo-grounds (*hetu-ābhāsa*). It is difficult to be sure what the basis of the classification was. In the case of the *Nyāyasūtra*, the author gives neither a definition nor an example. Even in cases where definitions and examples are given, as in the *Carakasamhitā*, the modern reader is not always sure what is intended. In all likelihood, included here are cases where the premises of the argument can be true but the conclusion false - formal fallacies - and cases where the argument, though formally valid, is none the less unpersuasive, for example, because its ground (*hetu*) is as controversial as its conclusion.

These very same texts, as well as the *Vaiśeṣikasūtra*, touch on inference as an epistemic process. While the examples of inference furnished all comprise expressions corresponding with the thesis (*pakṣa*) and the ground (*hetu*) of the inferential schema, not all the texts are equally explicit in identifying the form of inference. In particular, both the *Carakasamhitā* (1.11.21-2) and the *Nyāyasūtra* (1.1.5) define inference as knowledge of one fact on the basis of knowledge of another, leaving unmentioned any knowledge of a relation linking the two. Moreover, these texts classify inferences on the basis of characteristics completely extrinsic to the logical features of the inferences adduced. Inferences appear to be classified according to the temporal order of the occurrences of the properties corresponding with those in the thesis (*pakṣa*) and the ground (*hetu*) of the inferential schema.

5 Formalization of the canonical inference

Improved definitions, which mention not only what corresponds with the thesis (*pakṣa*) and the ground (*hetu*) of the inferential schema, but also what corresponds with its pervasion (*vyāpti*), are found in the *Ṣaṣṭitantra*, the *Vaiśeṣikasūtra* and the *Abhidharmasamuccaya* (Further Doctrine Collection), where knowledge of a relation is explicitly included in their definitions of inference. However, what corresponds with pervasion (*vyāpti*) in the inferential schema is not a formal relation, but one of a miscellany of material relations instead. The *Ṣaṣṭitantra* enumerates seven such relations, while the *Vaiśeṣikasūtra* (9.20) enumerates five: the relation of cause to effect, of effect to cause, of contact, of exclusion, and of inherence. In each of these texts, the miscellany of material relations serves to classify inferences. Thus, although in these three works the parts of an inference are made explicit, the formal connection between them remains implicit.

As Katsura (1986) has observed, the earliest extant texts to grapple explicitly with making the formal connection between the parts of an inference apparent are those of Vasubandhu. To begin with, in his *Vādavidhi*, Vasubandhu makes it clear that the relation, knowledge of which is necessary for inference, is not just any in a miscellany of material relations, but a formal relation, which he designates in some places as *avinābhāva* (‘being a *sine qua non*’) and in others as *nāntarīyakatva* (‘being unmediated’).

At the same time, Vasubandhu exploits the idea, ascribed by Asaōga in his *Shun Zheng Lun* to an unknown school (thought by at least one scholar to be the Sāōkhya school), that a ground (*hetu*) in an inference is a proper one if and only if it satisfies three conditions - the so-called *trirūpahetu*, or the grounding property (*hetu*) in its three forms. The first form is that the grounding property should occur in the subject of an inference (*pakṣa*). The second is that the grounding property should occur in those substrata similar to the subject in so far as they have the

property to be established (*sādhya*). And third, the grounding property should not occur in any of those substrata dissimilar from the subject in so far as they lack the property to be established. The first form corresponds to the inferential schema's ground (*hetu*), while the second and the third correspond to its pervasion (*vyāpti*). With the formulation of the *trirūpahetu*, the formal nature of the classical Indian inference is at last fully circumscribed. This form is succinctly displayed by the following schema:

Pakṣa (thesis): *p* has *S*.
Hetu (ground): *p* has *H*.
Vyāpti (pervasion): Whatever has *H* has *S*.

An insightful distinction found in Vasubandhu's work is the one between inference for oneself and inference for others, which makes explicit what had previously been only implicit, namely that inference, the cognitive process whereby one increases one's knowledge, and argument, the device of persuasion, are but two sides of a single coin.

Dignāga (*fl.* beginning of the sixth century), another Buddhist philosopher, consolidates and systematizes the insights into the formal basis of inference found in Vasubandhu's works. First, he makes the distinction between inference for oneself and inference for others the organizational cornerstone of his treatment of inference. Second, he undertakes to make the three forms of the grounding property, the so-called *trirūpahetu*, more precise, pressing into service the Sanskrit particle *eva* (only). And third, and perhaps most strikingly, he devises the *hetucakra* ('wheel of reasons'), a three-by-three matrix set up to classify pseudo-grounds in the light of the last two forms of the *trirūpahetu*. On the one hand, there are the three cases of the grounding property occurring in some, none or all of the substrata where the property to be established occurs. On the other hand, there are the three cases of the grounding property occurring in some, none or all of the substrata where the property to be established does not occur.

6 Developments after formalization

Dignāga's works set the framework within which subsequent Buddhist thinkers address philosophical issues pertaining to inference and debate. Thus, Śankarasvāmin (*fl.* sixth century) writes a brief manual of inference for Buddhists, called the *Nyāyapraveśa (Beginning Logic)*, based directly on Dignāga's work. Not long thereafter, Dharmakīrti (*c.*600-60), the great Buddhist metaphysician, also elaborates his views on inference and debate within the framework found in Dignāga.

Dharmakīrti makes at least two contributions to the treatment of inference. Recall that one of the developments found in Vasubandhu's work was the identification of the formal contribution of what corresponds with the inferential schema's pervasion (*vyāpti*), making it explicit that the corresponding relation is a formal one. One of Vasubandhu's terms for it, namely *avinābhāva*, or 'being a *sine qua non*', made it clear that inference involves some form of necessity. The question raised and systematically investigated by Dharmakīrti is: in what does this necessity consist? His answer is that it consists in two things: the causation relation (*tadutpatti*) and the identity relation (*tādātmya*). The second contribution by Dharmakīrti is his attempt to bring knowledge of absences, or roughly negative facts, within the purview of inference (see Negative facts in classical Indian philosophy §§1-2).

Another important Buddhist thinker who treated inference is Dharmottara (*fl.* eighth century). He wrote a useful commentary on Dharmakīrti's widely read *Nyāyabindu (Drop of Logic)*.

Dignāga not only had a profound influence on his Buddhist followers, he also influenced his non-Buddhist contemporaries and their followers. It would be wrong, however, to conclude that every adoption of ideas similar to those used by Dignāga in his works should be attributed to him. After all, we cannot be certain that his contemporaries did not arrive at similar ideas independently or get their ideas from sources common to them and Dignāga. Thus, for example, in his *Nyāyāvatāra* (Descent into Logic), the Jaina thinker Siddhasena Divākara (*c.* fifth century), a contemporary of Vasubandhu, also speaks of the formal relation *antarvyāpti*, or inner pervasion, which corresponds to *vyāpti*, or pervasion, in the inferential schema. In addition, Praśastapāda (*fl.* sixth century), an adherent of the Vaiśeṣika school and near contemporary of Dignāga, also defines inference in a way which not only makes clear its formal nature but also uses the quantificational adjective *sarva* (all) to make the formal connection precise.

At the same time, some authors of this period seem to have retained a view of inference akin to the one found in the *Ṣaṣṭitantra* and the *Vaiśeṣikasūtra*, in which the formal role of what corresponds with the inferential schema's pervasion (*vyāpti*) has yet to have been identified. This is true both of Vātsyāyana (*fl.* fifth century), the author of the earliest extant commentary on the *Nyāyasūtra*, and of Śabara (*fl.* sixth century), the author of the earliest extant commentary on Jaimini's *Mīmāṃsāsūtra*.

However, it was not long before the advocates of both Nyāya and Mīmāṃsāadapted to the formal view of inference. On the one hand, one finds that the Mīmāṃsāthinker Kumārila Bhaṭṭa (*fl.* early seventh century) adopts, without special comment, the formal perspective. On the other hand, though the Nyāya thinker Uddyotakara (*fl.* late sixth century) argues vigorously against many of Dignāga's views, he none the less advocates a view which presupposes the formalization found in them. For example, Uddyotakara rejects the suitability of the quantifying particle *eva* (only) in the formulation of the three forms of the grounding property (*trirūpahetu*), yet he himself introduces a classification of inference which presupposes Dignāga's formalization. Thus, Uddyotakara classifies grounds (*hetu*) as: concomitant (*anvaya*), where nothing distinct from a particular substratum *p* (in the inferential schema) fails to have the property *S*; exclusive (*vyatireka*), where nothing distinct from *p* has *S*; and both concomitant and exclusive, where some things distinct from *p* have *S* and some fail to have *S*. This classification becomes the standard classification for the adherents of Nyāya during the scholastic period.

The developments of the scholastic period are confined almost entirely to the so-called Navya-Nyāya school. Its contributors to the treatment of inference include Gaōgeśa (*fl.* fourteenth century), perhaps the most outstanding of all the thinkers of this school, Raghunātha (*fl.* early sixteenth century), Jagadiśa (*fl.* later seventeenth century) and Gadādhāra (1604-1709).

We conclude with two warnings. First, the treatment of Indian inference here has centred exclusively on tracing out the unfolding of the inferential schema in the history of Indian thought. It has only hinted at the rich philosophical debates that arose among those Indian thinkers eager to harmonize their insights into the formal nature of inference with their views pertaining to metaphysical and linguistic questions. Second, the treatment has not prepared the reader for the intricacies and pitfalls of the terminology used by Indian thinkers in their discussions of inference. The terminology is both ambiguous and inconstant, not just as one goes from the work of one thinker to that of another, but even within the work of a single thinker. Annoying as the contemporary reader may find such ambiguity, it is necessary to remember that this is an inevitable by-product of intellectual fermentation.

Infinitary logics

An infinitary logic arises from ordinary first-order logic when one or more of its finitary properties is allowed to become infinite, for example, by admitting infinitely long formulas or infinitely long or infinitely branched proof figures. The need to extend first-order logic became pressing in the late 1950s when it was realized that many of the fundamental notions of mathematics cannot be expressed in first-order logic in a way that would allow for their logical analysis. Because infinitary logics often do not suffer the same limitation, they have become an essential tool in mathematical logic.

Traditionally, logic - considered as the analysis of valid human reasoning, or something intimately connected with it - was seen as having to be finitary in its expressions, inferences and proofs, owing to the finitude of the human mind. This situation began to change in the second half of the nineteenth century, for two principal reasons. First, in philosophy, the Neo-Kantian conception of ‘*Geltung*’ (roughly, ‘validity’) gave rise both to a logical reconstructionist view in the philosophy of science - represented most prominently by Carnap - and to an anti-psychologistic strain of logical theory - represented most prominently by Frege. Second, in mathematics, although increased attention to foundations led to the elimination from analysis of a direct appeal to the infinite, it also led to increased emphasis on the infinite through the development of set theory.

In Löwenheim’s proof of his famous theorem (1915), we find perhaps the first deliberate use of infinitely long formulas and strings of quantifiers (see Löwenheim-Skolem theorems and nonstandard models). But development was interrupted for some thirty years by the influence of Hilbert, who stressed the finitary standpoint and focused on (the proof theory of) first-order logic and elementary recursion theory (see Hilbert’s programme and formalism).

In the early 1950s older modes of research (for example, investigation by logical reconstruction relying on infinitary means whenever necessary) were knit together again and model theory became fruitful. However, with the success of first-order model theory the deficiencies of this language for the expression of mathematical concepts (for example, compactness arguments) also became apparent. Thus, by the end of the decade, an extended model theory which searched for stronger logics began to emerge. Infinitary logics (ILs), in addition to fragments of *n*th-order logic, new quantifiers, and so on, proved to be a useful tool in increasing the expressive power of logical language.

Karp, Henkin, Tarski and others pioneered the development of ILs. At roughly the same time, ILs were introduced into proof theory as a means of streamlining and extending known techniques for consistency proofs. Since the Lindström theorems (see Lindström 1969) showed that interesting properties of first-order logic (for example, compactness; see Hanf 1964) must be lost if one tries to extend it, a new phase of research began when it was discovered that restriction to ‘admissible’ parts of a language not only preserves the usefulness of ILs but also yields suitable variants of lost properties (for example, Barwise compactness; see Barwise 1975).

Let $\mathcal{L}_{\kappa\lambda}$, with κ, λ (regular) infinite cardinals, denote an otherwise first-order language that allows for disjunctions (conjunctions) with fewer than κ disjuncts (conjuncts) and fewer than λ free variables (and hence fewer than λ quantifiers). (If κ or λ is arbitrary, we write ∞ instead.) Recall that ω is the cardinality of the natural numbers and ω_1 the least cardinal bigger than ω, that is, the cardinality of the reals in case the continuum hypothesis is true. In this notation ordinary first-order language $\mathcal{L}^1$, allowing for only finitely many disjuncts and free variables, becomes the finitary $\mathcal{L}_{\omega\omega}$.

Suppose we supplement a first-order language $\mathcal{L}_{\omega\omega}$ with an infinitary disjunctor, $\bigvee$, and add the formation rule: if Φ is a countable set of first-order formulas $\{\phi_n\colon n \in \omega\}$, then $\bigvee \Phi$ is a formula of $\mathcal{L}_{\omega_1\omega}$, being the countable disjunction of all $\phi \in \Phi$. Similarly for the infinitary conjunctor $\bigwedge \Phi$, though it might also be defined by De Morgan’s law as $\neg \bigvee \{\neg\phi_n\colon n \in \omega\}$.

To obtain a semantics for $\mathcal{L}_{\omega_1\omega}$, add to the standard semantics the clause

$$\mathrm{F} \models \bigvee \Phi \text{ iff there is some } \phi \in \Phi \text{ such that } \mathrm{F} \models \phi$$

and the corresponding clause for $\bigwedge \Phi$. Complementing the deduction rules of $\mathcal{L}_{\omega\omega}$ with the obvious variants for

$\bigvee$ (respectively, $\bigwedge$) results in a sound and complete calculus for $\mathcal{L}_{\omega_1\omega}$. Thus, for example, one might add the following rules:

(1) $\vdash \phi \rightarrow \bigvee \Phi$, for $\phi \in \Phi$
(2) If $\vdash \phi \rightarrow \psi$, for all $\phi \in \Phi$, then $\vdash \bigvee \Phi \rightarrow \psi$.

Two cautionary notes are in order here. First, completeness holds only with respect to the valid sentences and does not generally hold with regard to consequence (specifically, if the set of premises is not countable; see Scott 1965). Second, (2) shows that infinitely long derivations may occur, transforming the formal system into a semi-formal one.

In $\mathcal{L}_{\omega_1\omega}$ mathematical concepts that are not axiomatizable in ordinary $\mathcal{L}_{\omega\omega}$ become so. Simple examples include: the class of torsion groups, with the addition to the group axioms of the axiom

$$\forall x \bigvee \{\underbrace{x \circ \ldots \circ x}_{n \text{ times}} = e\colon\ 1 \leq n \in \omega\}$$

(where *e* denotes the neutral element of a group); the class of fields with characteristic unequal zero, with the addition to the field axioms of

$$\forall x \bigvee \{\underbrace{1 + \ldots + 1}_{n \text{ times}} = 0\colon\ 2 \leq n \in \omega\};$$

and the class of structures isomorphic to the natural numbers, with the addition to the first two Peano axioms of

$$\forall x \bigvee \{\underbrace{\mathrm{S} \ldots \mathrm{S}}_{n \text{ times}}0 = x\colon\ 0 \leq n \in \omega\}$$

(where S denotes the successor function). Among the logical metatheorems, downward Löwenheim-Skolem holds. Thus, if a sentence $\phi \in \mathcal{L}_{\omega_1\omega}$ is satisfiable, then it is countably satisfiable. The upward theorem is more difficult, requiring the use of the Hanf number $\mathbf{H}_\alpha$. If ϕ is satisfiable in all cardinalities $\mathbf{H}_\alpha$, with $\alpha < \omega_1$ and $\mathbf{H}$ a kind of superexponentiation of the alephs, then ϕ is satisfiable in all infinite cardinalities. Among other metatheorems that hold, Lopez-Escobar (1965), using a complete Gentzen system, was able to establish Craig's interpolation theorem and Beth's definability theorem (see also Karp 1964, Keisler 1971; Beth's theorem and Craig's theorem).

For languages between $\mathcal{L}_{\omega_1\omega}$ and $\mathcal{L}_{\infty\infty}$, as expected, the expressive power increases as the language becomes more infinitary. Thus, for example, each well-ordering is characterizable up to isomorphism by a sentence ϕ of $\mathcal{L}_{\infty\omega}$ and the notion of well-ordering itself becomes definable in $\mathcal{L}_{\omega_1\omega_1}$. Large languages thus admit more applications to mathematics (especially in algebraic subjects), even though many fundamental second-order concepts (for example, the class of topological spaces) remain inexpressible in such a language as $\mathcal{L}_{\infty\infty}$. In addition, as the language becomes larger, the rather coherent framework of metatheoretic results that still hold for $\mathcal{L}_{\omega_1\omega}$ dissolves (see Dickmann 1975, 1985).

In proof theory, the Gentzen-type consistency proofs of the early 1950s (see Proof theory) using ω-logic gained considerably in clarity by being reformulated in $\mathcal{L}_{\omega_1\omega}$ (see Tait 1968). Another kind of IL, ordinary $\mathcal{L}^1$ with infinitely long terms, was used to define functionals of finite type and was first employed by Tait (1965) to recast Gödel's *Dialectica* interpretation (producing a second link between infinitary logic and recursion theory in addition to that forged by the introduction of admissible sets; see Intuitionism §6).

Infinity

The infinite is standardly conceived as that which is endless, unlimited, immeasurable. It also has theological connotations of absoluteness and perfection. From the dawn of civilization, it has held a special fascination: people have been captivated by the boundlessness of space and time, by the mystery of numbers going on forever, by the paradoxes of endless divisibility and by the riddles of divine perfection.

The infinite is of profound importance to mathematics. Nevertheless, the relationship between the two has been a curiously ambivalent one. It is clear that mathematics in some sense presupposes the infinite, for instance in the fact that there is no largest integer. But the idea that the infinite should itself be an object of mathematical study has time and again been subjected to ridicule. In the nineteenth century this orthodoxy was challenged, with the advent of 'transfinite arithmetic'. Many, however, have remained sceptical, believing that the infinite is inherently beyond our grasp.

Perhaps their scepticism should be trained on the infinite itself: perhaps the concept is ultimately incoherent. It is certainly riddled with paradoxes. Yet we cannot simply jettison it. This is why the paradoxes are so acute. The roots of these paradoxes lie in our own finitude: it is self-conscious awareness of that finitude which gives us our initial sense of a contrasting infinite, and, at the same time, makes us despair of knowing anything about it, or having any kind of grasp of it. This creates a tension. We feel pressure to acknowledge the infinite, and we feel pressure not to. In trying to come to terms with the infinite, we are trying to come to terms with a basic conflict in ourselves.

1 Early Greek thought

The Greek word *peras* is usually translated as 'limit' or 'bound'. *To apeiron* denotes that which has no *peras*, the unlimited or unbounded: the infinite. *To apeiron* made its first significant appearance in early Greek thought with Anaximander of Miletus in the sixth century BC (see Anaximander §2). He thought of it as the boundless, imperishable, ultimate source of everything that is. He also thought of it as that to which all things must eventually return in order to atone for the injustices and disharmony which result from their transitory existence.

Anaximander was something of an exception, however. On the whole, the Greeks abhorred the infinite (as the old adage has it). More typical of that era were the Pythagoreans, a religious society founded by Pythagoras (see Pythagoreanism §2). They believed in two basic cosmological principles, *Peras* and *Apeiron*, the former subsuming all that was good, the latter all that was bad. They held further that the whole of creation was to be understood in terms of, and indeed was ultimately constituted by, the positive integers $1, 2, 3, \ldots$; and that this was made possible by the fact that *Peras* was continuously subjugating *Apeiron* (the integers themselves, of course, are each finite). The Pythagoreans were followed to some extent in these beliefs by Plato, who also held that it was the imposition of limits on the unlimited that accounted for all the numerically definable phenomena that surround us.

However, the Pythagoreans soon learned to their dismay that they could not simply relegate the infinite to the role of cosmic villain. This was because of Pythagoras' own discovery that the square on the hypotenuse of a right-angled triangle is equal to the sum of the squares on the other two sides. Given this theorem, the ratio of a square's diagonal to each side is $\sqrt{2} : 1$. There are some good approximations to this ratio: it is a little more than $7 : 5$, for example, and a little less than $17 : 12$. Indeed there are approximations of any desired degree of accuracy. Nevertheless, given the basic tenets of Pythagoreanism, it ought to be *exactly* $p : q$, for some pair of positive integers *p* and *q*. The problem was that they discovered a proof that it is not, which they regarded as nothing short of catastrophic. According to legend, one of them was shipwrecked at sea for revealing the discovery to their enemies. The Pythagoreans had stumbled across the 'irrational' within mathematics. They had seen the limitations of the positive integers, and had thereby been forced to acknowledge the infinite in their very midst.

At around the same time, Zeno of Elea was formulating various celebrated paradoxes connected with the infinite (see Zeno of Elea §6). Best known of these is the paradox of Achilles and the tortoise: Achilles, who runs much faster than the tortoise, cannot overtake it in a race if he lets it start a certain distance ahead of him. For in order to do so he must first reach the point from which the tortoise started, by which time the tortoise will have advanced a fraction of the distance initially separating them; he must then make up this new distance, by which time the

tortoise will have advanced again; and so on *ad infinitum*. Such paradoxes, as well as having a profound impact on the history of thought about infinity, did much to reinforce early Greek hostility to the concept.

2 Aristotle

Aristotle's understanding of the infinite was an essentially modern one in so far as he defined it as the untraversable or never-ending. But he perceived a basic dilemma. On the one hand Zeno's paradoxes, along with a host of other considerations, show that the concept of the infinite really does resist a certain kind of application to reality. On the other hand there seems to be no prospect of doing without the concept, as the Pythagoreans had effectively realized. As well as $\sqrt{2}$, time seems to be infinite, numbers seem to go on *ad infinitum*, and space, time and matter all seem to be infinitely divisible.

Aristotle's solution to this dilemma was masterly. It has dominated all subsequent thought on the infinite, and until very recently was adopted by almost everyone who considered the topic. Aristotle distinguished between the 'actual infinite' and the 'potential infinite'. The actual infinite is that whose infinitude exists, or is given, at some point in time. The potential infinite is that whose infinitude exists, or is given, *over* time. All objections to the infinite, Aristotle insisted, are objections to the actual infinite. The potential infinite is a fundamental feature of reality. It is there to be acknowledged in any process which can never end: in the process of counting, for example, in various processes of division, or in the passage of time itself. The reason why paradoxes such as Zeno's arise is that we pay insufficient heed to this distinction. Having seen, for example, that there can be no end to the process of dividing a given racecourse, we somehow imagine that all those possible future divisions are already in effect there. We come to view the racecourse as already divided into infinitely many parts, and it is easy then for the paradoxes to take hold.

Even those later thinkers who did not share Aristotle's animosity towards the actual infinite tended to recognize the importance of his distinction. Often, though, Aristotle's reference to time was taken as a metaphor for something deeper and more abstract. This in turn usually proved to be something grammatical. Thus certain medieval thinkers distinguished between categorematic and syncategorematic uses of the word 'infinite'. Putting it very roughly, to use the word categorematically is to say that there is something with a property that surpasses any finite measure; to use the word syncategorematically is to say that, given any finite measure, there is something with a property that surpasses it. In the former case the infinite has to be instantiated 'all at once'. In the latter case it does not.

The categorematic-syncategorematic distinction heralds another distinction, whose importance to the infinite is hard to exaggerate. This is the distinction between saying that there is something of kind *X* to which each thing of kind *Y* stands in relation *R*, and saying that each thing of kind *Y* stands in relation *R* to something of kind *X* (not necessarily the same thing each time). This is referred to below as the 'Scope Distinction' (see Scope).

But Aristotle himself was not thinking in these very abstract terms. He took the references to time in his own account of the actual-potential distinction quite literally, and this gave rise to his most serious difficulty. He held that time (unlike space) is infinite. He also held that time involves constant activity, as exemplified in the revolution of the heavens. When our attention is focused on the future, there is no obvious problem with this. Past revolutions, however, because they are past, seem to have an infinitude which is by now completely given to us, and hence which is actual. This difficulty, in various different guises, has been a continual aggravation for philosophers who have wanted to see the infinite in broadly Aristotelian terms.

3 The rationalists and the empiricists

For over two thousand years Aristotle's conception of the infinite was regarded as orthodoxy. Often this conception was motivated by a kind of empiricism: the actual infinite was spurned on the grounds that we can never encounter it in experience. But does the potential infinite fare any better in this respect? Is experience of an infinitude that is given over time any less problematic than experience of an infinitude that is given all at once? The more extreme of the British empiricists were hostile to the infinite in all its guises. Where Aristotle had felt able to accept that space and time were infinitely divisible, Berkeley and Hume denied even that. They thought that the concept of the infinite was one that we could, and should, do without (see Empiricism).

This was partly a backlash against their rationalist predecessors. The rationalists had argued that we could form an

idea of the infinite, even though we could neither experience it nor imagine it. They thought that this idea was an innate one, and that it constituted, or helped to constitute, a vital insight into reality. They did not see any difficulty in this view. As Descartes put it, the fact that we cannot grasp the infinite does not preclude our touching it with our thoughts, any more than the fact that we cannot grasp a mountain precludes our touching it (see Rationalism §2).

Descartes believed that our idea of the infinite had been implanted in our minds by God (see Descartes, R. §6). Indeed this was the basis of one of his proofs of God's existence. Only a truly infinite being, Descartes argued, *could* have implanted such an idea in our minds. Note here the assimilation of the infinite to the divine: this was a legacy of medieval thought which is nowadays quite commonplace. But when the assimilation was first made, at the end of antiquity - most famously, by the Neo-Platonist Plotinus-it marked something of a turning point in the history of thought about the infinite (see Plotinus §§3, 4). Until then there had been a tendency to hear 'infinite' as a derogatory term. Henceforth, it was quite the opposite.

The empiricists, meanwhile, needed to defend their rejection of the infinite against the charge that it invalidated contemporary mathematics. They had more or less sophisticated ways of doing this, though in the case of geometry, where the problem was at its most acute, Hume took the rather cavalier step of simply denying certain crucial principles which mathematicians took for granted. (Berkeley's chief concern was with the use of infinitesimals in the recently invented calculus. In fact, his reservations were perfectly justified: it was a century before they were properly addressed.)

4 Kant

Kant played his characteristic role of conciliator in the debate on the infinite (see Kant §§2, 5, 8). He had an empiricist scepticism about the infinite, based on the fact that we cannot directly experience it. Nevertheless, he sided with the rationalists by insisting that there are certain formal or structural features of what we experience, which are accessible a priori and which *do* involve the infinite. Thus he thought that space and time were infinite (both in the sense of being infinitely extended and in the sense of being infinitely divisible): it is written into the form of whatever we experience that there can also be experience of how things are further out, further in, earlier or later. These, on Kant's view, were mathematical truths, a priori and unassailable.

But there is a question about how the topology of space and time *can* be a priori. Kant's celebrated reply was that space and time are not features of 'things in themselves'; they are part of an a priori framework which we contribute to our experience of things. What then of the *contents* of space and time, the physical universe as a whole? This was different. Kant did not think that what was physical was constructed a priori. Nor, on the other hand, did he think that it was ultimately real, that is to say real in a way that transcends any possible access we have to it. It had no features, on Kant's view, that exceed what we are capable of grasping through experience. So here the concept of the infinite did resist application. It still had what Kant regarded as a legitimate *regulative* use. That is, we could proceed *as if* the physical universe as a whole were infinite, thereby encouraging ourselves never to give up in our explorations. But we ultimately had no way of making sense of such infinitude. Kant was forced to take an extreme empiricist line by denying that the physical universe as a whole is infinitely big, that it has infinitely many parts and, going this time beyond Aristotle (thus bypassing the difficulty that had beset Aristotle himself), that it is infinitely old.

However, there was a dilemma. Kant was also forced to deny that the physical universe is *finite* in each of these three respects. Apart from anything else, to postulate infinite, empty space or time beyond the confines of the physical universe is itself to postulate that which exceeds what we are capable of grasping through experience.

This dilemma looks acute. Kant himself presented it in the form of a pair of 'antinomies'. These antinomies consisted of the principal arguments against the physical universe's being infinite in each of the specified respects, and the principal arguments against its being finite. But he believed that the dilemma contained the seeds of its own solution. If what is physical is not ultimately real - if there is no more to it than what we are capable of experiencing - then we are at liberty to deny that there is any such thing as the physical universe as a whole. There are only the finite physical things that are accessible to us through experience. The physical universe as a whole is neither infinite nor finite. It does not exist.

Kant's solution involved him in a direct application of the Scope Distinction (see §2 above). On the one hand he

affirmed that any finite physical thing is contained within something physical. On the other hand he denied that there is something physical within which any finite physical thing is contained. Both of these, the affirmation and the denial, were grounded in the fact that there is nothing we can identify in space and time such that we cannot identify more. This is fundamentally a fact about us: the fact that we are finite. Our identifications are always incomplete. What Kant added, in an idealist vein, was that what we cannot identify does not exist. Here, as in so many other places, we see how deeply involved with human finitude Kant's philosophy was, and how seriously he took it.

5 Post-Kantian metaphysics of the infinite

Metaphysical thought about the infinite since Kant has continued to be just as deeply involved with human finitude. Existentialists in particular have been greatly exercised by it, especially in its guise of mortality. But they have also for the most part recognized an element of the infinite within us. This too is Kantian. Kant believed that we are free rational agents, and that when our agency is properly exercised, it has an unconditioned autonomy that bears all the hallmarks of the truly infinite. For Kant, this was something which exalts us. But for many of the existentialists, still preoccupied with the fundamental fact of human finitude, it is something which is responsible for the deepest tensions within us, and thus for the absurdity of human existence (see Existentialism §2).

Hegel agreed with Kant that the truly infinite is to be found in the free exercise of reason (see Hegel, G.W.F. §8). But he took this further than Kant. He argued that reason is the infinite ground of everything. Everything that happens, on Hegel's view, can be understood as the activity of a kind of world-spirit, and this spirit *is* reason.

This led Hegel to a very non-Aristotelian conception of the infinite. For Hegel, the infinite was the complete, the whole, the unified. Aristotle's conception of the infinite as the never-ending was in Hegel's view quite wrong. He explained this conception as arising from our finite attempts to assimilate the truly infinite. And he described Aristotelian infinity as a 'spurious', or 'bad', infinity - a mere succession of finite elements, each bounded by the next, but never complete and never properly held together in unity. Such 'infinitude' seemed to Hegel at turns nightmarish, then bizarre, then simply tedious, but always a pale, inadequate reflection of the truly infinite.

6 Modern mathematics of the infinite

Despite Kant's influence on Hegel, and despite his own commitment to infinite reason (as well as to infinite space), Kant certainly helped to propagate the Aristotelian tradition of treating the actual infinite with hostility and suspicion. As this tradition prevailed, the actual infinite came increasingly to be understood in the more general, non-temporal sense indicated in §2 above. Eventually, exception was being taken to any categorematic use of the word 'infinite'. The most serious challenge to this tradition, at least in a mathematical context, was not mounted until the nineteenth century, by Cantor, whose mathematical contribution to this topic is unsurpassed (see Cantor, G.).

Objections to the actual infinite had tended to be of two kinds. The first kind we have already seen: objections based on the fact that we can never encounter the actual infinite in experience. Objections of the second kind were based on the paradoxes to which the actual infinite gives rise. These paradoxes fall into two groups. The first group consists of Zeno's paradoxes and their variants. By the time Cantor was writing, however, the calculus (which had then reached full maturity) had done a great deal to mitigate these. Of more concern by then were the paradoxes in the second group, which had been known since medieval times. These were paradoxes of equinumerosity. They derive from the following principle: if (and only if) it is possible to pair off all the members of one set with all those of another, then the two sets must have just as many members as each other. For example, in a non-polygamous society, there must be just as many husbands as wives. This principle looks incontestable. However, if it is applied to infinite sets, it seems to flout Euclid's notion that the whole is greater than the part. For instance, it is possible to pair off all the positive integers with those that are even: 1 with 2, 2 with 4, 3 with 6 and so on.

Cantor accepted this principle. And, consistently with that, he accepted that there are just as many even positive integers as there are positive integers altogether. Far from being worried by this, he defined precisely what is going on in such cases, and then incorporated his definitions into a coherent, systematic and rigorous theory of the actual infinite, ready to be laid before any sceptical gaze.

It might be expected that, on this understanding, all infinite sets are the same size. (If they are, that is not unduly paradoxical.) But much of the revolutionary impact of Cantor's work came in his demonstration that they are not. There are different infinite sizes. This is a consequence of what is known as Cantor's theorem: no set, and in particular no infinite set, has as many members as it has subsets. In other words, no set is as big as the set of its subsets. If it were, then it would be possible to pair off all its members with all its subsets. But this is not possible. Suppose there *were* such a pairing and consider the set of members paired off with subsets not containing them. Whichever member was paired off with *this* subset would belong to it if and only if it did not belong to it (see Cantor's theorem).

In the course of developing these ideas, Cantor laid down some of the basic principles of the set theory which underlay them; he devised precise methods for measuring how big infinite sets are; and he formulated ways of calculating with these measures. In short, he established transfinite arithmetic.

Even so, there are many who remain suspicious of his work and who continue to think of the infinite in broadly Aristotelian terms. Cantor himself was forced to admit that there are some collections, including the collection of all things, which are *so* big that they cannot be assigned any determinate magnitude (their members cannot be given 'all at once'). Concerning such collections, he even sometimes said that they are 'truly' infinite. There is in fact a real irony here: Cantor's work can in many ways be regarded as corroborating Aristotelian orthodoxy.

Brouwer believed that Cantor had gone wrong in not showing sufficient respect for the first kind of objection to the actual infinite: that we cannot encounter it in experience. All Cantor had done, in Brouwer's view, was to demonstrate certain tricks that can be played with (finite) symbols, without addressing the question of how these tricks answer to experience. The relevant experience here - the experience to which any meaningful mathematical statement must answer, according to Brouwer and other members of his intuitionistic school - is our experience of time. It is by recognizing the possibility of separating time into parts, and then indefinitely repeating that operation over time, that we arrive at our idea of the infinite. And such infinitude is potential, not actual - in the most literal sense (see Intuitionism §1).

There was a very different critique of Cantor's ideas in the work of Wittgenstein, though it led to similar results (see Wittgenstein §14). Wittgenstein believed that insufficient attention had been paid (at least by those interpreting Cantor's work, if not by Cantor himself) to what he called the 'grammar' of the infinite, that is to certain fundamental constraints on what could count as a meaningful use of the vocabulary associated with infinity. In effect, Wittgenstein argued that the word 'infinite' could not be used categorematically.

7 Human finitude

Problems about the infinite, we have seen, are grounded in our own finitude. On the one hand our finitude prevents us from being able to think of anything, including the whole of reality, as truly infinite. On the other hand it also prevents us from being able to think of anything finite - anything to that extent within our grasp - as the whole of reality. One way to reconcile these would be to deny that there is any such thing as the whole of reality and to argue that there are only bits of reality, each a part of some other. Here once again we see application of the Scope Distinction: every bit of reality is a part of something, but there is nothing of which every bit of reality is a part. Aristotle, Kant and even to an extent Cantor played out variations on this theme.

But one of the most pressing questions of philosophy still remains: in what exactly does our finitude consist? Some of the most striking features of that finitude are conditioned by our temporality. In particular, of course, there is the fact of our death. How are we to view death? Among the many subsidiary questions that this raises, there are two in particular which are superficially equivalent but between which it is important to distinguish. Putting them in the crudest possible terms (their refinement would be a large part of addressing them): (1) Is death a 'bad thing'? (2) Would immortality be preferable to mortality?

It can easily look as if these questions must receive the same answer. True, no sooner does one begin refining them than one sees all sorts of ways in which a full, qualified response to one can differ from a full, qualified response to the other. But it is in any case important to see how, even at this crude level, there is scope for answering 'yes' and 'no' respectively. Putting it very roughly, death is a bad thing because it closes off possibilities, but immortality would not be preferable to mortality because mortality is what gives life its most basic structure and, therewith, the possibility of meaning.

To answer ‘yes’ to (1) and ‘no’ to (2) in this way is once again to invoke the Scope Distinction. It is to affirm that at each time there is reason to carry on living for longer, while denying that there is reason to carry on living forever. Meaning, for self-conscious beings such as us, can extend further than any given limits. But it cannot extend further than them all.

If it is true that, in some sense, at some level and with all the myriad qualifications that are called for, the answer to (1) is ‘yes’ and the answer to (2) is ‘no’, then, coherent though that is, it points to a basic conflict in us: while it would not be good never to die, it is nevertheless never good to die. That conflict is one of the tragedies of human existence. It is also a version of the original conflict which underlies all our attempts to come to terms with the infinite. In thinking about the infinite, we are thinking, at a very deep level, about ourselves.

Information technology and ethics

Information technology ethics is the study of the ethical issues arising out of the use and development of electronic technologies. Its goal is to identify and formulate answers to questions about the moral basis of individual responsibilities and actions, as well as the moral underpinnings of public policy.

Information technology ethics raises new and unique moral problems because information technology itself has brought about dramatic social, political, and conceptual change. Because information technology affects not only how we do things but how we think about them, it challenges some of the basic organizing concepts of moral and political philosophy such as property, privacy, the distribution of power, basic liberties and moral responsibility.

Specific questions include the following. What are the moral responsibilities of computer professionals? Who is to blame when computer software failure causes harm? Is computer hacking immoral? Is it immoral to make unauthorized copies of software? Questions related to public policy include: what constitutes just policy with respect to freedom of speech, association, and the exercise of other civil liberties over computer networks? What determines the extent and limits of property rights over computer software and electronic information? What policies adequately protect a right to privacy?

The list of questions shifts in response to developments in information technology. One noteworthy example is the rise in prominence of questions about communication and information in response to the explosive growth of high-speed digital networks. This shift has subsumed the field commonly called 'computer ethics' under the broader rubric of 'information technology ethics'.

1 The philosophical study of information technology ethics

Information technology gives rise to distinctive ethical questions. These questions challenge traditional moral concepts such as property, privacy, and responsibility, as described below by John Perry Barlow:

> Imagine a place where trespassers leave no footprints, where goods can be stolen an infinite number of times and yet remain in the possession of their original owners, where businesses you never heard of can own the history of your personal affairs, where only children feel completely at home, where the physics is that of thought rather than things, and where everyone is as virtual as the shadows in Plato's cave.
>
> (1991: 23)

In an influential essay, 'What is Computer Ethics?' (1985), James Moor characterized the challenge as a 'conceptual vacuum'. The vacuum is generated when ethical problems raised by information technology are inaccessible to concepts and principles of traditional theory (see Morality and ethics). For example, Barlow's goods that 'can be stolen an infinite number of times' challenge a traditional understanding of property (see §2). In order to resolve problems in information technology ethics, according to Moor, one must not only deliberate about values, but also fill the conceptual vacuum; that is, one must develop ethical concepts and principles so that they cover novel situations. Philosophical work in the area of information technology ethics has been drawn particularly to these problems.

Below, three examples of problems calling for conceptual re-examination are discussed: ownership of computer software and digital information; privacy in the face of information technology; and risks and responsibilities in an age of computerization. Each has attracted considerable attention from philosophers and others writing about the social, ethical, and political impacts of information technology.

2 Property and information technology

Ownership of computer software and of digitalized information is a controversial matter. On the question of ownership over computer software some, like the computer scientist Richard Stallman, have argued that private ownership is morally indefensible. They contend that social welfare and progress in the field of computer science are both better served by allowing the free flow of ideas than by protecting the special interests of corporate and commercial developers with strong property rights (see Property). Like laws of physics and mathematical theorems, computer programs ought to remain in the public domain. A system of rewards and incentives could be

devised, even in the absence of property rights, to motivate programmers to continue producing good work.

Most oppose Stallman's position in favour of at least some form and some degree of private ownership. They diverge, however, over the nature and extent of these ownership rights, puzzling over whether the existing legal framework for protecting intellectual ownership is appropriate to the unique metaphysical character of software. Some contend that one or another of the traditional categories of copyright and patent can and ought to be extended to cover software; others contend that a new *sui generis* form of ownership ought to be devised especially for it.

The growth of global, high-speed networks raises yet a different set of ownership issues, not only about computer programs but about all information in digital form, including computerized databases, creative works of writing and music, visual images, even computerized mailing lists and records of computerized transactions. Many have held that the electronic medium poses both a practical challenge to the exercise of traditional property rights, as well as a fundamental challenge to the very idea of ownership. These sceptics say that the digital electronic medium is importantly different because information can be reached via networks virtually instantaneously by vast numbers of people; it can be transmitted and copied with no deterioration in quality; and can be used and enjoyed by others without reducing access by owners. Some see this as a practical problem only. In time, the technical means will be devised to enable owners of digitally stored work to control access to it and exact payment. Others believe that applying old ideas of ownership to this new form of property is not only practically difficult, but morally indefensible. They suggest that society will be able to reap the full benefits of digital technology only by discarding the constraints of traditional intellectual ownership and encouraging the free flow of ideas and information. Strong proprietary holds may give a stranglehold to a few wealthy and powerful individuals over a valuable social resource and may even obstruct the right to free exchange of ideas by limiting quotation of copyrighted sources.

3 Privacy and information technology

Information technology enables the storage, retrieval, manipulation and communication of vast amounts of information. When the information is about persons, this raises serious and perplexing questions about personal privacy (see Privacy).

A great deal has been written about the effects of information technology on privacy. These works, which consider practical questions of immediate policy as well as theoretical questions about the moral foundations of privacy, have concentrated on two broadly defined areas. One deals with databases and 'information privacy', the other with electronic networks and 'communications privacy'.

Most discussions about information privacy concede that if individuals choose to live social lives in a civil society information about them is needed both for the effective running of government and for normal personal dealings. The type and extent of information required remains controversial. Information technology has made the question ever more urgent because of its capacities for storing and using information. Enhanced organization, communication, and retrieval mean that more information can be obtained and more sources tapped. No longer can we count on the *de facto* protections of privacy offered not only by the limitations of human memory but by inefficiencies in record-keeping and information-gathering practices in times before computers were commonly used for this.

In the 1960s, the greatest concern was with the role of governments in creating and using databases about citizens. Although record-keeping was not new to government, computerized records vastly enhanced the degree to which individuals could be tracked. Databases replaced existing paper records, multiplying in scope and magnitude as government agencies eagerly conceived new uses for them. The benefits of computerized databases were clear: greater efficiency, fairer allocation of benefits, and more effective control of crime, among others. Critics, by contrast, brandishing sinister images of 'Big Brother' from George Orwell's novel, *Nineteen Eighty-Four*, urged strict limits. They warned that unchecked collection of data threatened the privacy of individuals, as well as their autonomy and liberty (see Freedom and liberty). Through computerized databases, a government could acquire inordinate power over its citizens.

One way of placing limits is through legislation. In the United States, for example, the Privacy Protection Act of 1974 prohibited a centralized, comprehensive database, secret databases, and databases whose function is not

explicitly stated and justified. Other countries have gone further, creating agencies with powers to regulate and enforce privacy protection in both government and the private sector. Nevertheless, many critics maintain that legislation has not gone far enough in protecting privacy.

As a consequence of technical improvements, greater ease of use, and a drop in prices, the private sector has played a growing role in creating personal databases. Information about persons has become a commodity of great value. Databases include comprehensive records of an individual's lifetime activities held by companies such as credit reporting agencies, medical insurance and mail order companies, as well as specialized databases containing one or two records. Because, in the private sector, political autonomy is not a driving force, the strength of the moral claims of privacy are less clear. One formulation of the dispute pits the rights of database subjects whose data is held frequently without their knowledge and against their will, against the rights claimed by owners of databases to create these databases and profit from them (see Rights).

Philosophical discussion of privacy, suffering from Moor's 'conceptual vacuum', offers only partial insight. The connection some philosophers have demonstrated between personality development, autonomy, intimacy and liberty, on the one hand, and privacy, on the other, has helped justify special protection for confidential information and against invasive means of acquiring information. Philosophical images of privacy, however, remain insufficiently richly textured to draw fine distinctions between a general conception of morally allowable versus morally reprehensible intrusions on privacy.

On the separate question of communications privacy, discussion has focused on public policy. Some argue that it is reasonable to expect the very highest degrees of privacy, guaranteed by unlimited access to encryption technology. Others place interests, such as law enforcement and accountability for communications, above privacy. Progress in this area is likely to involve careful balancing of these competing interests and claims.

4 Risk and responsibility

As with other technologies, information technology introduces a risk of harm as a result of design, system failure or abuse. Because information technology is used so widely, such harm may be extensive and range from mere inconvenience to loss of wealth or even life, from loss of property to loss of reputation and peace of mind. Specialists in the field of computer system reliability have argued that the unique character of computer technology makes it dangerous in unique ways. 'Small' errors which are hard to detect can lead to disastrous outcomes; the enormous complexity of computer systems makes them opaque even to those who have created their components. Where security is not strong, information systems are attractive targets of abuse. The usual philosophical and moral problems of risk apply to information technology as well (see Risk).

Closely related to the problem of risk is that of responsibility (see Responsibility). One set of questions about responsibility looks at the professional responsibility of the producers of information technology, including computer scientists, programmers, and engineers (see Engineering and ethics; Professional ethics). Themes raised in connection with computing overlap substantially with those prevalent in the context of other professions, such as the special responsibilities and privileges of computer professionals, the efficacy of codes of ethics as a means both to encourage and to enforce ethical behaviour, the problem of conflicting loyalties to clients, employers and society at large, and the duty of professional honesty. One consideration not typically an issue with traditional professions such as law and medicine is whether computer professionals are professionals in the full-blown sense at all.

Another set of questions about responsibility is concerned with moral blameworthiness for harms (see Praise and blame). This is not an area unique to information technology ethics, but the technology makes an already thorny issue more complex. A tendency to accept the presence of errors (known as 'bugs') as a normal part of software because they are ubiquitous means they may not be considered as worthy of blame. Furthermore, because of the mystique of computers as intelligent machines, which carry out tasks performed previously by humans in positions of responsibility, there is a tendency to absolve humans from blame in computer-related incidents. Finally, because computer systems and the institutions responsible for producing them are large and complex, blame is easily obscured.

The advent of computer networks raises another set of issues mainly having to do with harms caused by certain uses and abuses of information. Examples include defamatory, offensive and abusive speech and unauthorized

access to proprietary information and software. In response, philosophers, legal theorists, and social commentators have discussed morally and legally defensible lines of responsibility for these actions.

5 Other issues

Balancing the value of answerability for harms are other, sometimes conflicting, moral and political values, including civil liberties such as the freedoms of speech and association, and the right to anonymity (see Freedom of speech). Allowing users of computer networks to post anonymous notices on electronic bulletin boards, for example, creates the possibility of harmful speech for which there is no direct recourse. In another case, free association on-line enables the gathering of groups with immoral intent.

Also of considerable interest to computer ethics and computer law are activities known colloquially as ‘hacking’ and ‘cracking’. These activities range from harmless pranks to unauthorized entry into computer systems to serious destruction of systems and data. Responses to hacking are varied. Some judge it immoral and say it should be outlawed, others not only tolerate forms of hacking that do not result in egregious harm but consider it worthy of both technical and ideological respect. They sympathize with the position frequently expressed by hackers that computing ought to be free and accessible and not hoarded by a privileged few.

The discussion of hacking ties into broader questions of distributive justice (see Justice). Many commentators argue that just societies, in recognition of information technology as a substantial good, ought to guarantee to their citizens reasonable and equitable access to its benefits.

Another important approach to information technology ethics, distinct from the philosophical approach described in this entry, carves the area into quite different categories. It is organized around contexts rather than moral issues. Researchers taking this approach have, for example, examined the effects of computing on the workplace, on education, on social power and democracy, on communication, on information science, on cultures and on communities. Their work is descriptive as well as normative.

Information theory

Information theory was established in 1948 by Claude Shannon as a statistical analysis of factors pertaining to the transmission of messages through communication channels. Among basic concepts defined within the theory are information (the amount of uncertainty removed by the occurrence of an event), entropy (the average amount of information represented by events at the source of a channel), and equivocation (the 'noise' that impedes faithful transmission of a message through a channel). Information theory has proved essential to the development of space probes, high-speed computing machinery and modern communication systems.

The information studied by Shannon is sharply distinct from information in the sense of knowledge or of propositional content. It is also distinct from most uses of the term in the popular press ('information retrieval', 'information processing', 'information highway', and so on). While Shannon's work has strongly influenced academic psychology and philosophy, its reception in these disciplines has been largely impressionistic. A major problem for contemporary philosophy is to relate the statistical conceptions of information theory to information in the semantic sense of knowledge and content.

1 The technical concept of information

Information theory (less commonly called 'statistical communication theory') was first formulated systematically by Claude Shannon in 1948, in his paper 'A Mathematical Theory of Communication' (see Sloane and Wyner 1993). Its conceptual basis, however, was provided by previous engineering studies of efficiency in the transmission of messages over electrical channels. In 1924 Harry Nyquist proposed a logarithmic measure of speed in the 'transmission of intelligence', and had shown that this variable depends both upon the speed of the signal and upon the number of different signal elements employed. R.V.L. Hartley used the same mathematical construct in 1928 as a quantitative measure of what he called 'information', and showed how this measure relates also to the frequency range of the transmitting medium. Shannon extended the theory to include other factors, such as the effects of noise, the statistical structure of the message and the reliability of the channel through which it is transmitted. His treatment was sufficiently rigorous to permit the derivation of several basic theorems that have proved essential to the design of present-day communication and computational systems.

The commonplace intuition upon which Hartley's measure was founded is that information is conveyed by relatively improbable events, and that the amount of information conveyed by an event (*E*) is inversely related to its probability. In order to make the information of associated events additive, the measure chosen was $\log 1/\mathrm{P}(E)$ - that is, the logarithm of the reciprocal of the initial probability of the event in question. This measure admits further specification, inasmuch as logarithms may be based on any positive number. Three different bases have been used in the literature. When the base chosen is ten, the quantity $\log_{10} 1/\mathrm{P}(E)$ is the unit of information, named a 'Hartley' in honour of the originator of the measure. Natural logarithms also have been used, with a unit called 'nat' for natural unit. Most commonly, however, logarithms to the base two are employed, with a unit called a 'bit' (for binary unit) following the usage of Shannon. One advantage of the latter is the intuitive understanding it provides of the mathematical measure $\log 1/\mathrm{P}(E)$: the number of bits of information represented in the occurrence of a given *E* is equal to the number of times its initial probability must be doubled to reach unity. Thus the occurrence of heads in the flip of an unbiased coin (50 per cent probable) would yield one bit of information, the occurrence of an event initially 25 per cent probable would yield two bits, that of an event initially 60 per cent probable would yield 0.74 bits, and so on. Another advantage of a measure based on logarithms to the base two is its convenient application to factors involved in the design of digital computers. Logarithms to the base two will be assumed in the remainder of this entry.

Information, in the sense (henceforth called 'info(t)') germane to technical information theory, is the quantity measured by $\log 1/\mathrm{P}(E)$. What is measured thereby is the difference between *E*'s initial probability and the probability of 100 per cent that marks its actual occurrence. The difference between a probability before occurrence of 25 per cent and a probability upon occurrence of 100 per cent, as noted above, is a quantity characterized by two bits of information. The information thus characterized is just the difference in probability involved. Insofar as events can be characterized as statistically more or less uncertain prior to occurrence, info(t) is sometimes defined also as the amount of uncertainty removed by the occurrence of *E*. This conception of info(t) as

the removal of statistical uncertainty is useful for interpreting the theory, but must be carefully guarded against psychological or 'subjective' connotations. Information in the relevant sense is entirely quantitative, and is defined with respect to a mathematical measure. Pending further discussion below, this in itself is enough to show that info(t) cannot be equated with either knowledge or semantic content.

2 Information channels

In its bare essentials, an information channel consists of two ensembles of statistically interrelated events. One is the *input ensemble*, consisting of events presented at the input of the channel. The other is the *output ensemble*, consisting of events at the terminus that are to some extent indicative of occurrences at the input. These two ensembles may be represented respectively as *A*, consisting of *n* symbols $a_1, a_2, \ldots, a_n$, and *B*, comprising *m* symbols $b_1, b_2, \ldots, b_m$. Both *A* and *B* are assumed to consist of mutually exclusive events, with combined probability of occurrence equal to unity. The relationship between input and output may then be described by a set of conditional probabilities $\mathrm{P}(b_j/a_i)$, specifying for each output event b_j the probability of its occurrence in association with each input event a_i. This set of conditional probabilities characterizes the *channel* itself, in distinction from its input and output ensembles.

A typical realization of an information channel is a telephone circuit connecting two modems, with events at the sender and the receiver constituting *A* and *B* respectively, and their association through a physical medium represented by an appropriate set of conditional probabilities. Further characterization of the circuit might mention such features as the medium of transmission (satellite, fibre optics, and so on), the intervening switching mechanisms, and the temporal lag between events at input and output. Such features, however, are not essential to an information channel, and may be replaced by others in an equivalent physical system. It is even conceivable that there might be information channels without physically connecting media, such as in communication by 'mental telepathy'. The only general requirement for an information channel is two ensembles related by conditional probabilities.

The quantity of info(t) represented by the occurrence of an event *a* with probability $\mathrm{P}(a)$ is $\log 1/\mathrm{P}(a)$. Unless all input events are equiprobable, this quantity will vary for different members of the input ensemble. The average amount of info(t) represented by occurrences within the input ensemble is the sum of the quantities $\log 1/\mathrm{P}(a)$ for individual events in *A* each multiplied by the probability of its occurrence. This average (which varies with different input distributions $\mathrm{P}(a)$) is called the *entropy* of *A*, and is commonly designated ' $\mathrm{H}(A)$'. If the members of *A* are statistically independent (a 'zero-memory' input), its entropy is given by the formula:

$$\mathrm{H}(A) = \textstyle\sum_A \mathrm{P}(a) \log 1/\mathrm{P}(a)$$

A corresponding average $\mathrm{H}(B)$ can be calculated for the ensemble of output events. In general, the closer the individual events within an ensemble approach equiprobability, the closer the entropy of that ensemble approaches maximum value.

The value of $\mathrm{H}(A)$ does not reflect the statistical interaction between *A* and *B* in an information channel. Because of this interaction, the probability of a given event's occurring in *A* may be affected by the occurrence of an event in *B*, and vice versa. $\mathrm{H}(A)$ thus is sometimes called the a priori entropy of *A*, in contrast to the a posteriori entropy of *A* conditional upon events in *B*. The a posteriori entropy of *A* given a particular b_j is the average info(t) represented by an event in *A* when b_j has occurred in *B*:

$$\mathrm{H}(A/b_j) = \textstyle\sum_A \mathrm{P}(a/b_j) \log 1/\mathrm{P}(a/b_j)$$

Summing $\mathrm{H}(A/b_j)$ for all b_j, we then have the average a posteriori entropy of *A*:

$$\mathrm{H}(A/B) = \textstyle\sum_B \mathrm{P}(b)\mathrm{H}(A/b)$$

$$= \textstyle\sum_B \mathrm{P}(b) \sum_A \mathrm{P}(a/b) \log 1/\mathrm{P}(a/b)$$

$$= \textstyle\sum_{A,B} (a,b) \log 1/\mathrm{P}(a/b)$$

$\mathrm{H}(A/B)$ is called the *equivocation* of *A* with respect to *B*. As this label suggests, the amount of uncertainty left in *A* given the occurrence of an event in *B* is a measure of the 'ambiguity' of *A* with respect to that event, where 'ambiguity' varies indirectly with the reliability of that event as an indication of events in *A*. The above equalities

show how the equivocation of *A* with respect to *B* may be conceived as the average 'ambiguity' of *A* with respect to events in *B*. If we think of *B* as capable of yielding 'information about' *A* in proportion to its general reliability, then that capacity is inversely proportionate to $\mathrm{H}(A/B)$.

There is an intuitive sense in which an information channel with low equivocation is characterized by a representation at the output of approximately the same occurrences as those presented at the input. Conversely, the higher a channel's equivocation, the less reliable are events at its output as representations of input occurrences. The capacity of a channel to convey info(t) thus varies inversely with the equivocation of input to output. This overall capacity also varies directly with the amount of info(t) that can be entered into the channel - that is, with the entropy of the input ensemble. The difference between the entropy of its input and the equivocation of its input with respect to the output thus measures the capacity of the channel as a reliable conveyor of info(t) given a particular input distribution $\mathrm{P}(a)$. This quantity

$$\mathrm{I}(A;B) = \mathrm{H}(A) - \mathrm{H}(A/B)$$

is called the *mutual information* of the information channel. *Channel capacity* in general is defined as the maximum of $\mathrm{I}(A;B)$ over all possible input distributions.

Barring limiting cases, an information channel is characterized by equivocation in either direction, which is to say that both $\mathrm{H}(A/B)$ and $\mathrm{H}(B/A)$ possess positive values. One limiting case is the *noiseless channel*, in which each event at the output indicates a single input event with perfect reliability. A noiseless channel is one with $\mathrm{H}(A/B) = 0$. A *deterministic channel*, on the other hand, is one in which each input event is associated invariably with a single event at the output, and in which accordingly $\mathrm{H}(B/A) = 0$. A channel that is noiseless from input to output thus is deterministic in the opposite direction, and of course vice versa.

3 Two basic theorems of information theory

Practical use of an information channel typically involves both a sender (a source) and a receiver, and communication systems are usually designed with the needs of these users in view. Among factors influencing the design of such systems are considerations of efficiency in the coding of the sender's message. If the anticipated use of a digital communication system is to transmit alphabetically expressed messages, for example, then a system must be devised for coding the letters of the (Latin) alphabet into binary digital form. One such system would employ progressive series of 1s in combination to mark the ordinal place of each letter in the alphabet ('1' for a, '11' for b, '111' for c, and so on), and with '0' to mark the end of a symbol. Simple calculations show that the code symbols assigned to letters in this system would average over thirteen digits in length. A much more efficient system would encode letters in terms of a progressive ordering of 1s and 0s in a five digit sequence ('00000' for a, '00001' for b, '00010' for c, …, '10000' for f, '10001' for g, and so on), with unambiguous decodability assured (independently of synchronization between input and output) by the fact that no complete symbol is a prefix of another symbol. The average symbol length in this system of course is five. One of Shannon's major results is the so-called 'noiseless coding theorem', which establishes limits in the efficiency of coding systems. According to this theorem, the average symbol length of a uniquely decodable coding system can be no less than the entropy of the message source (measured similarly to the input entropy). A special problem arises in the not uncommon case of a source that issues messages in a continuous (for example, not discrete) form, such as music and pictures involving variable pitch and colour. In order to code these messages in discrete binary symbols, their original form must be quantized into small discontinuous segments (as music is recorded on a compact disc). Shannon's noiseless coding theorem also quantifies the cost of fidelity in such transformations in terms of entropy characteristics of the quantized source.

Noise is constituted by any factor that contributes to equivocation $\mathrm{H}(A/B)$, and thus prevents a channel from being noiseless from input to output. Communication engineers have various devices available for reducing noise, including coding systems incorporating redundancy and other 'error correction' features. A simple example of the latter is sheer repetition, as when a specific code element (0 or 1) is transmitted several times in sequence. An unavoidable by-product of such an expedient, however, is an increase in the time required to transmit a given message. Another basic theorem (Shannon's second, also called the 'noisy channel coding theorem') relates requirements of error correction to channel capacity and rate of message transmission through the channel. In very general terms, what this theorem states is that a (sufficiently long) sequence of messages can be transmitted with

an error rate arbitrarily close to zero, as long as the rate of transmission is less than overall channel capacity.

4 The entropy of information theory related to that of thermodynamics

The entropy of an ensemble *A* can be expressed equivalently in the form:

$$\mathrm{H}(A) = -\sum_A \mathrm{P}(a) \log \mathrm{P}(a)$$

which bears an oft-noted similarity to Boltzmann's formulation of thermodynamic entropy (*S*):

$$S = k \log_n \mathrm{P}$$

Both H and *S* vary with the function $\log \mathrm{P}$, where *P* measures the probability of a given system state. Their difference in sign, however, indicates that they are inversely related. An intuitive grasp of this relationship may be provided in terms of the conception of thermodynamic entropy as departure from order. According to the second law of thermodynamics, a closed system tends through time to increase in entropy, which is to lose energy capable of doing work or (equivalently) to lose structure in its overall configuration (see Thermodynamics). Since order and structure are improbable conditions, this means that the detectable configurations (macrostates) in which the system actually exists from moment to moment become increasingly predictable, and that the initially improbable configurations (which provide structure and energy) become even less likely to occur. If we view the total set of possible macrostates (probable and improbable) as an ensemble with the properties of an information source, this means in turn that the possible configurations depart increasingly from equiprobability. Since an information source has maximum H when its states are equally probable, the result is that H decreases with an increase in *S*. This inverse relation between H and *S* has led some information theorists (for example, Brillouin 1962) to refer to info(t), along with energy and structure, as forms of negentropy.

Detailed technical discussions of the relation between H and *S* can be found in Brillouin and in Tribus (1961). An intriguing claim of the latter is that thermodynamics can be developed deductively from quantum physics by application of the methods of information theory.

5 Ramifications of philosophic interest

The term 'information' has various senses in ordinary discourse, including knowledge ('*N*'s information about birds comes from actual experience') and propositional content ('*N*'s report contained information that a golden eagle had been spotted'). Information in these senses has semantic features (call it 'info(s)'), such as reference and truth-value. In contrast with info(t), as already noted, info(s) is not quantitative and cannot be characterized mathematically. Another difference is that communication of info(s) is a three-term transaction, involving sender, receiver and intended referent, whereas the communication of info(t) in relevant respects requires only sender and receiver. Another way of putting this point of difference is that intention is not a factor in the description of channels for communicating info(t).

Despite the insistence of information theorists (including Shannon) from the start that info(t) has nothing to do with semantics, there have been persistent attempts by philosophers and cognitive psychologists to found theories of semantic content on an information-theoretic basis. Shortly following Shannon's original paper, the physicist D.M. MacKay initiated a series of publications purporting to show that information theory deals with representation (a semantic relation; see the bibliography in *Information, Mechanism and Meaning*, 1969). MacKay's purported results stand behind subsequent influential work in information-processing psychology (for example, that of D.E. Broadbent and W.R. Garner), and may be in part responsible for the assumption found in recent cognitive psychology that information theory itself provides a theory of info(s).

An independent approach to semantic issues through information theory among professional philosophers began with D.M. Armstrong (1968) and D.C. Dennett (1969). This essentially materialist approach yielded, in F.I. Dretske (1981), a clearly articulated account of how info(s) might be produced by certain causal (hence, non-information-theoretic) properties of info(t)-processing systems. Apart from their other merits, however, none of these studies maintains fidelity to a precise understanding of information theory as developed by Shannon. An attempt to found an account of info(s) on a precise understanding of Shannon's theory is pursued in K.M. Sayre (1976).

Information theory and epistemology

The mathematical theory of information (also called communication theory) defines a quantity called mutual information *that exists between a source, s, and receiver, r. Mutual information is a statistical construct, a quantity defined in terms of conditional probabilities between the events occurring at r and s. If what happens at r depends on what happens at s to some degree, then there is a communication 'channel' between r and s, and mutual information at r about s. If, on the other hand, the events at two points are statistically independent, there is zero mutual information.*

Philosophers and psychologists are attracted to information theory because of its potential as a useful tool in describing an organism's cognitive relations to the world. The attractions are especially great for those who seek a naturalistic account of knowledge, an account that avoids normative - and, therefore, scientifically unusable - ideas such as rational warrant, sufficient reason and adequate justification. According to this approach, philosophically problematic notions like evidence, knowledge, recognition and perception - perhaps even meaning - can be understood in communication terms. Perceptual knowledge, for instance, might best be rendered in terms of a brain (r) receiving mutual information about a worldly source (s) via sensory channels. When incoming signals carry appropriate information, suitably equipped brains 'decode' these signals, extract information and thereby come to know what is happening in the outside world. Perception becomes information-produced belief.

1 Objective information

The mathematical theory of information has its primary application to telecommunications systems. It deals exclusively with *amounts* of information, either the amount generated at a source - the more unlikely an event is the more information its occurrence generates - or the amount of mutual information existing between source and receiver. Mutual information between two points is just a useful measure of the statistical dependence of events occurring at these two points: the greater the independence between events occurring at *r* and *s*, the less mutual information there is between them (see Information theory).

If signals are understood to be information-carrying events (sounds, gestures, electric currents), then the mathematical theory is concerned with the statistical properties of these events, not with the information they happen to carry in any ordinary sense of the word 'information' (news or message). It is concerned with how probable or improbable these events are, not with what, if anything, they say or mean. For this reason it has sometimes been said that communication theory is not really a theory about information - *semantic* information - at all. There is some truth in this charge; mutual information is a statistical quantity and it must be carefully distinguished from the semantic content - the news or message - that events carry.

Nonetheless, though the theory is primarily concerned with the statistical properties of signals, not with the semantic information (if any) they carry, the statistical properties are relevant to a signal's capacity to carry semantic information. Unless there is, in a communication theory sense, a statistically reliable channel of communication between *s* and *r*, the signals reaching *r* from *s* cannot inform, tell or teach one what is happening at *s*. A broken instrument, one whose pointer (*r*) does not bear the right statistical relations to the quantity (*s*) it is supposed to measure, cannot convey semantic information about the value of that quantity. A broken clock cannot tell you the time of day even if it happens (coincidentally) to register the correct time. For the same reason, one receives little or no information from unpredictable liars even when they happen to be telling the truth. Hence, information theory, though not itself directly addressing semantic topics, does, it seems, formulate a possible objective condition on the flow of semantic information. No signal can carry semantic information unless it satisfies the appropriate statistical constraints of communication theory.

It is this fact about communication theory - that it can be interpreted as relating something important about the conditions that are needed for the transmission of information as ordinarily understood - that has tempted philosophers to use it in developing accounts of empirical knowledge. If coming to know *p* is equivalent to being 'informed' that *p*, and being informed that *p* is understood as a way of being made to believe that *p* by the information that *p*, then empirical knowledge is information-produced belief. If, in addition, information is taken to be constrained by, if not equivalent to, mutual information between world and believer, then one is close to having an objective theory of knowledge: knowing that *p* is being caused to believe that *p* by information-bearing signals

arriving over a channel of communication.

Information-based accounts of knowledge, perception, memory and so on are variants of reliability theories of knowledge (see Reliabilism). The basic idea behind such accounts of knowledge is that one knows if and only if one's belief - or (on some accounts) the evidence on which one's belief is based - exhibits a reliable connection with the conditions one believes to exist. Information theory is merely a convenient way of expressing these facts about the required reliability of the belief-formation process.

Information theory would not be useful in epistemology if it embodied - implicitly - the very same ideas that philosophers use it to analyse. If it turned out that the probability relations used by this theory to define information were themselves ideas that presupposed - either in definition or application - knowledge and meaning, then it would be circular to use mutual information as a tool to analyse knowledge and meaning. For this reason, it is important to understand that the 'mutual information' that epistemology borrows from communication theory is supposed to be an objective commodity, one whose existence is independent of our knowledge or understanding. The probabilities defining mutual information cannot, therefore, be what are called *subjective* probabilities, probabilities that depend on what people know or believe about the likelihood of events at *s* given events at *r* (see Probability theory and epistemology§1). If mutual information is to serve as a useful tool in epistemological and semantic studies, then it must be conceived of as an objective measure of correlation or lawful dependency between events. No one need ever know, understand or believe that such correlations exist for them - and, hence, for *mutual* information - to exist.

2 Pure and impure theories

If epistemological concepts like knowledge, justification and evidence are interpreted in informational terms, one can distinguish pure and impure versions of such interpretations. An impure theory of knowledge, for example, would contain a mixture of conditions on knowledge, some involving information (to know that *p* one must stand in the right informational relation to the fact that *p*), others, perhaps, involving subjective conditions (to know that *p*, one must also be subjectively justified in thinking that the appropriate informational relations exist). A pure theory, on the other hand, forgoes all subjective requirements (except belief) and identifies knowledge of the facts with beliefs that stand in the appropriate informational relations to the facts. A pure theory, for example, identifies perceptual knowledge with beliefs aroused by information-carrying sensations. Subjects need not know or be justified in believing that their sensations do convey the requisite information. All that a pure theory requires is that sensations, in fact, carry the right information. In order to know, by perceptual means, that something is moving, one need not know, or be justified in believing, that one is receiving information. All that is required is that one *be* receiving it.

A pure theory of knowledge, in this sense, is most plausible in the case of direct observational knowledge. It enjoys greatest plausibility here because one seldom troubles to determine *how* reliable sensations are - and, thus, how much mutual information they carry - before one trusts them to 'inform' (give one knowledge about) the world one lives in. We see, and we promptly believe; there is precious little (if any) conscious thought, reasoning, justification or inference that comes between the seeing and the believing. We classify the resulting beliefs as knowledge - in both ourselves and animals - as long as we are convinced that the sensory mechanisms are operating reliably, as long as we believe they are channels of mutual information. According to its advocates, then, this is a strong endorsement of informationally pure theories of knowledge. If we do not, in actual everyday practice, require more than information-caused belief, then ordinary everyday knowledge requires nothing more, it is nothing more, than information-caused belief.

Advocates of a pure theory of knowledge also argue that it represents the best answer - indeed, according to some, the *only* answer - to philosophical scepticism. If knowledge of the world required not only information about the world but also that one had to somehow justify the claim that one's senses were providing genuine information, then the philosophical sceptic would be right: knowledge of the world would be impossible. For the only way we have of getting the information that we are, in fact, getting genuine information through the senses is through the very senses whose reliability is in question. This is a circle from which there is no escape. You cannot expect instruments to provide information about their own reliability (see Scepticism §1).

Pure theories are at their weakest when applied to less direct forms of knowledge. When one comes to know that *p*

by reasoning and inference, by using informants, instruments, tests and procedures, it seems implausible to suppose that one needs no information about the channels through which information arrives. Knowledge that *p* may not require knowledge that one is getting genuine information about *p*, but an impure theorist will insist that it requires some evidence, reason or justification for thinking one's instruments, methods and informants are reliable (see Internalism and externalism in epistemology).

3 How much information is enough?

Since mutual information is a statistical quantity that comes in varying amounts, questions arise about how much of it is enough. Even cheap or badly calibrated instruments carry some mutual information about the quantities they are used to measure. Is it enough to know? Another way of putting this question is to ask how much mutual information a signal must carry about a condition at a source in order to carry the semantic information that that condition exists at the source.

Some philosophers have argued that perfect reliability is needed. If, given the sort of signals reaching *r* from source *s*, there is a chance, however small, that condition *q* rather than *p* exists at *s*, then the signals do not carry the information that *p* exists at *s* (though they might carry the information that *p* or *q* exists at *s*). The signals are equivocal - not reliable enough to enable someone at *r* to know that *p* exists at *s*. Others, assuming that such perfect reliability is seldom, if ever, achieved, have argued that to avoid scepticism, information and knowledge must be understood as requiring something less than a probability of 1. Otherwise, for any condition *p*, we would never get the information that *p* exists and, therefore (if knowledge requires information) never know that *p*.

Despite the apparent sceptical consequences of requiring perfect reliability for knowledge and information, there are theoretical reasons favouring this option. For if one could know that *p* when the informational sources are less than completely reliable, then knowledge would cease to 'add up' - one might know that *p* and know that *q* but fail to know that *p* and *q*. For suppose that a probability of only .98 was required to know. Then one might know that *p* (the probability of *p* being .98), know that *q* (probability also .98), but fail to know that *p* and *q* since the probability of *both* *p* and *q* is the product (.96) of their individual probabilities. This, however, seems like an unacceptable result. Knowledge (it is said) adds up: anyone who knows that *p* and knows that *q* *thereby* knows that *p* and *q*. Since the 'unacceptable' result occurs *whenever* the probability required for knowledge is less than 1, it seems that to avoid it, the probability required for knowledge must be set equal to 1.

For these and other reasons, some philosophers despair of finding general answers to questions about reliability conditions on knowledge. They argue that knowledge and semantic information are relative notions. What is *enough* depends on a context of inquiry. When a drug, if known to be safe, will be given to human infants, it takes more (mutual) information to know it is safe than it does when it will be administered to rats in a laboratory test. For the same reason, whether a newspaper contains semantic information about a death, for example, depends on whose death it is and what are the consequences of readers believing it.

Ingarden, Roman Witold (1893-1970)

Ingarden was a leading exponent of phenomenology and one of the most outstanding Polish philosophers. Representing an objectivist approach within phenomenology he stressed that phenomenology employs a variety of methods, according to the variety of objects, and aspires to achieve an original cognitive apprehension of these objects. Its aim is to reach the essence of an object by analysing the contents of appropriate ideas and to convey the results of this analysis in clear language. Ingarden applied his methods in many areas of philosophy. He developed a pluralist theory of being and an epistemology which makes it possible to practise this discipline in an undogmatic manner and to defend the value of human knowledge. In the theory of values he developed an inspiring approach to the analysis of traditionally problematic areas. He was best known for his work in aesthetics, in which he analysed the structure of various kinds of works of art, the nature of aesthetic experience, the cognition of works of art and the objective character of aesthetic values. In general, he gave phenomenology a lucid and precise shape.

In the interwar period Ingarden was the main opponent in Poland of the dominant Lwów-Warsaw School (Polish Analytic School), which had a minimalistic orientation. The main lines of his own investigations emerged largely as a result of his regular debates with Husserl, in particular those concerning Husserl's transcendental idealism. Ingarden's best-known work, Das literarische Kunstwerk (The Literary Work of Art) (1931a) has its origins in this debate.

1 Life

Roman Ingarden was born in 1893 in Cracow and died there in 1970. He studied in Lwów and Göttingen (1912-14), taking philosophy under Edmund Husserl, mathematics under David Hilbert and psychology under G.E. Müller. In 1916 he followed Husserl to Freiburg, where in 1918 he took a doctor's degree, then taught for some time at high schools in Lublin, Toruńand Lwów. He received his habilitation at Lwów University in June 1924, was appointed *dozent* there in 1925, and after Twardowski's retirement obtained the chair of philosophy in 1933. He stayed in Lwów until 1941; during the Soviet occupation he did not teach philosophy but German studies. He was also active in the Polish underground University. From 1945 to 1950, and from 1957 until his retirement in 1963, he was professor at the Jagiellonian University in Cracow.

Most of Ingarden's students from his Lwów period were either killed during the Second World War or became Marxists. After the war another group of his followers emerged in Cracow, though after Ingarden's death many of them questioned elements of his thought, some developing it, some reshaping it and others rejecting it.

2 Ontology

Ingarden held that philosophy divides into ontology and metaphysics. Ontology is an autonomous discipline in which we discover and establish the necessary connections between pure ideal qualities by intuitive analysis of the contents of ideas. This is an indispensable preparation for metaphysics, which aims to elucidate the necessary truths of factual existence. Each section of philosophy - theory of knowledge, philosophy of man, philosophy of nature and so on - has ontological and metaphysical aspects.

Ingarden argues that every being is a triple unity of matter (contents), form (of the matter) and existence (in a certain mode). Accordingly, ontology as a whole is divided into material, formal and existential ontology. Existence is neither a property nor one of the material or formal moments of an object; it is always the existence *of something* and what exists determines by its essence a mode of being which belongs to it. Modes of being are constituted from existential 'moments', of which Ingarden distinguishes the following opposite pairs: originality-derivativity, autonomy-heteronomy, distinctiveness-connectiveness and independence-dependence. Taking into account the modes of being thus constituted, there are four basic spheres of being: absolute (supratemporal), ideal (timeless), real (temporal - it has the most numerous forms) and purely intentional (atemporal, sometimes seemingly in time). Ingarden also draws a distinction between three domains: pure ideal qualities, ideas and individual objects. Each individual object is formally a subject of properties whose identity is determined by its constitutive nature. Individual objects of higher order, such as organisms, may be superstructured on autonomous individual objects. Ideas and purely intentional beings have a two-sided formal

constitution - besides their own structure they also have contents (in the case of ideas it is constituted by constants and variables, and in the case of purely intentional beings by places of indeterminateness).

Analyses of being in time, of the stream of consciousness and of the world show that their existence is derivative and depends on their relation to original (absolute) being. The foundation of being is placed either in its essence (and ultimately in the content of some idea) or is purely factual in its character. In his analysis of the controversy over the existence of the world, Ingarden first formulates Husserl's transcendental starting point, and then demonstrates and states precisely its assumptions concerning the two elements of initial relation: the real world and the stream of consciousness, together with a subject which belongs to it (pure ego). These considerations lead Ingarden to reject both Husserl's solution and his way of setting the question.

What is real appears in three temporal phases: the future, the present and the past. Objects determined in time include objects enduring in time, processes and events. A human being is an object enduring in time and constituted by a soul, which comprises an ego together with a stream of consciousness, and a body (with a subsystem constituting 'the gate of consciousness'). Living on the border of two spheres, the real (nature, animality), and the ideal (values), human beings create a third sphere of culture. Thus their need to transcend this fragility by a process of self-formation that is subordinated to values makes them prone to tragedy.

3 Aesthetics

Ingarden gave special attention to questions concerning aesthetic and moral values. Art plays a significant role in human life, and Ingarden develops a complex theory of works of art: a work of art exists in a purely intentional manner, though on the basis of some physical foundation of its identity; it is formally two-sided (it has some contents, for example, a represented world in certain types of arts); it can be analysed in the respect of its phases and its 'layers'; it is given (in its contents) in quasi-perception or in imagining ('imagining-thinking'); if it is of linguistic character (such as a literary work), sentences in it form quasi-propositions, and not propositions in the sense of logic; because of its schematic character it allows for various interpretations, but its main aim is to make aesthetic interpretation (the construction of an aesthetic object) possible. Ingarden draws a distinction between artistic values, which belong to the work of art, and aesthetic values, which belong to the aesthetic object. A succesful work of art may realize not only an aesthetic value but, in connection with this value, it may also 'flare-up' with a 'metaphysical' quality (that is, an existentially significant quality) and make visible an essential connection between some concrete situation in life (embodied in the represented world) and an existential quality or qualities. Aesthetic experience has many phases and it consists of various factors - perceptual, intellectual, imaginative, emotional and volitional, for instance. In a developed aesthetic experience there are four phases: the preliminary emotion, the adoption of an aesthetic attitude, aesthetic interpretation (the construction of an aesthetic object), and the approval or disapproval of the aesthetic value apparent in the aesthetic object. Ingarden maintains that there are many different aesthetic values (see Art, value of §1).

4 Conclusion

Ingarden contributed to many areas of philosophy, but his most significant achievements include the following: the formulation of conditions for practising an autonomous theory of knowledge, emphasizing the role in it of the immediate 'awareness of an experience'; the distinction between a 'mode of being' and an 'existential moment'; a new theory of ideas as two-sided structures (that is, containing 'constants' and 'variables') which allows him to refute arguments against 'general objects' as self-contradictory; an extensive analysis of the controversy over the existence of the external world as well as an analysis of Husserl's arguments on this subject; an account of the foundations of aesthetics by detailed studies of the structure and modes of existence of the main types of works of art and of the ways in which we perceive them (the theory of aesthetic experience); and the formulation of the concept of a relatively isolated object and its application to the theory of the physical world, the theory of organisms and the problem of the freedom of human action. Ingarden's understanding of the philosophy of language also led him to make a significant attack on the Vienna Circle in Prague in 1934. It was in aesthetics, however, that his influence proved to be deepest and most durable.

Inge, William Ralph (1860-1954)

Inge, a philosopher and theologian, was a Christian Platonist. Platonic philosophy emphasized knowledge of necessary truths that it held to be grounded in abstract objects; its deity was a designer limited by the properties of a matter it did not create. Christian theology emphasizes a God who, both Creator and Providence, became incarnate in Jesus Christ. For Platonism, nothing historical could have ultimate significance or importance; for Christianity, the birth, death, and resurrection of Christ have ultimate significance. As his thought developed, Inge increasingly was able to retain much of Platonism while slowly coming to accept the consequences of the Christian emphasis on history.

William Ralph Inge was born in 1860 in Crayke, Yorkshire, and educated at Eton and Cambridge. He was a Fellow of Hertford College, Oxford, from 1889 to 1905, vicar of All Saints' Church, Knightsbridge, from 1905 to 1907, and became a professor of divinity at Cambridge in 1907. In 1911, he was appointed Dean of St Paul's Cathedral, from which he retired in 1934. The remaining twenty years of his life were spent in writing and reflection. He was influenced by the British neo-Hegelians (T.H. Green, Edward Caird, John Caird, F.H. Bradley and Bernard Bosanquet) and, especially, by Baron Friedrich von Hügel, whose emphasis on divine transcendence Inge entirely embraced. A bombastic speaker and writer, always a source of 'good copy', he defined pragmatism as an act of violence exercised by the will upon the intellect to make it accept what we find it helpful to believe, and replied by postcard to an invitation to an elaborate ecclesiastical ceremony planned in his honour, 'What do you think I retired for?'

Inge firmly identified himself as a Christian Platonist, belonging thereby to a tradition that extends from the first Christian century through Augustine to our own times. He held that any adequate view of the world must take modern science into account, and he spoke and wrote on social and moral issues. He consciously endeavoured to combine Platonic philosophy with Christian theology. Plato argued for the existence of Forms - abstract objects that are the truth conditions of necessary truths and the referent and ground of correct standards for moral and aesthetic values. There is, for Plato, also a deity who designs the world from matter whose recalcitrance limits his ability to form it exactly after the pattern provided by the Forms.

Inge held that religion involves belief in an eternal, spiritual, ideal world of which the natural, temporal world is an imperfect copy. Agreeing with Plato that there are eternal, unchangeable standards for truth, goodness and beauty, but holding to Christian monotheism, he held that Truth, Goodness and Beauty are not Forms, but attributes of a personal God who in no way depends for existence or perfection on the existence of a temporal world. The attributes themselves provide the only ontological basis for absolute values, and our awareness of these attributes provides us with the only knowledge of absolute values, which are discovered not made, ends and not means. Our wellbeing resides in awareness of, and conformity to, these ideals. Inge contrasted, then, the temporal world, in which evil is an inseparable condition of good, with the eternal world, which contains no evil. The hope that religion provides envisages our leaving the temporal world for the eternal.

Inge rejected natural theology, holding that there can be no successful inference from things that do exist but might not have existed to a being that exists with necessary independence. He also held that the doctrines of the virgin birth and bodily resurrection of Jesus Christ relate to scientific matters that are not of religious concern. The former entails that Mary bore a child without ceasing to be a virgin, and the latter entails that the dead body of Jesus was placed in a tomb and later restored to life, albeit as a body with powers not possessed by human bodies generally. Inge's Platonist, nonhistorical perspective led him to think of such things as biological and historical, not religious or theological. If Inge sometimes reshaped Platonism to fit his Christianity, here he arguably trimmed his Christianity to fit his Platonism.

In the *Outspoken Essays* (1922), Inge incautiously remarks that should the necessity arise, he could do without the Old Testament prophets and without Christ, and make do with just Plotinus. But in his Gifford Lectures, *The Philosophy of Plotinus*, he writes that:

> So far as I can see, nothing but a personal Incarnation, and the self-sacrifice of the Incarnate, could either adequately reveal the love of God for man, or call forth the love of man for God…. Vicarious suffering - the suffering of the sinless for the sinful - remained a stumbling block for the non-Christian world; and it is only in

this doctrine that the sting of the world's sorrow and injustice is really drawn.

(1918, vol. 2: 227)

The contrasting emphases of these remarks perhaps illustrate the conflicting perspective of a philosophy which can find no ultimate significance in anything not eternally true and a religion whose central doctrines make ineliminable reference to particular events and a particular historical person. At any rate, they illustrate the difficulty one who wishes to combine the two can have in doing so consistently.

Innate knowledge

If innate knowledge exists, there must be innate beliefs and those beliefs must count as knowledge. In consequence, the problem of clarifying the concept of innate knowledge divides in two: to explain what it is for a belief to be innate and then to connect that account with a characterization of what knowledge is. Modern biology requires changes in traditional philosophical conceptions of innateness; and two quite different theories of knowledge entail that innate beliefs will often fail to count as knowledge.

1 Innateness

Within some species of bird, individuals produce their characteristic song even if they are reared in silence. Among others, a bird sings its song only if it first hears that song performed. And among still others, a bird produces its characteristic song only if it hears some sort of song or other (Gould and Marler 1991). We are inclined to apply the concept of innateness to the first type of bird and to withhold it from the second. But what of the third? Should we say that these birds learn their songs by hearing any of a set of quite dissimilar songs? Or should we say that the song is innate - that it is ‘in’ the bird, only awaiting an environmental trigger for its release?

Both options seem unsatisfactory. How can a given song be learned from hearing a quite different song, if the target song would have emerged regardless of which song the bird had heard? The option of judging the song innate also has its pitfalls. What does it mean to say that the song is ‘in’ the bird from the start? This spatial metaphor sounds suspiciously like the preformationist doctrines of eighteenth century embryology, according to which foetal development simply involves an increase in size of the fully formed individuals found in newly fertilized eggs. Arguably, the song is ‘in’ the bird from birth no more than adolescent pubic hair is ‘in’ a new-born baby.

It is important not to confuse the claim that the song is ‘in’ the bird from birth with the much less controversial claim that the new-born bird is disposed to acquire the song once the bird passes various developmental landmarks and experiences various environmental cues. The latter claim does not entail the former. Indeed, the latter formulation offers a completely de-natured reading of the idea of innateness; it becomes trivially true that all beliefs are innate. Surely this formulation short-circuits the controversy rather than solving it.

(In *Notes on a Certain Program*, Descartes suggests that ideas are innate in precisely the same sense that diseases are sometimes innate; this does not mean that foetuses suffer from diseases *in utero*, but that individuals are born with a certain ‘disposition’ to contract them. The challenge to innatism, laid down by Locke in the *Essay Concerning Human Understanding*, is to explain what ‘disposition’ means so that some traits, but not others, turn out to be innate. Leibniz takes up this challenge in the *New Essays*.)

Contemporary biology does not exploit the philosopher’s traditional distinction between innate and learned. First of all, the biological opposite of innate is not ‘learned’, but ‘acquired’. Learning is one way to acquire a characteristic, but there are others; sunburns are acquired, but they are not learned. It is worth asking what distinguishes learning (and *mis*learning) from other processes of belief acquisition; if beliefs could be acquired by swallowing pills, arguably that would not count as learning. In any event, the present point is that biologists do not think of ‘innate’ and ‘learned’ as exhaustive alternatives.

Perhaps the most important contrast between the biological and the traditional philosophical concept is that biology does not treat the difference between innate and acquired as a dichotomy; rather, it is a matter of degree. Traits differ with respect to how dependent their emergence is on environmental details. The three groups of birds described before can be arrayed on a continuum; there is no need to draw a line that separates two of them from the third.

It is also important to distinguish the initial appearance of a trait from its subsequent maintenance. A trait may emerge across a wide range of environments and yet be modifiable once in place. For example, an Egyptian vulture, when first confronted with an ostrich egg and a stone, will break the egg with the stone. However, if the vulture repeatedly discovers that the eggs it breaks open are empty, eventually it will stop breaking eggs (Pulliam and Dunford 1980). In this case, the behavioural disposition might be termed innate. All the same, ‘innate’ does

not mean ‘unmodifiable’.

Yet another gap between the traditional philosophical concept and modern biology concerns the issue of universality. Philosophers often expect innate beliefs to be universal in our species; they are part of ‘human nature’ and so should be present in all individuals who have enjoyed a normal development. (Thus we find Locke, in the *Essay* (bk I, ch. III, §§8-18), arguing that the idea of God is not innate because it is not found in children and ‘savages’.) A related expectation is that if two people have a trait, then the trait must be innate for both if it is innate for either.

Neither of these assumptions is unproblematic. The biologist’s concept of a ‘norm of reaction’ describes how the phenotype which a genotype will develop depends on the environment it experiences. For example, consider a particular fruitfly genotype; let us ask how that genotype’s attainment of a particular phenotype (for example, bristle number) depends on some environmental variable (for example, nutrition). Different genotypes often exhibit different degrees of environmental contingency with respect to the same phenotype. One fruitfly genotype may produce the same bristle number regardless of variation in nutrition, whereas another may produce different numbers of bristles in response to different amounts of food. Because of this, it is quite possible for two flies to have the same number of bristles, but to have achieved that result by quite different developmental pathways. Bristle number may be ‘innate’ for one and ‘acquired’ for the other.

In view of all this, it is a reasonable hypothesis that the most that can be salvaged from the ancient concept of innateness is this: *a phenotypic trait is innate for a given genotype if and only if that phenotype will emerge in all of a range of developmental environments*. What counts as the appropriate range of environments is left open in this proposal. Perhaps there is a uniquely correct answer to this question; then again, maybe the range is determined pragmatically. It is difficult to see how the latter conclusion can be evaded.

2 Innateness and the a priori

The above definition opens a large gap between the concepts of innateness and a prioricity. A proposition is a priori if it can be known or justified independently of experience (see A priori). A prioricity does not concern what causes an organism to formulate a belief; rather, it has to do with the status the belief enjoys once it is formulated. Arguably, the belief that all bachelors are unmarried is not innate; it emerges in some social and linguistic environments, but not in others. Still, once an individual has this belief, it may be true that the belief can be justified without appeal to experience.

Conversely, it is also possible for a belief to be both a posteriori and innate (see A posteriori). Perhaps human cognitive development inevitably leads people to believe that a physical world exists external to their own minds. This is as natural and invariant a developmental outcome as the acquisition of pubic hair during adolescence. Yet, it remains for the philosopher to judge whether solipsism is a priori false. Perhaps our natural anti-solipsism is either unjustifiable or is justifiable as an inference to the best explanation; maybe the postulate of an external world makes sense because it explains regularities that obtain in the flow of experience. If so, we would have here the case of an innate belief that is a posteriori (see Inference to the best explanation).

3 Knowledge

If we have beliefs whose emergence is relatively invariant across a range of developmental backgrounds, will those beliefs count as knowledge? To begin with, if *S* knows that *p*, then *p* must be true. Beyond that, what does knowledge require? Let us explore the suggestion that *S*’s belief that *p* counts as knowledge only if *S* is justified in believing *p*.

The justification that *S* has for believing *p* presumably must come from other beliefs (or thoughts or sensations) that *S* has. In particular, it is not enough that those other beliefs (or other items) bear some abstract relation of justification to the proposition *p*; after all, it might be true that *S* believes *q* and that *q* is evidence for *p* even though *S* believes *p* for no reason at all or for bad reasons. What is required is that *S*’s belief in *p* be related ‘in the right way’ to *S*’s justifying belief in *q*.

What might this right way be? One possibility is that *S*’s belief in *q* causes *S* to start believing *p*. Another is that *S* continues to believe in *p* because *S* believes *q*. A third is that *S*’s belief in *q* makes it harder for *S* to stop believing

p. The list could continue (see Justification, epistemic; Knowledge, concept of §§1-6).

Regardless of how this condition is interpreted, it seems clear that innate true beliefs can fail to count as knowledge. Consider a belief that people inevitably have and cannot abandon; perhaps our spontaneous anti-solipsism is an example. Such propositions may admit of inventive justifications, but this does not mean that philosophical pronouncements can influence whether ordinary folks believe in an external world.

Let us turn, instead, to a concept of knowledge that abandons the requirement of justification. Reliability theories of knowledge demand that the act of believing should be related to the world in the right way. If *S* knows that *p*, then it must be true that, in the circumstances that *S* occupied, *S* would not have believed *p* unless *p* had been true. If *S* knows that *p*, then the requirement is that the probability that *p* is true given that *S* believes that *p*, is equal to 1.0. *S* must be a perfectly reliable detector of the truth of *p*, if *S*'s belief that *p* is to count as knowledge (Dretske 1981) (see Reliabilism).

It is easy to see why an innate belief can evolve so as to violate the requirement that the probability that *p* is true given that *S* believes that *p*, is equal to 1.0. For example, suppose that snakes are usually, although not always, dangerous. An organism that confronts a snake thus faces a problem of decision-making under uncertainty. It can believe without further ado that the snake is dangerous; or, it can try to find some further observational evidence on which to base its decision. In the former case, the organism might have the innate belief that snakes are dangerous. In the latter, its opinion will depend on the details of present and past experience.

Imagine that the organism in question is not very good at determining from observable cues whether a snake is dangerous. Imagine further that the organism does better by erring on the side of caution (Stich 1990). If the snake is dangerous, it is very important to believe that this is so; but if the snake is not dangerous, it is of much smaller moment whether one realizes this fact. These assumptions all favour the evolution of the innate belief that snakes are dangerous. Innateness will be a better strategy than learning in this instance (Sober 1994).

Notice that the factors that predict the evolution of innateness provide no guarantee of the reliability of the resulting beliefs. The organism believes of each snake encountered that it is dangerous. The organism therefore has true beliefs only as often as snakes in fact are dangerous. This need not be a terribly high frequency; it clearly need not equal 100 per cent. For this reason, it is easy to see how innate beliefs can fail to count as knowledge from the point of view of the reliability theory of knowledge. Indeed, there is no guarantee that the belief must be true more often than not; pervasive error may be a consequence of the evolution of innate beliefs.

Innocence

In its most general sense, innocence refers to the state of being without sin. A more restricted meaning is attributed to the word in the legal sphere, where people who are found not to be guilty of a particular crime are described as innocent. In official teaching of the Roman Catholic church, all direct killing of the innocent is forbidden. Here the word refers to people who are not harmful. Nowadays, this can be taken to mean 'non-aggressors'. According to Rousseau, humans possess original goodness. Corrupting influences come from outside them.

Innocence, in perhaps the oldest sense of the term, is the state of being sinless or unacquainted with evil (see Evil; Sin). Within various branches of Christianity such is believed to have been the original state of the first humans. However, in view of the fact that nobody on this planet appears to be in such an immaculate condition now, the term 'innocence' usually has a more restricted meaning. It can be used thus in the sphere of ethics, although it would seem to be more commonly employed in legal circles, where people who are found not to be guilty of a particular crime are described as innocent. The fact that they may have committed innumerable other misdemeanours which do not fall within the ambit of the law is of no consequence in this regard. It is often said in such cases that the people concerned are not guilty of wrongdoing because they either did not perform a certain act, or, having indeed performed it, were not blameworthy in so doing. It is worth noting, however, that, in courts of law, the label 'innocent' can be, and often is, applied to people who have acted in accordance with the requirements of a particular law, even in cases in which, from an ethical point of view, breaking the law would have been the right thing to do. Nevertheless, there can also be innocence in the moral sense in such cases if the people concerned sincerely believe that they have acted rightly in obeying the law, unless, of course, their belief is based on culpable ignorance (see Responsibility §2).

Having said that, it is worth noting that the term 'innocence' is, in fact, sometimes used to describe the state of people who are ignorant of certain evils. The adjective 'innocent' occasionally replaces 'naïve' in such cases. In spite of what has already been said about culpable ignorance, such innocence can be an endearing, although also dangerous, quality, as is often the case with small children who are open and trusting, never having been exposed to more than a few minor forms of malevolence. Here we can say that the state of ignorance or innocence results from a lack of experience of the harsh realities of life.

In some spheres of ethics, most notably in Roman Catholic moral theology, the term 'innocence' and its adjective have been attributed a good deal of importance in debate about the rightness or wrongness of killing people. According to official Roman Catholic teaching, no direct killing of the innocent can ever be condoned. Here again a restricted meaning is adopted. In current Catholic literature the word 'innocent' is used to refer to non-aggressors, an obvious example being noncombatants in time of war. One may kill an aggressor in a just war, or, even outside the war situation, in an act of self-defence or when acting in defence of a third party, provided that there is a proportionate reason for doing so. Non-aggressors (innocent people), however, may be killed only indirectly, in accordance with the requirements of the principle of double effect (see Double effect, principle of). This might happen during a just war, as a result of the bombardment of an enemy installation, near or in which are some noncombatants. Their deaths could be accepted as a regrettable but unavoidable side effect of the bombardment, provided that killing them was not the aim of those effecting the bombardment, that the good intended was not brought about by means of those deaths, and there was a proportionate reason for effecting the bombardment in the first place (see War and peace, philosophy of §§2-3).

The same kind of thinking is applied in the sphere of medical ethics (see Medical ethics §§2, 4). Official Catholic teaching prohibits all direct abortion, but permits such therapeutic procedures as hysterectomies performed on pregnant women suffering from cancer of the uterus. The foetuses - described as innocent persons - are aborted indirectly. Something similar can be said about official Catholic teaching regarding euthanasia. Even a person who asks to be killed remains innocent in the sense under discussion, and may not, therefore, be killed directly. Analgesics, however, may be administered to such a person to relieve intolerable pain, even though it is foreseen that they will have the side effect of shortening their life. Again, in this last case, an innocent person is killed, but indirectly.

A lack of innocence in this sense is also attributed to at least some people found guilty of murder. Official Roman Catholic teaching permits capital punishment in such cases, but only if less violent ways of protecting human life and public order from such aggressors are unavailable.

The unrestricted meaning of innocence would seem to be what is referred to in the writings of Jean-Jacques Rousseau. In his opinion (1762), the fact that we see that people are wicked in no way conflicts with the fact that humans are naturally good, possessing original goodness. In their original state, there is not a single vice in their hearts, no perversity at all. Evil must have an external source. In bringing up our children, therefore, we need, according to Rousseau's way of thinking, to keep away from them all corrupting external influences in order that nature may be allowed to take its course. Children must have a natural education, that is, an education that interferes as little as possible with their free, natural development.

Institutionalism in law

'Institutionalism' is the name for an approach to the theory of law worked out in the late nineteenth and early twentieth centuries by a number of scholars from continental Europe, working mainly in independence from each other. Their common characteristics can be stated only in rather generic and negative terms. They are all critical of statalism, that is, too readily identifying law and state; of voluntarism, that is, treating will as an essential element of law; and of normativism, defining law as a body of norms. In positive terms, they have in common a generic emphasis on the social character of law, and a sense of the need to take a view of legal experience broader than that defined by its traditional boundaries, and to extend the 'official' catalogue of the sources of law.

Nowadays, there is new talk of institutionalism in the philosophy of law, but in a different sense, with reference to the idea of law as made up of institutional facts, that is, facts whose meaning depends on norms. This neo-institutionalism is normativist, analytical and hermeneutic in approach and has only the most tenuous links with classical institutionalism.

1 1 Institutions and institutionalism in law

Legal institutionalism conceives of law as a kind of 'institution'. No less evasive a definition could be given without opening the question of the rival merits of the various institutionalist theories and of the notion of 'institution' that each adopts. 'Institution' is an intrinsically ambiguous term, used in a notably wide variety of senses, to the point of appearing useless to many thinkers. As well as being a term in general use, it is also a technical term in social science, particularly in sociology, where it is often simply a synonym for social organization or for some element of social structure; elsewhere, it has come to be used, in an equally general way, to denote any sort of conduct or belief sanctioned and practised in a stable way by a community. In a more restricted sense again, 'institution' is used to signify the normative aspect of social organizations; in this sense, for example, 'marriage' would be the institution corresponding to the family as a social order.

This variety of meanings is reflected, obviously enough, in law. In legal culture, however, yet other senses of the term 'institution' are to be found. This expression is customarily used to signify appointment to an office, or constitution of an heir, or, in its substantive use, an entity or organization personified by the law. In the plural, one speaks of institutions to signify the fundamental elements of a discipline (here remembering the *Institutiones* of the Roman jurist Gaius). Jurists in some linguistic traditions are accustomed to make a (somewhat variable) distinction between 'institution' and 'institute', often using the former to refer to underlying social regularities (for example, capitalist ownership) while the latter denotes a standard set of legal relations conceived in abstract terms (for example, property). This distinction highlights the normativism and formalism implicit in common juristic thought. It is no accident that it is a distinction given prominence by the neo-institutionalism discussed in §5 below.

'Classical' legal institutionalism is however more indebted to the sociological than to the juridical usage of the term 'institution'. Historically, institutionalism was a family of jurisprudential approaches that arose in the late nineteenth and early twentieth century in France and Italy. The historical phenomenon that most influenced its theoretical development was the swift transformation of the nineteenth-century liberal state through the rise of intermediate groups between individuals and the state, such as industrial corporations and trade unions. The concept 'institution', because of its very vagueness and ambiguity, has been found serviceable, in law and elsewhere, as the key to analysis and even justification of the changes in social relationships and power-relations that have taken place (see Social theory and law §2).

Thus it is easy enough to determine the extension of the term 'legal institutionalism' by pointing out the approaches that have been called 'institutionalist'. What is not so easy is to determine its intension, by identifying the characteristics common to the various legal institutionalisms; some even doubt the possibility of doing so. A common characteristic does however exist, namely, a generically realist tendency, a propensity to regard the law as a social phenomenon (see Legal realism §2). The use by institutionalist approaches of the terminological apparatus thrown up by the nascent social sciences should not however deceive us into supposing that the theories in question sought to establish an empiricist view of law; on the contrary, legal institutionalism arose by and large from ethico-political impulses (this is particularly true of Renard and Gurvitch; see §3), and, even when driven by epistemological tenets, as in the case of Santi Romano (see §4), it was inspired more by a formalistic legal-science

model than by sociological empiricism. Beyond the rather weak unifying element of a generic realism, one can go no further. For the institutionalist authors have neither a shared cultural formation nor shared philosophical reference points in the way of common ontological or epistemological ideas; nor have they even shared ethico-political attitudes.

2 2 Maurice Hauriou

Maurice Hauriou, French theorist of public law, has come to be regarded as the founding legal institutionalist. He set himself against two targets: extreme subjectivism fixated on the notions of will and of contract (here the critique is of Rousseau and certain nineteenth-century German theories of public law), and extreme objectivism premised on the notion of the rule of law (here criticized are Duguit and Durkheim). (see Durkheim, É.; Rousseau, J.-J.). For Hauriou, institutions are both social facts and legal configurations; they both pre-exist and produce law. They can be either institution-persons (corporate bodies such as the state, associations, companies) or institution-things (such as the standing rules of the law). His earlier work stresses power as the unifying factor of institutions, and he defines them in terms of power-relations (Hauriou 1910); later, he accords greater importance to what he calls the '*idée directrice*' ('directing idea') or '*idée d'oeuvre*' ('operative idea'). 'Among those interested in the idea there are produced manifestations of communion directed by its organs of authority and regulated by a definite procedure' (Hauriou 1925). The elements of the institution are thus the '*idée directrice*', the power organized through realization of the idea, and the communal activities which are produced in the social group as reflections of the idea and its realization. The profoundly mysterious notion of the 'directing idea' belongs to an organicist social theory, permeated with vitalism (the subtitle of Hauriou's best-known work is much to the point: 'an essay in social vitalism'); a theory in which the idea of institution remains nebulous and with the vaguest of boundaries. Hauriou's philosophical ideas are, to be sure, eclectic and unsystematic (Bergson's influence can be seen), and in any event they have the sound of *ex post* justifications for a theory that remains at base an essentially juristic one.

3 3 The development of French institutionalism: Renard and Gurvitch

Hauriou's work has aroused few echoes in common law countries, or in the German-speaking countries; yet it has been highly influential in the Hispanic and Italian worlds, and of course in France. In France, Georges Renard and Georges Gurvitch were both pupils of Hauriou's who reacted against voluntaristic dogmas and juridical individualism and statalism, and shared an ambition to broaden the horizons of legal experience.

A critic of voluntarism and of individualism, Renard (1876-1943) shared Hauriou's opposition to identification of law with enacted law. The essence of institutions in his view lies in the way in which activities cohere in the pursuit of a common aim, with a preordained internal structure; such a structure is always based on authority-relationships (Renard 1930). He tries to subsume this institutionalist conception of his, standing as it does midway between sociology and jurisprudence, under a Thomistic metaphysics. This leads Renard on the one hand to interpret the social philosophy of Aquinas as an institutionalist theory before its time, while on the other hand treating institutions as all essentially directed towards realization of the common good (see Thomism; Natural law §§3-4).

Gurvitch (1894-1965), a Russian lawyer who became a naturalized French citizen, was a sociologist of law with social-democratic convictions. At the centre of his thought lay his idea of 'normative fact', which he treated as equivalent to Hauriou's 'institution'. Law was not founded on will or on some norm or norms, but on the very fact of union or of associational community, that is, on a 'normative fact'. Gurvitch (1932) also brings to bear on this pluralistic and anti-formalist conception of law a thoroughly value-laden philosophical approach, which he calls 'transpersonalism'. This is based on an exaltation of 'social law' and 'social rights', whose essential characteristic is found in integrative relationships, and which stand in opposition to individual rights, with their contrasting character of being coordinative and subordinative. Social rights, in Gurvitch's definition, are autonomous communitarian rights, which provide an objective integration of every really active collectivity, whether or not organized.

4 4 Italian legal institutionalism: Santi Romano

Santi Romano (1875-1947) was an Italian public lawyer and author of an institutionalist theory which enjoyed

great currency in his own country, and was applied in several branches of law, including international law, ecclesiastical law and labour law. His thought was little if at all influenced by Hauriou's work, of which he had some knowledge and appreciation, but which he thought rather limited in scope and insufficiently jurisprudential. He was a pure jurist and the creator of a general theory that was rigorously anti-philosophical and pure of any sociological influence. Moreover, as against the French institutionalists, he was a critic of natural law and a defender of the thesis of the separation between law and morals; in this sense he can be considered a legal positivist (see Legal positivism §1).

Romano's polemical writings have as their targets normativism and the common definitions of law that are based on examples drawn from private law and hence inadequate for the explanation of the other branches of law (Romano 1917-18). This gives rise to his definition of law as a juridical order, a notion which in turn leads back to that of institution. Romano takes 'institution' to signify any social entity or body. This entails an extreme form of legal pluralism, and leads Romano to the point of treating as legal even organizations that are prohibited by state-law, and indeed to considering revolutionary organizations as juridical orders. Romano, for whom every social organization, however ephemeral and transitory, counted as a juridical order, tended to represent all social relations in a legal guise. Such an approach in the final analysis has the effect of blanking out social conflicts, since these come to be depicted as instances of relationships between orders, and the orders in their turn are seen as having a spontaneous tendency toward orderliness.

Romano's institutionalism won the approbation of the German legal thinker Carl Schmitt, theorist of National Socialism, who saw in it an exemplification of his own conception of law as a concrete order. This conception, along with normativism and decisionism, in Schmitt's view constituted the three basic types of pure legal thought (Schmitt 1934). Extremist in thought as he was, Schmitt saw with perfect clarity that institutionalism, if carried to its logical conclusions, could not but end up in a radical realism in which the reality of the law becomes reduced to mere relations of power and of decision-making.

5 5 Contemporary legal institutionalism: MacCormick and Weinberger

The classical institutionalist theories were all ethico-political and were characterized in general by a holistic and organicist view of society and an aversion from conflict-models of society and law. Each emphasized the values of order, of neutralization of conflicts, of harmony and social integration.

Taken as legal theories in the strict sense, the varieties of institutionalism have the considerable merit of having neutralized the extremer versions of opposed opinions, and in particular normativism, though they did not refute it outright. In truth, the anti-normativist polemics convince only in relation to a narrow Austinian notion of the legal norm, understood as the imperatival expression of an act of human will (see Austin, J.). This notion is now completely discredited. Institutionalism in its moderate, non-Schmittian version cannot coherently be completely anti-normativist. For the very ideas of social organization on which it is founded presuppose norms that regulate and empower individuals (see Norms, legal). The anti-normativist polemics of the institutionalists have without doubt contributed to bringing legal theory up to date. In particular, the emphasis on the notion of organization has brought about general acceptance of a conception of the law as a normative order, and has led to the elaboration of a typology of norms better suited to representing law in terms of structured ordering, giving due recognition to organizational norms, or secondary norms.

Today, classical institutionalism has lost its innovative drive but jurists do still use many ideas drawn from institutionalist theories to give theoretical respectability to their own doctrinal writings. Suffice it here to mention the case of the *lex mercatoria*, or 'New Law Merchant', the so called 'common law of commerce', which has come to be construed as a form of legal order coexisting with the laws of the states and with international law (Osman 1992).

But at present there is also new talk of institutionalism on the part of two contemporary philosophers of law, Neil MacCormick in Scotland and Ota Weinberger the Czech scholar (see Weinberger, O.). MacCormick and Weinberger's neo-institutionalism however has declaredly little in common with classical institutionalism, on several counts. In truth theirs is a conception of law worked out not from the standpoint of the pure jurist nor from that of the sociologist of law, but from that of legal philosophy, indeed that of philosophers with an analytico-linguistic sensitivity and training. Its basis is a confessedly empiricist metaphysics. It is neither

anti-statalist nor anti-formalist in its treatment of the sources of law; moreover, far from criticizing normativism, it treats norms as being at the core of the concept of an institution; and finally, it is a positivistic theory of law, critical of natural law theory (in this having affinity with the ideas only of Romano among the classical school).

The institutionalism of MacCormick and Weinberger starts out from the notion of 'institutional fact' and the related opposition between 'brute facts' and 'institutional facts' (Anscombe 1958; Searle 1969). The law is composed of institutions (contract, wills, statutes and so on) created through the implementation of legal rules. Such institutions are nothing other than abstract concepts through which it is possible to ascribe meaning to, and to interpret, congeries of human actions. Institutions in this sense belong, however, to a philosophical and semiotic notion, and have little in common with the various sociological notions of institution. The ideas of MacCormick and Weinberger (1986) do however disclose an institutional aspect in the classical sense to the extent that they give emphasis to the relationship that always exists between institutions in the philosophical sense and institutions as sociological realities. According to these authors the law is in fact always at the same time (1) an ensemble of abstract meaning-concepts; (2) an ensemble of institutional acts and facts understandable only in the light of the network of rules constitutive of the concepts; and (3) an ensemble of organizations in the sociological sense. However, to grasp the reality of the legal it is indispensable to adopt a hermeneutic outlook whereby it is possible to coordinate the contributions of lawyers, sociologists and philosophers of law (see Legal hermeneutics).

Weinberger's work in particular brings together the notions of institutions and institutional facts and squares them with a more all-embracing philosophico-jurisprudential view, comprehending anthropology, ontology and a formal theory of action.

Intensional entities

Intensional entities are such things as concepts, propositions and properties. What makes them 'intensional' is that they violate the principle of extensionality; the principle that equivalence implies identity. For example, the concept of being a (well-formed) creature with a kidney and the concept of being a (well-formed) creature with a heart are equivalent in so far as they apply to the same things, but they are different concepts. Likewise, although the proposition that creatures with kidneys have kidneys and the proposition that creatures with hearts have kidneys are equivalent (both are true), they are not identical. Intensional entities are contrasted with extensional entities such as sets, which do satisfy the principle of extensionality. For example, the set of creatures with kidneys and the set of creatures with hearts are equivalent in so far as they have the same members and, accordingly, are identical. By this standard criterion, each of the following philosophically important types of entity is intensional: qualities, attributes, properties, relations, conditions, states, concepts, ideas, notions, propositions and thoughts.

All (or most) of these intensional entities have been classified at one time or another as kinds of universals. Accordingly, standard traditional views about the ontological status of universals carry over to intensional entities. Nominalists hold that they do not really exist. Conceptualists accept their existence but deem it to be mind-dependent. Realists hold that they are mind-independent. Ante rem *realists hold that they exist independently of being true of anything;* in re *realists require that they be true of something.*

1 History

Contemporary use of the term 'intension' derives from the traditional logical doctrine that an idea has both an extension and an intension (or comprehension). This doctrine is explicit in most modern logicians of the nineteenth century, implicit in many medieval logicians and, arguably, present in Porphyry and Aristotle. Although there is divergence in formulation, most of these thinkers accept that the extension of an idea (or concept) consists of the subjects to which the idea applies, and the intension consists of the attributes implied by the idea. The Port Royalists (see Arnauld 1662) tell us, 'the comprehension of the idea of triangle includes extension, figure, three lines, three angles, and the equality of these three angles to two right angles, and so forth'. This yields the 'law of inverse ratio': the larger the intension, the smaller the extension. (Note that these traditional doctrines were expressed with the use of plurals and without explicit commitment to classes or sets.) If the extension consists of the individuals (as opposed to species) to which an idea applies, it is evident that two ideas could have the same extension but different intensions. This is the tie to Russell's subsequent notion of an intensional propositional function (1910-13) and leads to our contemporary usage of 'intensional entity' and 'extensional entity'.

In contemporary philosophy, it is linguistic expressions, rather than concepts, that are said to have intensions and extensions. The intension is the concept expressed by the expression, and the extension is the set of items to which the expression applies. On the standard picture, that set is the same as the set of items to which the concept applies, hence the standard view that intension determines extension. This usage resembles Mill's use of 'denotation' and 'connotation' and Frege's use of '*Bedeutung*' and '*Sinn*' (see Mill, J.S. §§2-3; Frege, G. §3).

The systematic study of intensional entities has been pursued largely in the context of intensional logic; that part of logic in which the principle of substitutivity of equivalent expressions fails. For example, 'Necessarily, creatures with kidneys have kidneys' is true whereas 'Necessarily, creatures with hearts have kidneys' is false. Following Frege (1892), Whitehead and Russell (1910-13), Carnap (1947) and Church (1951), the now standard explanation of this failure of substitutivity is this: the truth-value of these sentences is determined, not (just) by the extension of 'creature with kidney' and 'creature with heart' (that is, the set of creatures with kidneys) but (also) by the intensions of these expressions, that is, by the intensional entities which they express (the concept of being a creature with a kidney and the concept of being a creature with a heart). Because these intensions are different, the sentences can have different truth-values.

This account yields a method for determining precise intensional identity conditions: intensional entities should be as finely discriminated as is necessary for explaining associated substitutivity failures in intensional logic. For example, this method has led most philosophers to hold that logically equivalent concepts can be distinct, and even that in a correct definition the definiens and the definiendum can express different concepts. This is not to say that the properties corresponding to those concepts would be distinct; on the contrary, the definition would be correct

only if the properties were identical. Such considerations lead to the view that there are also more coarsely grained intensional entities (properties, relations, conditions in the world). Independent arguments in metaphysics, epistemology, philosophy of science and aesthetics seem to support the same conclusion (see, for example, Armstrong 1978, Bealer 1982, Lewis 1986). On this view, properties and relations (as opposed to concepts) play a primary role in the non-arbitrary categorization and identification of objects, in the constitution of experience, in description and explanation of change, in the theory of inductive inference, in the analysis of objective similarities and in the statement of supervenience principles. In the resulting picture there are both fine-grained intensions, which play the role of cognitive and linguistic contents, and coarse-grained intensions, which play a constitutive role in the structure of the world.

Systematic theories of intensional entities have often incorporated some form of extensional reductionism. The leading reductions (possible worlds, propositional complexes, propositional functions) are critically reviewed below; non-reductionist approaches to intensional entities are then discussed. At issue is the question of what intensional entities *are*. Are they identical to extensional functions, ordered sets, sequences and so on? Or are they *sui generis* entities, belonging to an altogether new category?

2 Extensional reductions

On the possible worlds reduction (see Lewis 1986; Stalnaker 1984), a proposition is either a set of possible worlds or a function from possible worlds to truth-values, and properties are functions from possible worlds to sets of possible (usually non-actual) objects (see Semantics, possible worlds §9). Many people find the possible worlds theory intuitively implausible. Are familiar sensible properties (for example, colours, shapes, aromas) really functions? When I am aware that I am in pain, is a set (function) of possible worlds really the object of my awareness? Besides this intuitive objection, there are familiar epistemological and metaphysical objections to a theory that is truly committed to the existence of things that do not exist actually. Finally, the possible worlds reduction implies that necessarily equivalent intensions are identical, but as seen above this is implausible in the case of concepts and propositions. Certain possible worlds theorists (for example, Cresswell 1985) have responded to this problem by holding that concepts and propositions are ordered sets (sequences, abstract trees) whose elements are possible worlds constructs. This revisionary view is a variation of the propositional-complex reduction.

According to this reduction (see Perry and Barwise 1983), concepts and propositions are nothing but ordered sets (sequences, abstract trees, partial functions) whose ultimate elements are properties, relations and perhaps individuals. For example, the proposition that you are running is the ordered set $\langle \mathrm{running,\ you} \rangle$; the proposition that you are running and I am walking is

$\langle \mathrm{conjunction,\ \langle running,\ you\rangle, \langle walking,\ me\rangle} \rangle;$

and so forth. As with the possible worlds theory, this theory clashes with intuition. When I am aware that I am in pain, is an ordered set the object of my awareness? When I see that you are running, do I see an ordered set? Furthermore, there is in principle no way to determine which ordered set I allegedly see. Is it $\langle \mathrm{running,\ you} \rangle$? Or is it $\langle \mathrm{you,\ running} \rangle$? The choice seems utterly arbitrary, but if the reduction were correct, there would have to be a fact of the matter.

A rather different kind of difficulty arises in connection with ‘transmodal quantification’. Consider the following intuitively true sentence:

(1) Every *x* is such that, necessarily, for every *y*, it is either possible or impossible that $x = y$.

In symbols,

(2) $(\forall x)\Box(\forall y)(\mathrm{Possible}\ [x = y] \vee \mathrm{Impossible}\ [x = y]).$

By the propositional-complex theory, this is equivalent to

(3) $(\forall x)\Box(\forall y)(\mathrm{Possible}\ \langle x, \mathrm{identity}, y\rangle \vee \mathrm{Impossible}\ \langle x, \mathrm{identity}, y\rangle).$

The singular term ‘ $\langle x, \mathrm{identity}, y\rangle$’ may be thought of as a definite description, ‘the ordered set whose elements

are *x*, identity and *y*'. Accordingly, there are two ways to understand (3). On the first construal (corresponding to the narrow scope reading of the definite description), (3) implies

$$(\forall x)\Box(\forall y)(\exists v)v = \langle x, \text{identity}, y\rangle.$$

However, by the principle that, necessarily, a set exists only if its elements exist, this implies

$$(\forall x)\Box(\exists v)v = x.$$

That is, everything necessarily exists. A manifest falsehood. On the alternative construal of (3), corresponding to the wide scope reading of the definite description, 'the ordered set $\langle x, \text{identity}, y\rangle$', (3) implies that every *x* is such that, necessarily, for all *y*, there exists an actual set $\langle x, \text{identity}, y\rangle$. That is

$$(\forall x)\Box(\forall y)(\exists_{\text{actual}}\, v)v = \langle x, \text{identity}, y\rangle.$$

But, by the principle that, necessarily, a set is actual only if its elements are actual, this implies

$\Box(\forall y)y$ is actual.

That is, necessarily, everything (including everything that could exist) is already actual. Another manifest falsehood. So either way, (3) implies something false. But (3) is the propositional-complex theorists' way of representing the true sentence (2). So the propositional-complex theory appears unable to handle intuitively true sentences such as (2). (This style of argument can be exploited in a defence of *ante rem* realism.)

According to the propositional-function theory (see Whitehead and Russell 1910-13), a property is a function from objects to propositions, where propositions are taken to be primitive entities. For example, the property 'being red' is the function (λx)(the proposition that *x* is red). For any given object *x*, the proposition that *x* is red is the result of applying this function to the argument *x*. That is, the proposition that *x* is red is (λx)(the proposition that *x* is red)(*x*). But are the familiar sensible properties really functions? Once again, this is highly implausible and should be rejected on this ground alone if an acceptable alternative exists.

Besides this sort of intuitive difficulty, there are several technical difficulties. Consider an illustration involving properties of integers. Being even = being an *x* such that *x* is divisible by two; and being self-divisible = being an *x* such that *x* is divisible by *x*. Given the propositional-function theory, the following identities hold:

$$\begin{aligned}\text{that two is even} &= (\lambda x)(\text{that } x \text{ is even})(\text{two})\\ &= (\lambda x)(\text{that } x \text{ is divisible by two})(\text{two})\\ &= \text{that two is divisible by two}\\ &= (\lambda x)(\text{that } x \text{ is divisible by } x)(\text{two})\\ &= (\lambda x)(\text{that } x \text{ is self-divisible})(\text{two})\\ &= \text{that two is self-divisible.}\end{aligned}$$

However, that two is even and that two is self-divisible are plainly different propositions: certainly someone could be consciously and explicitly thinking the former while not consciously and explicitly thinking the latter. Indeed, someone who is thinking that two is even might never have considered the concept of self-divisibility. (Analogous difficulties arise for Church's somewhat similar propositional-function theory of concepts (1951). Incidentally, since properties are not propositional functions, using function abstracts to denote them invites confusion. A growing practice is to use $\ulcorner[v\colon\ A]\urcorner$ to denote the property of being a *v* such that *A*, just as in set theory $\ulcorner\{v\colon\ A\}\urcorner$ denotes the set of things *v* such that *A*.)

3 Non-reductionist approaches

Each of the preceding problems arises from the attempt to reduce intensional entities of one kind or another to extensional entities; either extensional functions or sets. These difficulties have led some theorists to adopt non-reductionist approaches (see Bealer 1979, 1982). Consider the following truisms. The proposition that $A\&B$ is the conjunction of the proposition that *A* and the proposition that *B*. The proposition that not *A* is the negation of the proposition that *A*. The proposition that *Fx* is the predication of the property *F* of *x*. The proposition that there

exists an *F* is the existential generalization of the property *F*, and so on. These truisms tell us what these propositions essentially are: they are by nature conjunctions, negations, singular predications, existential generalizations and so on. These are rudimentary facts which require no further explanation and for which no further explanation is possible. Until the advent of extensionalism, this was the standard view.

By adapting techniques developed in the algebraic tradition in extensional logic, one is able to develop this non-reductionistic approach. Examples such as those just given isolate fundamental logical operations: conjunction, negation, singular predication, existential generalization and so on. Intensional entities are then taken as *sui generis* entities; the aim is to analyse their behaviour with respect to the fundamental logical operations.

An intensional algebra is a structure consisting of a domain *D*, a set of logical operations and a set of possible extensionalization functions. The domain divides into subdomains: particulars, propositions, properties, binary relations, ternary relations and so on. The set of logical operations includes those listed above plus certain auxiliary operations. The possible extensionalization functions assign a possible extension to relevant items in the domain: each proposition is assigned a truth-value; each property is assigned a set of items in *D*; each binary relation is assigned a set of ordered pairs of items in *D*, and so on. One extensionalization function is singled out as the actual extensionalization function: the propositions which are true relative to it are the propositions which are actually true, and so on. (More formally, an intensional algebra is a structure $\langle D, \tau, K, G \rangle$. *D* divides into subdomains: $D_{-1}, D_0, D_1, D_2, \ldots$. D_{-1} consists of particulars; D_0, propositions; D_1, properties; D_2, binary relations, and so on. τ is a set of logical operations on *D*. *K* is a set of extensionalization functions. *G* is a distinguished function in *K* which is the actual extensionalization function.)

To illustrate how this approach works, consider the operation of conjunction, conj. Let *H* be an extensionalization function. Then, conj satisfies the following: for all propositions *p* and *q* in *D*, *H*(conj(*p*, *q*)) = true iff *H*(*p*) = true and *H*(*q*) = true. Similarly, if neg is the operation of negation, then for all propositions *p* in *D*, *H*(neg(*p*)) = true iff *H*(*p*) = false. Likewise, for singular predication preds, which takes properties *F* in *D* and items *y* in *D* to propositions in *D*: *H*(pred_s(*F*, *y*)) = true iff *y* is in the extension *H*(*F*).

This non-reductionistic approach can be extended to more complex settings in which, for example, both fine-grained intensional entities (concepts, propositions) and coarse-grained intensional entities (properties, relations, conditions) are treated concurrently and in which a relation of correspondence between the two types of intensional entities can be characterized in terms of the fundamental logical operations. The non-reductionist approach can thus accommodate the fine-grained intensional entities which serve as cognitive and linguistic contents and also the more coarsely grained intensional entities which play a constitutive role in the structure of the world.

Intensional logics

Intensional logics are systems that distinguish an expression's intension (roughly, its sense or meaning) from its extension (reference, denotation). The purpose of bringing intensions into logic is to explain the logical behaviour of so-called intensional expressions. Intensional expressions create contexts which violate a cluster of standard principles of logic, the most notable of which is the law of substitution of identities - the law that from a $=$ *b and P(a) it follows that P(b). For example, 'obviously' is intensional because the following instance of the law of substitution is invalid (at least on one reading): Scott* $=$ *the author of* Waverley*; obviously Scott* $=$ *Scott; so, obviously Scott* $=$ *the author of* Waverley*. By providing an analysis of meaning, intensional logics attempt to explain the logical behaviour of expressions such as 'obviously'. On the assumption that it is intensions and not extensions which matter in intensional contexts, the failure of substitution and related anomalies can be understood.*

Alonzo Church pioneered intensional logic, basing it on his theory of types. However, the widespread application of intensional logic to linguistics and philosophy began with the work of Richard Montague, who crafted a number of systems designed to capture the expressive power of natural languages. One important feature of Montague's work was the application of possible worlds semantics to the analysis of intensional logic. The most difficult problems concerning intensional logic concern the treatment of propositional attitude verbs, such as 'believes', 'desires' and 'knows'. Such expressions pose difficulties for the possible worlds treatment, and have thus spawned alternative approaches.

1 Intension and extension

Gottlob Frege believed that expressions of language have both an extension (reference, denotation) and an intension (sense, meaning; see Sense and reference). He distinguished intensions from extensions to explain a failure of the law of substitution of identity. From 'The author of *Waverley* $=$ Scott' and 'John admires the author of *Waverley*' it does not follow that 'John admires Scott', for John may think that Scott wrote *Ulysses*, which he hates. (Frege illustrated the point with 'the morning star' and 'the evening star'.) One way out of the puzzle is to assume that the second sentence reports a relation (of admiration) between John and the meaning (or intension) of '*Waverley*', rather than a relation between John and the extension of 'the author of *Waverley*', that is, Scott. The fact that the meanings of 'Scott' and 'the author of *Waverley*' differ can help explain why substitution fails.

The failure of substitution in the preceding example is caused by the word 'admires'. Such intensional expressions violate several other standard principles of logic. A notable case is existential generalization: $P(a)$; therefore there exists an *x* such that $P(x)$. Existential generalization fails because, for example, 'John admires Superman' does not entail that Superman actually exists. The stock of intensional expressions of English is very large. It includes phrases such as 'it is necessary that', 'it used to be the case that', 'believes that', 'it ought to be the case that', and many more.

Under a broad construal, intensional logic includes any logic that accounts for the deductive behaviour of one or more of the intensional expressions. So modal logic, tense logic and logics of belief and obligation all count as intensional logics from this point of view. However, the term 'intensional logic' more commonly refers to those systems in which some explicit symbolic device is introduced for distinguishing intensions from extensions. These are the systems described here.

2 Possible worlds semantics

Despite its failings, possible worlds semantics has come to play a central role in intensional logic (see Possible worlds). The basic idea goes back to Rudolf Carnap. Why do the meanings (or intensions) of 'Scott' and 'the author of *Waverley*' differ? Because there are possible worlds where the author of *Waverley* was not Scott. We can imagine a world, for example, where it was James Joyce or Charles Dickens who wrote *Waverley*. If we consider the extensions that 'the author of *Waverley*' takes across different possible worlds, we will see variations from one world to the next. It makes sense, then, to identify the *intension* of the expression with the pattern of its *extensions* across different possible worlds. Seen in this way, its intension is a function that takes each possible world into a corresponding extension. The value of the function is Scott in the real world, Joyce in another world, and Dickens

in another. The intension for ‘Scott’, on the other hand, is the constant function that has the value Scott in each possible world.

Intensions for sentences, predicates and expressions in other grammatical categories can be treated in a similar way. The extension of a sentence is its truth-value. The intension is identified with the pattern of truth-values the sentence takes across the different possible worlds. It is therefore a function that assigns to each possible world a corresponding truth-value. The same tactic can be used for predicates. The extension of the predicate ‘is blue’ is traditionally taken to be the set of objects that are blue. Its intension is a function that takes each of the possible worlds into a corresponding set of objects (the set of blue objects in that world).

3 Montague’s intensional logic

Alonzo Church (1951) was the pioneer in intensional logic, basing it on his theory of types, but Richard Montague’s work has been crucial to its widespread application in philosophy and linguistics (see Montague 1974). The system IL described here is a variant of Montague’s approach, due to Gallin (1975). Intensions and extensions for sentences, names, predicates, adjectives, prepositions and so on are different sorts of things. Therefore we need to distinguish a rich variety of ‘types’ (grammatical categories or parts of speech). Most intensional logics are constructed from some form of type theory, a higher-order logic that allows a completely general formation of types (see Theory of types; Second- and higher-order logics).

In IL there are two basic types: *t* for truth-values and *e* for entities (or objects). Extensions of sentences belong to type *t* and extensions of proper names belong to type *e*. An unlimited variety of complex types can be defined from the two basic types as follows. If α and β are types then (α, β) is another type, and if α is a type then so is (s, α), where the letter ‘*s*’ is used to indicate the set of possible worlds (or situations). The type (α, β) is for the set of all possible functions which assign to each thing with type α a value with type β. For example, if α is the type for the extension of some expression, then (s, α) is the type for its intension.

Extensions and intensions for the different grammatical categories of English can be assigned one of these types in the following way. Extensions of sentences and proper names are of types *t* and *e*, respectively, and the types for their intensions are (s, t) and (s, e), respectively. The type for predicate extensions is (e, t): the type for functions that take entities into truth-values. The idea is that the extension for ‘is blue’ is a function that assigns the truth-value T (for true) to those entities that are blue and F (for false) to those that are not. This has the same effect as treating the extension of ‘is blue’ as a set of entities, but it simplifies the definition of the complex types. Extensions for transitive verbs should take a pair of entities (one for the subject and one for the object of the verb) into a truth-value, so transitive verb extensions are assigned to type $(e, (e, t))$. The types for intensions of intransitive and transitive verbs would be $(s, (e, t))$ and $(s, (e, (e, t)))$, respectively.

IL has both constants and variables in all the possible types. It also contains the logical symbols ‘ $\equiv$’, ‘ λ’, ‘ $^\wedge$ ’, ‘ $^\vee$ ’, ‘[’ and ‘]’. These symbols allow the construction of complex terms (or expressions). The symbols ‘ $^\wedge$ ’ and ‘ $^\vee$ ’ (called ‘cap’ and ‘cup’) indicate the intension and extension of a term, respectively. So when *A* has type α, $^\wedge A$ is the intension of *A* and must have type (s, α). When *A* has type (s, α), then $^\vee A$ is *A*’s extension and belongs to type α. The symbol ‘ $\equiv$’ indicates identity. When *A* and *B* are two terms of the same type, the expression ‘ $A \equiv B$’ belongs to the *t* (truth-value) type, with the understanding that $A \equiv B$ is true if and only if *A* and *B* name the same thing. $[A \;\; B]$ indicates the result of applying the function that *A* names to whatever *B* names. So when *A* belongs to type (α, β) and *B* to type α, $[A \;\; B]$ belongs to type β. For example, if *A* is ‘runs’ with type (e, t) and *B* is ‘John’ with type *e*, then $[\mathrm{runs} \;\; \mathrm{John}]$ has type *t*, and symbolizes the extension of the English sentence ‘John runs’. When *x* is a variable with type α, and *A* is an expression with type β, then $\lambda x A$ is an expression with type (α, β), indicating functional abstraction. For example, when $A =$ ‘Mary loves *x*’, $\lambda x A$ names the function that assigns to each entity *o* either T or F depending on whether Mary loves *o* or not. Hence, in this example, $\lambda x A$ corresponds to the predicate ‘is loved by Mary’.

IL has strong expressive powers. All of the symbols of predicate logic can be defined in it - including propositional connectives (negation, conjunction and so on) and quantifiers in all the types. Furthermore, the presence of ‘ $^\wedge$ ’ ensures that an S5 strength modal operator ‘ $\Box$’ (read ‘it is necessary that’) can be defined (for a description of S5, see Modal logic). IL is on a firm technical footing. Gallin has devised rules and axioms for IL and has shown how to provide a (generalized) semantics for this system for which IL is both consistent and complete.

Intensional logics such as IL have been applied to tenses, necessity, obligation and many other intensional constructions. The same ideas can be used to analyse indexicals such as ‘I’, ‘it’ and ‘that’, with the understanding that possible worlds include contexts of utterance that help fix the extensions of these terms. A hint at how IL is applied to language can be given by showing how to explain the failure of substitution in the case of John’s admiring the author of *Waverley*. Assume that each of the words of English is assigned an appropriate type of IL. The verb ‘admires’ is intensional, meaning that the object of the verb is an *intension* of type (s, e). So the extension of ‘admires’ falls in type $(e, (\underline{(s, e)}, t))$, not $(e, (e, t))$. It follows that ‘John admires Scott’ is represented in IL by $[[\mathrm{admires} \quad \mathrm{John}] \quad {}^\wedge S]$, where *S* abbreviates ‘Scott’. The cap ‘ $^\wedge$ ’ makes it clear that it is the intension of ‘Scott’ that is at issue. Similarly, $[[\mathrm{admires} \quad \mathrm{John}] \quad {}^\wedge W]$ represents ‘John admires the author of *Waverley*’. The claim that Scott is the author of *Waverley* is written ‘ $S \equiv W$’. Since $S \equiv W$ only says that *S* and *W* have the same *extension*, the inference from $S \equiv W$ and $[[\mathrm{admires} \quad \mathrm{John}] \quad {}^\wedge W]$ to $[[\mathrm{admires} \quad \mathrm{John}] \quad {}^\wedge S]$ is invalid. An identity involving *S* and *W* does not warrant substitution of ${}^\wedge S$ for ${}^\wedge W$.

4 The problem of propositional attitudes

While intensional logics in the style of IL appear to work nicely in the case of tense, necessity, obligation, indexicals and the like, serious problems arise in certain cases when IL is applied to so-called propositional attitude verbs, such as ‘believes’, ‘wants’, ‘knows’ and ‘admires’ (see Propositional attitude statements). The fundamental difficulty is that systems based on IL validate substitution of *necessary* identities: if expressions *A* and *B* have the same extensions in every possible world, then an occurrence of *A* in one expression may be replaced with an occurrence of *B* in another. But such substitution is not valid for propositional attitude verbs. For example, John can know that 17×3 is composite (not prime) but fail to know that 51 is composite, even though in every possible world $17 \times 3 = 51$.

The difficulty is more than a quirk about mathematical expressions. It is widely held that proper names and natural kind terms are rigid designators, that is, that they have the same extension (or none) in every possible world. So substitution of pairs of names (‘Cicero’, ‘Tully’) or natural kind terms (‘water’, ‘ $\mathrm{H_2O}$’) that have the same extensions should be correct in all contexts. However, John can admire Cicero without admiring Tully (even though Cicero *was* Tully), and he can know that water is safe to drink, without knowing that $\mathrm{H_2O}$ is safe to drink (even though water *is* $\mathrm{H_2O}$). The distinctions between intensions defined by possible worlds semantics appear to be too crude to explain the failure of substitution in propositional attitude contexts.

5 Alternative approaches

Alternatives to the possible worlds approach in intensional logic have grown out of the desire to resolve problems including that of propositional attitudes. One natural reaction is to dispense with talk of intensions altogether, and to explain John’s different reactions to the ideas that 17×3 and 51 are composite as due to his different relationships with the symbols ‘ 17×3’ and ‘51’. However, ‘John knows 17×3 is composite’ cannot report a relation between John and the symbol ‘ 17×3’, because this sentence can be true even when John has never seen the symbols ‘ 17×3’.

Max Cresswell’s solution to the problem, following Carnap, is to bring in what he calls structured meanings (1985). The meaning of atomic expressions can be given by a possible worlds account. For example, the meaning of ‘51’ can be the function that picks out 51 in every possible world. For complex expressions, such as ‘ 17×3’, the meaning is a structure, $\langle \mathrm{times}, 17, 3 \rangle$, composed of the meanings of the sub-expressions ‘times’, ‘17’ and ‘3’. Note that $\langle \mathrm{times}, 17, 3 \rangle$ is not itself a symbol, but does preserve the structure of ‘ 17×3’, thereby allowing the meanings of ‘ 17×3’ and ‘51’ to differ.

Since neither ‘Cicero’ nor ‘Tully’ is complex, Cresswell must use different tactics to manage this case. One strategy he discusses is to analyse ‘John admires Cicero’ as ‘John admires the person he calls Cicero’. (However, since Cresswell believes propositional attitude statements are essentially ambiguous, this is not his final word on the topic.)

Other approaches abandon entirely the possible worlds account of intensions. Anderson, for example, presents an intensional logic whose semantics is based on the notion of synonymy (1984). The idea is that the rules of a language allow us to define the class of synonyms for an atomic expression (that is, the set of expressions with the

same intension), called its ‘concept’. Concepts for complex expressions can be built up from the concepts for simple expressions. Expressions of the language are indexed so that A_1 indicates the concept for expression *A*. The problem of the failure of substitution of necessary identities in propositional attitude contexts is solved as follows. We assume that the verb ‘admires’ is intensional, so it must take expressions for concepts, not expressions for extensions. So ‘Cicero is Tully’ is represented by $c = t$, while ‘John admires Cicero’ is represented by Ajc_1, where the index 1 indicates that it is the *concept* of Cicero (c_1) that is at issue. But now Ajt_1 (for ‘John admires Tully’) does not follow, since $c = t$ does not warrant substitution of t_1 for c_1. On the plausible assumption that ‘Cicero’ and ‘Tully’ are not synonymous (that is, do not have the same intension), the substitution can be blocked as desired. Note, however, that ordinary intuitions rule that ‘water’ is synonymous with ‘ H_2O’, and that ‘ 17×3’ is synonymous with ‘51’. Hence the ordinary notion of synonymy cannot explain the failure of substitution in these cases. For a general solution to the problem, Anderson must employ a notion of synonymy that is at odds with ordinary intuitions.

Zalta (1988) lays synonymy aside, and introduces abstract objects to serve as the meanings of intensional expressions. Abstract objects may be thought of as visual images or other mental encodings used to represent features of the world. An extensional term *c* and its corresponding intensional term c_p belong to the same type, and the subscript *p* indicates which person does the encoding. Using this machinery, ‘John admires Cicero’ is represented by $A(j, c_j)$, where c_j indicates John’s encoding of Cicero. Note that the encodings named by c_j (‘Cicero’) and t_j (‘Tully’) may be distinct. Since the notation for ‘Cicero $=$ Tully’ ($c = t$) lacks the index *j*, this claim does not warrant substitution of t_j for c_j in $A(j, c_j)$.

Intensionality

The truth or falsity of many sentences depends only on which things are being talked about. Within intensional contexts, however, truth values also depend on how *those things are talked about, not just on which things they are. Philosophers and logicians have offered different analyses of intensional contexts and the behaviour of terms occurring within them.*

The extension of a term is the thing or things it picks out: for instance, the extension of 'the Big Dipper' is the stellar constellation itself. The intension of a term can be thought of as the way in which it picks out its extension. 'The Big Dipper' and 'the Plough' have the same extension - a particular constellation - but pick it out in different ways. The two terms have different intensions. There is much debate about how we should actually understand the notion of an intension (see Intensional entities).

For many classes of sentence, the substitution of one term for another with the same extension leaves the truth value unchanged, irrespective of whether the two terms also have the same intension. This is called intersubstitution *salva veritate* (preserving truth). For instance, if it is true that the Big Dipper consists of seven stars, then it is also true that the Plough consists of seven stars. In a number of important cases, however, terms with the same extension but different intensions are not intersubstituable *salva veritate*. Consider, for instance:

1 Tom believes that the Big Dipper consists of seven stars.
2 Tom believes that the Plough consists of seven stars.

It is quite possible that Tom mistakenly believes that 'the Plough' refers to a totally different constellation consisting of only six stars, in which case (1) could be true and (2) false. Co-extensive terms cannot be intersubstituted *salva veritate* within the scope of the verb 'believes'. Such contexts are called intensional.

Other verbs which, like 'believe', refer to propositional attitudes - verbs like 'hope', 'desire', 'fear' - also create intensional contexts (see Propositional attitude statements). Propositional attitudes are *intentional* states (note the 't') which has led some to consider the possible connections between inten*S*ionality and inten*T*ionality (see Intentionality §2). The two must be distinguished carefully, however, not least because intensional contexts are also created by non-psychological terms, most importantly modal terms like 'necessarily' and 'possibly'. The intensionality of modal contexts leads to particular difficulties when they also involve quantification (see Modal logic, philosophical issues in §3); these problems have led to controversies over the interpretation not only of modal terms but also of the quantifiers (see Modal operators; Quantifiers, substitutional and objectual §1).

The failure of intersubstitutability *salva veritate* raises questions about the behaviour of terms in intensional contexts. Frege (1892) argues that, in intensional contexts, the term 'the Big Dipper' in (1) refers not to the Big Dipper as usual but to its own intension (or, in Frege's terminology, its sense; see Indirect discourse §1; Proper names §5; Sense and reference §5). Quine (1956, 1961) describes intensional contexts as *referentially opaque*, arguing that terms occurring within them do not refer at all (see Propositional attitude statements §2; Modal operators §1). Davidson's (1969) *paratactic* analysis of propositional attitude statements and of indirect discourse, another intensional context, tries to preserve our intuition that terms in intensional contexts work in the same way as in any other contexts (see Indirect discourse §2; Propositional attitude statements §3).

Many philosophers think that logic should have nothing to do with intensions. But the intensionality of many natural language contexts is hard to deny, and the development of intensional logics suggests that a more tolerant attitude might well pay off (see Intensional logics).

Intention

Suppose that Kevin intends to brush up on his predicate logic, and acts on this intention, because he wants to conduct a good tutorial and he believes that some preparatory revision will help him to do so. In an example like this, we explain why Kevin intends to revise his logic, and why he (intentionally) does revise it, by appealing to the belief and desire which provide his reasons both for his intention and his corresponding intentional action. But how does Kevin's intention to act, coming between his reasons and his action, help to explain what he does? Central questions in the theory of intention include the following: Are intentions distinct mental attitudes or are they analysable in terms of other mental attitudes - such as beliefs and desires? How is intending to do something related to judging that it is best to do it? What distinctive roles, if any, do intentions play in getting us to act? Are foreseen but undesired consequences of an intentional action intended?

1 Intention and belief

Is intending to act a belief that one (probably) will? The identification of intending to act in a certain way with a belief that one (probably) will so act is misguided since even the weaker thesis that intending to act in a certain way implies the belief that one (probably) will is too strong. Thus Kevin may intend to go to the gym (after revising his logic) while harbouring serious doubts about whether he will, which leave him agnostic about the future - for he may know only too well his tendency to balk at doing painful things when the time for action comes, or even to forget his good intentions in such cases. A principal motive for holding the thesis that intending to act implies believing that one (probably) will has been the concern to distinguish intentions from mere hopes or wishes, but such counterexamples show that the distinction will have to be drawn in some other way. Some philosophers hold that there is a minimal positive belief constraint on intention: intention implies the belief that one has some chance of achieving what one intends (see Davidson 1985). Others think that at most one can insist on a negative constraint: intention implies that one does not believe that one (probably) will not do as one intends. Still other philosophers prefer to interpret such a negative belief constraint as a rationality condition on intention. It is not possible to adjudicate these issues here.

Even where an intention to act is matched by a belief that one (probably) will so act, the two are clearly not identical. Suppose an agent who intends to *A* actually does believe that they (probably) will *A*. The agent's belief (insofar as it is rational) will depend upon their estimate of their chances of *A*-ing given that they intend to *A*. So, in such examples, the agent's intention, as a cause of the belief about its presence, will belong, as a distinct item, in the causal background of the (tascit or explicit) reasoning which issues in their belief about what they (probably) will do. Some philosophers have thought that when an intention to act in a certain way corresponds to a belief about what one will do, the belief is not properly construed as based on evidence. Indeed, some even hold the belief in such cases to be noninferential. If the above account is correct, such a belief has perfectly familiar sorts of justifying grounds, namely evidential considerations that bear on one's chances of acting in a certain way, including (saliently) one's belief that one intends to act in that way.

2 Intention and desire

Is intending to do something the same as desiring most to do it? Every intention is or incorporates a desire or want in the broadest sense of these terms, since every intention is or incorporates a motivational state. This concession, however, raises a critical issue in the theory of intention. For some philosophers contend that intentions motivate actions because they are or essentially include predominant desires. This cannot be right since there can be intention without predominant desire, and the converse. Plausible examples here typically exploit a functional difference between intention and predominant desire: the former, unlike the latter, characteristically *settles* the question of what to do for an agent. Thus Kevin's intention may track what he thinks it is overall best to do despite his present strongest desire - as when he forms an intention to go to the gym, which he thinks it best to do, despite wanting most to go to the pub. And conversely, Kevin may continue to treat a question of what to do as open, and so not yet have formed an intention about what to do, despite his present strongest desire - as when he continues to wonder about whether to go to the gym, his predominant desire to go to the pub notwithstanding.

Once the conceptual wedge between intention and predominant desire is granted, however, there remains the issue of how to characterize the role of intentions as motivators of intentional actions, given that that role is not

reducible to desire strength. A natural move, at this point, is to develop the notion that intentions settle for agents, or commit them on, questions of what to do. Such accounts suggest an intuitive contrast between intentions as executive desires and other mere desires. Intentions involve first-order dispositions to act (intentionally), whereas mere desires involve second-order dispositions to act (intentionally). That is, mere desires are or include dispositions to acquire such first-order dispositions to act as are involved in intentions.

Theories of intention which emphasize the notion that intentions settle for agents, or commit them on, questions of what to do have a further virtue. They are especially well-suited to do justice to the several important functional roles which mark out intentions as a group. These functions are that intentions initiate, sustain and guide intentional actions, are elements in coordinative plans, and prompt and terminate practical reasoning.

3 Intention and evaluation

Is intending to act an evaluative attitude? Donald Davidson (1978) construes desires and intentions as evaluative attitudes. Desires are conditional evaluations, the contents of which are expressible in judgments of the form: ‘It is desirable for me to *A* insofar as my *A*-ing is *F*.’ Thus the content of Kevin’s desire to go to the gym would be expressible as (say): ‘It is desirable for me to go to the gym insofar as my going to the gym will help me to keep fit.’ Intentions are unconditional or all-out evaluations, the contents of which are expressible in judgments of the form: ‘It is desirable (intention-worthy) for me to *A*.’ Thus the content of Kevin’s intention to go to the gym would be expressible as: ‘It is desirable (intention-worthy) for me to go to the gym.’ One of Davidson’s chief concerns is how to set out schematically the form of practical reasoning, which contains a mix of cognitive and conative propositional attitudes. By distinguishing among the propositional expressions of attitudes, Davidson hopes to mark differences among the attitudes. His economical proposal is to let ordinary indicative sentences express the contents of ’factual’ beliefs and to let indicatives with explicitly evaluative words express the contents of conative attitudes like desires and intentions. Intentions are then distinguished from mere desires by the all-out or unconditional form of the evaluative sentences which express them. On Davidson’s account, the inferential step wherein an agent comes to have an intention (forms an all-out evaluation by detachment from a corresponding conditional one) is treated as analogous to the inferential step wherein a believer comes to have an inductive belief that a proposition is simply true or false (by detachment from a corresponding subjective probability assessment).

Davidson’s evaluative theory of intention has proved contentious. One issue is whether he is right about the logical form of evaluative sentences. For example, Davidson construes the conditional judgment that it is desirable for me to *A* insofar as my *A*-ing is *F* as having the logical form: ‘It is prima facie desirable for me to *A* insofar as my *A*-ing is *F*’, which he symbolizes as: pf (It is desirable for me to *A*, my *A*-ing is *F*) to bring out the point that these judgments are thought of as the result of applying a ‘prima facie’ operator to a pair of sentences related as evaluation and ground. Such judgments supposedly parallel probabilistic ones of the form: ‘it is probable that it will rain insofar as rain is forecast.’

A second issue is whether, even if he is correct about logical form, Davidson is right to assimilate detached, unconditional evaluations to intentions to act. There are, in fact, good general reasons to resist the assimilation of conative attitudes to evaluative ones. Such reasons have to do with the explanatory value in philosophical psychology of being able to admit fractures between evaluation and corresponding desire or intention (see Akrasia). Yet there is a need for caution here with respect to one of Davidson’s chief preoccupations - namely, the issue of how to represent the form of practical reasoning. For, even if desires and intentions are different from evaluative attitudes, it remains a viable option that sentences expressing the latter are appropriate for marking the former in schematic representations of practical reasoning. The symmetrical line of thought here would be that just as sentences about what is true (belief-worthy) are appropriate for marking beliefs in theoretical cases, sentences about what is desirable in some way or intention-worthy are appropriate for marking conative attitudes in practical cases. Of course, a difference would also have to be conceded, once the difference between conative and evaluative attitudes was conceded. Sentences about what is true (or their equivalents) would count as expressing the contents of beliefs; whereas sentences about what is desirable or intention-worthy would count as expressing the contents of justifying evaluative judgments which corresponded to (without being identical with) conative attitudes.

4 Intentions as self-referential

Are intentions self-referential? When an agent intends to act in a certain way, does the content of the intention make essential reference to the intention itself?

On some proposals the self-referentiality thesis can be characterized (roughly) as follows: an intention to *A* is the intention that, because of this very intention, one will *A*. So, if Kevin intends to brush up on his predicate logic, then (more fully) he intends that, as a result of this very intention, he will so act. Such proposals have an obvious curious feature: they tend to conflate standard cases of intending with special cases of self-control where an agent forms an intention with the higher-order intention of thereby bringing it about that they will act in a certain way.

One standard defence of the self-referentiality thesis is that it explains why some intended behaviour falls short of intentional action (see the discussion of deviant causal chains in Action; Reasons And Causes §3). Consider just one kind of example. Suppose that Kevin intends to shoot an intruder. He aims his gun but, at the crucial moment, is startled by a moving shadow, which causes him to contract his finger, so that he shoots the intruder - but not intentionally. Advocates of self-referentiality have made claims like the following: Kevin does not shoot the intruder intentionally in such a case because he does not do what he intends - since his intention to shoot the intruder is the intention that that very intention will lead him to do the shooting at the crucial moment, which does not happen. Such a defence of the self-referentiality thesis is unconvincing since there is a clear, alternative reason why Kevin does not count as an intentional agent in the example, which has nothing to do with the supposed self-referentiality of intentions. Quite simply, the relevant bodily movement - Kevin's contracting his trigger finger (or perhaps better, the contracting of Kevin's trigger finger) - is not even an action; rather, it is an involuntary movement caused by Kevin's being startled. Or, if Kevin does contract his finger as an action, the action is not even caused by his intention to shoot - he contracts his finger as a result of being startled.

John Searle's version (Searle 1983) of the thesis that intentions are self-referential deserves special comment. Searle distinguishes between prior intentions (intentions that precede actions) and intentions in action (intentions that are contemporary with and part constituents of actions). On Searle's view, both prior intentions and intentions in action are self-referential. A prior intention (say) to raise one's arm has the content: that I perform the action of raising my arm by way of carrying out this intention. An intention in action, when one intentionally raises one's arm, has the content: that my arm go up as a result of this intention in action.

Searle's view that intentions are causally self-referential relies on the idea that the specification of the content of an intention should coincide with the specification of its conditions of satisfaction. But why should this be conceded? Searle seems merely to trade on the apparent coincidence of conditions of satisfaction and content in the case of certain other propositional attitudes (like beliefs and desires) and some speech acts (like statements).

Some philosophers have argued that, in the case of intentions, conditions of satisfaction go beyond content in that there is a distinct requirement on specifications of the former that they include a reference to intentions as causes. Alfred Mele (1992) advances a plausible alternative to the self-referentiality theory of content: the content of an agent's intention to *A* is identical with the intention's plan, and the plan simply consists in the agent's representation of their prospective *A*-ing and of the route, if any, that they intend to take. So the content (plan component) of Kevin's intention to revise his predicate logic simply is that he revise his predicate logic and that he do so by (say) working his way through the relevant chapters of his logic textbook.

5 Intention and intentional action

Is it the case that an agent intentionally *A*s only if the agent intends to *A*? Michael Bratman (1987) has dubbed the thesis that all intentional actions are intended 'the Simple View'. The thesis enjoys initial plausibility, though it does not survive scrutiny.

Sudden or impulsive intentional actions are held to provide counterexamples to the Simple View. The problem in such cases, supposedly, is that there is action without enough time for forethought. This difficulty, however, does not seem very serious. For just how long need it take to form (come to have) an intention? More serious is the problem raised by subsidiary actions, where routine action parts of encompassing intentional and intended actions - like the various steps one takes when walking to the theatre - are apparently intentional without being intended. Such examples do seem to defeat the Simple View.

Another objection concerns examples where rational agents apparently perform intentional actions which it would

be irrational for them to intend to do straightout, given what they believe about the circumstances in which they act. I refer the reader to the debate between Bratman and McCann (1991). It is noteworthy that the examples in question raise several vexed issues. One of these issues is whether it can be rational to try to *A* without its being rational to intend to *A*. Another issue is whether one can intend to try to *A* (where the intention represents *A*-ing as a desired goal, aim or purpose) without intending to *A*.

Consider, finally, the objection to the Simple View that there are intentional actions which are the foreseen, *non-intended* behavioural side effects of other intentional actions. Two concerns come into focus in evaluating this range of counterexamples. The first - and more basic - concern is: when, if ever, do expected behavioural side effects of intentional actions properly count as non-intended? For holists about intention urge that all foreseen side effects of an intentional action - or all seriously considered ones - properly count as intended. The second concern, which accepts that there are expected, *non-intended* behavioural side effects of intentional actions, is the following: when, if ever, are such side effects themselves intentional actions? A common view holds that when expected, non-intended side effects enter - or ought to enter - into one's practical reasoning as (significant) reasons against the action one settles on, such side effects count as intentional actions. On this view, for example, someone who foresees that leaving the party early will insult their host and reluctantly goes ahead - in order to get home to a sick friend by an agreed time - counts as intentionally insulting the host, even though they do not in the least intend to do this. If the common view in question is acceptable, the Simple View is false.

6 Intentions and reasons

When philosophers discuss reasons for intending to act, they normally concentrate on object-related considerations, such as ones which support the claim that the intention is an intention to do something which is of value in some way. Such reasons, which coincide with reasons for acting, do not exhaust the kinds of reasons there are for intending to act, however. For there are also attitude-related reasons, such as considerations that support the claim that the intention is one which it is in one's interest to have. This distinction between object- and attitude-related reasons applies across the range of propositional attitudes - as when, say, evidential reasons for believing are contrasted with prudential or hedonic ones. The distinction bears on rationality, since it suggests that, corresponding to the two broad kinds of reasons, the rationality of propositional attitudes like intentions can be assessed along two different dimensions.

Intentionality

Intentionality is the mind's capacity to direct itself on things. Mental states like thoughts, beliefs, desires, hopes (and others) exhibit intentionality in the sense that they are always directed on, or at, something: if you hope, believe or desire, you must hope, believe or desire something. Hope, belief, desire and any other mental state which is directed at something, are known as intentional states. Intentionality in this sense has only a peripheral connection to the ordinary ideas of intention and intending. An intention to do something is an intentional state, since one cannot intend without intending something; but intentions are only one of many kinds of intentional mental states.

The terminology of intentionality derives from the scholastic philosophy of the Middle Ages, and was revived by Brentano in 1874. Brentano characterized intentionality in terms of the mind's direction upon an object, and emphasized that the object need not exist. He also claimed that it is the intentionality of mental phenomena that distinguishes them from physical phenomena. These ideas of Brentano's provide the background to twentieth-century discussions of intentionality, in both the phenomenological and analytic traditions. Among these discussions, we can distinguish two general projects. The first is to characterize the essential features of intentionality. For example, is intentionality a relation? If it is, what does it relate, if the object of an intentional state need not exist in order to be thought about? The second is to explain how intentionality can occur in the natural world. How can merely biological creatures exhibit intentionality? The aim of this second project is to explain intentionality in non-intentional terms.

1 The history of the concept of intentionality

The term 'intentionality' derives from the medieval Latin *intentio*. Literally, this means a tension or stretching, but it is used by scholastic philosophers of the thirteenth and fourteenth centuries as a technical term for a concept. This technical term was a translation of two Arabic terms: *ma' qul*, Al-Farabi's translation of the Greek *noema*; and *ma' na*, Avicenna's term for what is before the mind in thought (see al-Farabi §3; Ibn Sina §3). In this context, the terms *noema*, *ma' qul*,*ma' na* and *intentio* can be considered broadly synonymous: they are all intended as terms for concepts, notions or whatever it is which is before the mind in thought (see Knudsen 1982). Scholars translate *intentio* into English as 'intention' - but it should be borne in mind throughout that this is not meant to have the connotations of the everyday notion of intention.

Medieval logicians followed al-Farabi in distinguishing between first and second intentions. First intentions are concepts which concern things outside the mind, ordinary objects and features of objects. Second intentions are concepts which concern other intentions. So, for example, the concept *horse* is a first intention since it is concerned with horses, but the concept *species* is a second intention, since it is concerned with first intentions like the intention *horse* (because of the nominalism prevalent at the time, the distinction between the concept/intention *horse* and the property of being a horse is not always clearly made). Many of the medieval philosophers, including Roger Bacon, Thomas Aquinas and John Duns Scotus, followed Avicenna in holding that second intentions were the subject matter of logic (see Logic, medieval §4).

Some of these philosophers developed detailed theories about how intentions were connected to the things they concerned - what we would now call theories of intentionality. One of the most influential theories was that of Aquinas, whose starting point was Aristotle's theory of thought and perception. According to Aristotle, in thought and perception the mind takes on the form of the thing perceived, without receiving its matter. When I think about or perceive a horse, my mind receives the form of horse (see Sorabji 1991; see Aristotle §18). Aquinas developed Aristotle's view. When I think about a horse, the form of horse exists in my mind. But the form has a different kind of existence in my mind than it does in a real horse. In a real horse, the form of horse has *esse naturale* or existence in nature; but in my thought of a horse, the form of horse has *esse intentionale* or intentional existence (see Anscombe and Geach 1961; Kenny 1984). The heart of Aquinas' view is that what makes my thought of an X a thought of an X is the very same thing which makes an X an X: the occurrence of the form of X. The difference is the way in which the form occurs (see Aquinas §11).

These scholastic terms largely disappeared from use during the Renaissance and the modern period. Empiricist and rationalist philosophers were of course concerned with the nature of thought and how it relates to its objects, but

their discussions were not cast in the terminology of intentionality. The terminology was revived in 1874 by Franz Brentano, in his *Psychology from an Empirical Standpoint*. In a well-known passage, Brentano claimed that:

> Every mental phenomenon is characterized by what the scholastics of the Middle Ages referred to as the intentional (and also mental) inexistence of the object, and what we, although with not quite unambiguous expressions, would call relation to a content, direction upon an object (which is not here to be understood as a reality) or immanent objectivity.
>
> (Brentano [1874] 1973: 88)

A few clarifications of this passage are needed. First, Brentano is not particularly concerned to distinguish between a mental state's (or as he called it, a mental act's) relation to a content and its relation to an object - although as we shall see in §2, later writers find a related distinction useful. And second, intentional inexistence does not itself mean that the objects of thought need not exist - although as we shall see, this is a relatively uncontroversial feature of intentionality. What inexistence means is rather that one thing - the object of thought - exists in another, as the object of the mental state itself (see Bell 1990, ch. 1).

Brentano's account of intentionality was developed by his student Edmund Husserl, who reintroduced the Greek term *noema* (plural: *noemata*) for that which accounts for the directedness of mental states. *Noemata* are neither part of the thinking subject's mind nor the objects thought about, but abstract structures that facilitate the intentional relation between subject and object. So *noemata* are not the objects on which intentional states are directed, but it is in virtue of being related to a *noema* that any intentional state is directed on an object at all. In this respect the concept of a *noema* resembles Frege's concept of sense: senses are not what our words are about, but it is in virtue of expressing a sense that words are about things at all (see Frege, G. §3). In other respects, however, senses and *noemata* differ - for instance, *noemata*, unlike Frege's senses, can be individuated in terms of perceptual experiences (see Dreyfus 1984). The point of Husserl's phenomenological reduction was to provide an account of the structure of *noemata* (see Phenomenology, epistemic issues in).

A striking claim of Brentano's is that intentionality is what distinguishes mental from physical phenomena:

> This intentional inexistence is exclusively characteristic of mental phenomena. No physical phenomenon manifests anything similar. Consequently, we can define mental phenomena by saying that they are such phenomena as include an object intentionally within themselves.
>
> (Brentano [1874] 1973: 88)

However, it is important to stress that by 'physical phenomena', Brentano does not mean physical objects. Phenomena are what are given to the mind, and Brentano does not believe that physical objects are given to the mind (see Brentano [1874] 1973: 77-78). The distinction he is making is among the data of consciousness, not among entities in the world: among these data, mental phenomena are those which exhibit intentionality, and physical phenomena are those which do not.

However, in analytic philosophy in the second half of the twentieth century, Brentano's distinction came to be interpreted as a distinction between entities in the world. This was chiefly because of this period's prevailing realism. An important figure in this revival of interest in Brentano's notion of intentionality was R.M. Chisholm. In chapter 11 of *Perceiving* (1957), Chisholm argued against the behaviourism that was popular at the time by showing that it is not possible to give a behaviouristic account of, for example, belief, since in order to say how belief leads to behaviour one has to mention other intentional states (such as desires) whose connections with behaviour must themselves be specified in terms of belief and other intentional states (see Behaviourism, analytic). This suggests that we should postulate an irreducible category of intentional mental entities: reductive physicalism must be false. However, the argument can be taken in another way, as W.V. Quine argued: if we assume reductive physicalism, we can take the irreducibility of intentionality to demonstrate the 'baselessness of intentional idioms and the emptiness of a science of intention' (Quine 1960: 221). Work on intentionality in the analytic tradition in the 1980s and 1990s has attempted to resolve this dilemma. For example, Fodor (1987), Dretske (1980) and others have attempted to reconcile physicalism with the existence of intentionality by explaining it in non-intentional terms.

2 The nature of intentionality

Despite the interest in intentionality in twentieth-century philosophy, there is still controversy about how to characterize it. All writers agree that intentionality is the directedness of the mind upon something, or the aboutness of mental states, but the disagreements start when we try to explain these ideas in more detail.

To begin with, calling intentionality ’directedness’ makes it look as if it is a relation between the mind and the thing on which the mind is directed. After all, if A is directed on B, then A and B are related - if an arrow is directed on a target, the arrow and the target are related. But if the arrow is genuinely related to the target, then the arrow and the target must exist. And similarly with other relations: if Antony kisses Cleopatra, Antony and Cleopatra must exist. But this is not so with intentionality, as Brentano observed (Brentano [1874] 1973: appendix). I can desire to possess a phoenix without there being any such thing. So what am I related to when I am in an intentional state?

One reaction is to postulate that intentional relations are relations to intentional objects. A phoenix is not the material object of my desire, but it is the desire’s intentional object. However, it is not obvious that this really solves any problems. For what are intentional objects? Are they real objects? Brentano and Husserl both thought so: intentional objects are just ordinary objects. But if this is so, then what does it mean to say that intentional objects need not exist? Alexius Meinong, on the other hand, thought that intentional objects have a different kind of existence from real material objects. But this seems to misrepresent intentionality: if I want a phoenix, I want a real phoenix, with wings and feathers - not something with a different kind of existence. In any case, the idea that there are different kinds of existence is of dubious coherence. So whatever we say about intentional objects, they do not offer a satisfactory explanation of intentionality (see Scruton |1970-1).

A second important difference between intentionality and other relations is that with other relations, the way you describe the relata does not affect whether the relation holds. But with intentionality this is not so: you can believe that George Orwell wrote *Animal Farm* without believing that Eric Blair wrote *Animal Farm*, simply because you do not know that Orwell is Blair. But since Orwell is Blair, then your belief surely relates you to the same thing - so how can the obtaining of the relation (belief) depend on how the thing is described?

For these reasons, it seems impossible to regard intentionality as a relation at all. One way of avoiding these difficulties is to distinguish, as Brentano did not, between the intentional object of a state and its intentional content. Intentional content (like Husserl’s *noema* or Frege’s *thought*) is what makes it possible for a mental state to be directed on an object. Thus understood, intentional contents are not representations. Rather, they are what constitute something’s being a representation: it is in virtue of the fact that a mental state has an intentional content that it represents what it does. It is in virtue of the fact that my belief that pigs fly involves some relation between me and an intentional content - the proposition or Fregean thought that pigs fly - that it represents what it does. This is what is meant by saying that intentional states, or propositional attitudes, are relations to propositions or contents (see Propositional attitudes).

Although beliefs, desires and other intentional states are sometimes described in this way - as relations to propositions or contents - this idea should be sharply distinguished from the idea, just discussed, that intentional directedness is a relation. The intentional content expressed by the sentence ‘Pigs fly’ is not what my belief that pigs fly is directed on: the belief is directed on pigs and flying. Some have thought that all intentional directedness can ultimately be reformulated in terms of relations to intentional contents: an intentional state is directed on an object X in virtue of the fact that it is a relation to an intentional content concerning X. However, this thesis has difficulty dealing with certain intentional phenomena, most notably the phenomenon of loving: no one has given a satisfactory reformulation of the notion ’X loves Y’ in terms of X’s relations to intentional contents.

There is much controversy about exactly what intentional contents are and how we should individuate them (see Salmon and Soames 1988). Some philosophers attempt to clarify (or even sidestep) these ontological and epistemological difficulties by adopting what Quine calls ’semantic ascent’: they examine sentences which report intentionality rather than intentionality itself. A distinctive feature of many sentences reporting intentional states is that their constituent words do not play their normal referential role. Part of what this means is that the apparently uncontroversial logical principles of existential generalization (from Fa infer $(\exists x)Fx$) and Leibniz’s Law (from Fa and $a=b$ infer Fb) fail to apply to all sentences reporting intentionality. For example, from ‘I want a phoenix’ we cannot infer that there exists a phoenix that I want; and from ‘Vladimir believes that Orwell wrote *Animal Farm*’ and ‘Orwell is Blair’ we cannot infer that ‘Vladimir believes that Blair wrote *Animal Farm*’ (see Propositional

attitude statements).

Contexts where these two principles fail to hold are known as ’non-extensional’ contexts - their semantic properties depend on more than just the extensions of the words they contain. They are also called ’intensional’ contexts, or contexts which exhibit intensionality (see Intensionality). The connection between intensionality and intentionality is not merely typographical: the failure of existential generalization in intensional contexts is the logical or linguistic analogue of the fact that intentional states can be about things which do not exist. And the failure of Leibniz’s Law is the logical or linguistic analogue of the fact that the obtaining of an intentional relation depends on the way the relata are characterized.

However, the notion of intensionality must be distinguished from the notion of intentionality, not least because there are intensional contexts which are nothing to do with the direction of the mind on an object. Prominent among these are modal contexts: for example, from ‘Necessarily, Orwell is Orwell’ and ‘Orwell is the author of *Animal Farm*’ we cannot infer ‘Necessarily, Orwell is the author of *Animal Farm*’. Other concepts which can create intensional contexts are the concepts of probability, explanation and dispositionality. But it is very controversial to hold that these concepts have anything to do with intentionality.

Another (more controversial) reason for distinguishing between intensionality and intentionality is that intentionality can be reported in sentences which are extensional. Some philosophers have argued that the context ’x sees y’ is like this. Seeing seems to be a paradigm case of the direction of the mind on an object. But if Vladimir sees Orwell, then there is someone whom he sees; moreover, if Vladimir sees Orwell, then surely he also sees Blair, and he also sees the author of *Animal Farm*, and so on. So although seeing is intentional, ’x sees y’ seems to be an extensional context.

3 Intentionality as the mark of the mental

Thus, the notion of intensionality cannot provide a purely logical or semantic criterion of intentionality. We should be content with the psychological criterion: intentionality is the directedness of the mind upon something. As I remarked earlier, Brentano thought that intentionality was the mark of the mental: all and only mental phenomena exhibit intentionality. In discussing this claim - often called Brentano’s thesis - I shall follow analytic philosophers in ignoring Brentano’s own quasi-idealistic use of the term ’phenomenon’. Brentano’s thesis shall be taken as a thesis about the distinction between mental and physical entities in the world.

Is Brentano’s thesis true? We can divide this question into two sub-questions: (1) Do all mental states exhibit intentionality? (2) Do only mental states exhibit intentionality?

(1) It is natural at first sight to think that there are many kinds of mental state which do not have any intentionality. For instance, there are states like undirected anxiety, depression and elation (see Searle 1983: 2). On what are these states directed? Well, I can be anxious without being anxious about anything in particular - but this anxiety is at least directed at myself. Other popular examples of supposedly non-intentional mental states are sensations like pain. But while it may be true that pains are not propositional attitudes - if propositional attitudes are states reportable by sentences of the form ’X φs that p’, where φis a psychological verb - this does not mean that pains are not directed on anything. I could have two pains, one in each hand, which felt exactly the same, except that one felt to be in my right hand, and the other felt to be in my left hand. This is a difference in intentionality - in what the mental state is directed on - so it is not true that pains exhibit no intentionality (see Bodily sensations §2).

However, there are properties of pains which do seem to be wholly non-intentional, such as the naggingness of a toothache (see Qualia). And these properties seem to be essential to pains. This shows that the distinction we need is between those mental states whose whole nature is exhausted by their intentionality, and those whose whole nature is not. Pains are in the latter category, since they seem to have essential non-intentional properties: there are elements of pains which are not exhausted by whatever intentionality those pains may have.

(2) So much, then, for the idea that all mental states exhibit intentionality. But is intentionality only exhibited by mental states? That is: is it true that if something exhibits intentionality, then that thing is a mind? Are minds the only things in the world that have intentionality?

To hold that minds are not the only things that have intentionality, we need an example of something that has intentionality but does not have a mind. This may seem easy. Take books: books contains sentences which have

meaning and are therefore directed at things other than themselves. But books do not have minds.

The natural reply to this is to say that the book's sentences do not have intentionality in themselves - they do not have what some call 'original' intentionality - but only because they are interpreted by the readers and writer of the book. The intentionality of the book's sentences is derived from the original intentionality of the states of mind of the author and reader who interpret those sentences (for this distinction, see Haugeland 1990).

So we can reframe our question as follows: can anything other than minds exhibit original intentionality? One problem with this question is that if we encountered something that exhibited original intentionality, it is hard to see how it could be a further question whether that thing had a mind. The notion of intentionality is so closely bound up with mentality that it is hard to conceive of a genuine case of original intentionality that is not also a case of mentality. If, for example, we could establish that computers were capable of original intentionality, it would be natural to describe this as a case where a computer has a mind.

However, there is an interesting way in which original intentionality and mentality could come apart. Some philosophers want to locate the basis of intentionality among certain non-mental causal patterns in nature. So on this view, there would be a sense in which original intentionality is manifested by things other than minds. This is the hope of those philosophers who attempt to reduce the intentional to the non-intentional: the hope summed up by Jerry Fodor's quip that 'if aboutness is real, it must really be something else' (Fodor 1987: 97).

These philosophers are in effect trying to steer a course between the two horns of the dilemma presented by the passage from Quine's *Word and Object* quoted in §1: you can respond to the Chisholm-Brentano thesis of the irreducibility of intentionality either by accepting an autonomous theory of intentionality and rejecting physicalism, or by denying the reality of intentionality. There are those who are eliminative materialists and who deny the reality of intentionality (see Eliminativism), and there are those who are prepared to accept intentionality as an unanalysed, primitive phenomenon. But the orthodox line among late twentieth-century analytic philosophers is to reconcile the existence of intentionality with a physicalist (or naturalist) world view. This reconciliation normally takes the form of a theory of content: a specification in non-intentional terms of the conditions under which an intentional state has the intentional content it does, or concerns the object(s) it does. A common style of theory of content spells out these conditions in terms of hypothesized law-like causal relations between intentional states and their objects. The model here is the simple kind of representation or meaning found in nature: the sense in which clouds mean rain, and smoke means fire (see Dretske 1980). Causal theories of content hope to explain how the intentionality of mental states is underpinned by simple regularities like these. These theories have had great difficulty accounting for misrepresentation and the normative elements of mental states, and it is this problem that has received most attention in contemporary discussions of intentionality (see Semantics, informational; Semantics, teleological).

Internalism and externalism in epistemology

The internalism-externalism distinction is usually applied to the epistemic justification of belief. The most common form of internalism (accessibility internalism) holds that only what the subject can easily become aware of (by reflection, for example) can have a bearing on justification. We may think of externalism as simply the denial of this constraint.

The strong intuitive appeal of internalism is due to the sense that we should be able to determine whether we are justified in believing something just by carefully considering the question, without the need for any further investigation. Then there is the idea that we can successfully reply to sceptical doubts about the possibility of knowledge or justified beliefs only if we can determine the epistemic status of our beliefs without presupposing anything about which sceptical doubts could be raised - the external world for example.

The main objections to internalism are: (1) It assumes an unrealistic confidence in the efficacy of armchair reflection, which is often not up to surveying our entire repertoire of beliefs and other possible grounds of belief and determining the extent to which they support a given belief. (2) If we confine ourselves to what we can ascertain on reflection, there is no guarantee that the beliefs that are thus approved as justified are likely to be true. And the truth-promoting character of justification is the main source of its value.

Externalism lifts this accessibility constraint, but in its most general sense it embodies no particular positive view. The most common way of further specifying externalism is reliabilism, the view that a belief is justified if and only if it was produced and/or sustained by a reliable process, one that would produce mostly true beliefs in the long run. This is a form of externalism because whether a particular belief-forming process is reliable is not something we can ascertain just on reflection. The main objections to externalism draw on internalist intuitions: (1) If the world were governed by an evil demon who sees to it that our beliefs are generally false, even though we have the kind of bases for them we do in fact have, then our beliefs would still be justified, even though formed unreliably. (2) If a reliable clairvoyant (ones who 'sees' things at a great distance) forms beliefs on this basis without having any reason for thinking that they are reliably formed, those beliefs would not be justified, even though they pass the reliability test.

1 1 Forms of the distinction

Although this entry is restricted to epistemology, the terms 'internalism' and 'externalism' are also used to mark distinctions in ethics and philosophy of mind (see Content: wide and narrow; Moral motivation §1). Within epistemology itself the terms are used variously. The most basic distinction is between views concerning the epistemic justification of belief and views concerning knowledge. As applied to either, *internalism* is construed variously - for example, as the irreducible normativeness of justification (knowledge), and as the view that justification or knowledge always depends on the subject's belief system. The most common understanding, however, is Access Internalism - the view that only what is cognitively accessible to the subject in some strong fashion can have any bearing on justification. We may think of *externalism* as simply the denial of this restriction. Strong cognitive access to a fact is variously conceived; the most common version is that the fact be ascertainable by the subject just by reflecting on the matter. If my justified belief that Susie is in Panama is to justify my belief that she will not be at the meeting tonight, then it must be that I can ascertain by armchair reflection that I justifiably believe that she is in Panama (Ginet 1975: 34; Pollock 1986: Ch. 5, §4.1 offers a quite different way of thinking of the internalist requirement.) Note that this constraint does not require that individuals actually have the knowledge that the alleged justifier obtains, but only that they be capable of acquiring it on reflection.

A crucially important, but usually ignored, distinction is between access to the justifier and access to the epistemic efficacy of the justifier. Consider the perceptual belief that there is snow in front of my house. The justifier, let us say, is my visual presentation as I look out the front window. That would seem unproblematically to satisfy the internalist constraint. But in order for me to know that the belief is justified, it is not enough that I know that my current visual presentation is of such-and-such a character. I must also know that this presentation suffices to justify the belief (that it possesses that 'justificatory efficacy'). And it is far from unproblematic that this is accessible just on reflection. Indeed, many philosophers have struggled in vain to show that our ordinary perceptual beliefs about the immediate environment are justified by the sensory experiences on which they are

typically based. As we shall see, the most common arguments for accessibility internalism give equal support to both kinds of internalist constraint. If one advocates only one kind, we have a mixed view of the sort to be described below.

2 Justification internalism - pro and con

The most explicit arguments for accessibility internalism have proceeded from a deontological conception of justification, according to which a belief is justified only if having the belief does not violate any intellectual obligation or requirement, only if one is permitted to have the belief. In Ginet (1975) the argument goes as follows:

(1) One should believe that *p* only if one is (epistemically) permitted to do so.
(2) One is permitted to believe that *p* only if one has a justification for the belief.
(3) But a condition cannot be required for permission unless one is able to determine whether it obtains.
(4) Hence one can always determine whether one has a justification for a belief.

Note that this argument is designed to support both kinds of accessibility requirement. For to determine 'whether one has a justification for a belief' one must be able to spot both the allegedly justifying condition and also determine whether it suffices to do the job.

One trouble with this argument is that, even if cogent, it does not show that justification must be ascertainable simply on reflection. Its conclusion is only that the subject must be able to know of it somehow or other. In addition, there are serious questions about the deontological conception of justification on which the argument is based: it would seem to assume an unwarranted degree of voluntary control of beliefs (Alston 1989: 115-52).

To be sure, accessibility internalism has a strong intuitive appeal. It has seemed obvious to many philosophers through the centuries that we should be able to determine the epistemic status of our beliefs just by armchair reflection, and that has been the standard method, at least since Descartes shut himself up in a small room to determine whether there was anything he knew with certainty. But intuitive plausibility, even when combined with hallowed tradition, is not enough to bear the weight of so strong a restriction. Moreover, this plausibility stems partly from confusions, particularly that between the activity of justifying a belief and the state of being justified in believing that *p*. The former does seem to presuppose reflective access. At least I cannot adduce a support in justifying (arguing for) my belief that *p* unless I can become aware of that support. But we cannot infer from this that there is the same requirement for being justified in believing that *p*. Obviously, I am justified in many beliefs that I have never engaged in justifying. Otherwise I would have precious few justified beliefs, since I spend little time justifying my beliefs.

Another common motive for embracing internalism is the supposition that it removes an obstacle to giving an effective response to the sceptical denial or doubt that we have any knowledge or justified beliefs. If I have to rely on what I think I have learned from perception, induction, explanation or scientific theorizing, in order to show that certain of my beliefs are justified, then my attempt is open to sceptical challenges to those sources. If I only need to rely on reflection, it is supposed, I do not have this worry. But this line of thought deals only with certain kinds of scepticism. If my only appeal is to reflection, I am immune to challenge from scepticism about perception and induction. But that leaves scepticism about reflection. Though historically most sceptics have concentrated on perception, induction and high level reasoning, some of the classical sceptical arguments would apply to reflection as much as to anything else. Hence internalism provides only a limited guarantee against sceptical doubts (see Scepticism).

The very features of internalism that make it attractive to many also give rise to some serious liabilities. For one thing the position would seem to be much too sanguine concerning the cognitive powers of mere reflection. Here the above distinction between access to the justifier and access to its justificatory efficacy is relevant. Claims to reflective access to the latter are very dubious. Some epistemologists (Chisholm [1966] 1989: 7, 76) exhibit confidence that, just by thinking about the matter, one can tell what justifies what, but I find this very questionable. It partly depends on how we think of justification. The deontological conception may seem more friendly to internalism here. It is easy to convince oneself that one can tell what is permitted to one or required of one just by carefully considering the matter. But if being justified in believing that *p* involves believing in such a way as to be in a strong position to get the truth, then we must deny, must we not, that we are generally able to determine *that*

just by raising the question? Will that tell us, for example, how much and what kind of evidence will put us in a position to get the truth in our scientific theorizing or our religious beliefs?

This issue will recur in the second objection. For now we should note also that not everything is clear sailing *vis-à-vis* access to the justifier. For example, a common type of alleged justifier consists in other justified beliefs of the subject (my belief that my wife is not at home is justified because it is based on my justified belief that her car is not in the garage). But then to know that I have a justifier of this sort I would not only have to know that I have this belief (which may well be accessible on reflection) but also that it is justified. And that brings us back to justificatory efficacy again, namely the issue of what it takes to justify the belief that my wife's car is not in the garage. Again, suppose that a certain belief is justified only if my total evidence (the set of all my justified beliefs) renders that belief probable. Then we also run into the difficulty of determining just by reflection the entire range of my beliefs, and it is doubtful that I can accurately survey *all* my beliefs just by thinking about the matter.

The second objection involves the point just noted that it seems clearly wrong to suppose that we can determine by armchair reflection whether certain (allegedly justifying) conditions render a belief likely to be true. If a belief's being justified implies the probability of its truth, then it follows that anything we can ascertain by reflection will not amount to justification in this sense. And surely this implication of the probability of truth is an essential part of what makes it desirable and important that our beliefs be justified. If this implication is lacking why should we care whether our beliefs are justified? After all, the basic aim of cognition is to believe what is true and to avoid believing what is false. Thus internalism would seem disconnected from any understanding of justification that renders it a major epistemic desideratum.

In the face of these difficulties we should note that there is a weaker brand of internalism on the market, according to which what bears on the justification of belief is restricted to the evidence, reasons or experiences of the subject, in contrast to what is external to the subject's cognitive states (Feldman and Conee 1985). This position is not subject to the objections we have been surveying. But the opposite side of that coin is that it cannot draw on the intuitive support we have seen to accrue to accessibility internalism.

3 Justification externalism - pro and con

In the most general sense, externalism is simply a rejection of the internalist constraint on access. (Externalism can allow reflectively accessible factors, but it denies that what affects justificatory status is *restricted* to them.) Externalism in this generic sense does not include any particular positive view of justification, but it is able to consider various possibilities that internalism blocks. In fact, externalism is always associated with 'strong position' conceptions of justification (believing in such a way as to be in a strong position to thereby get the truth). Since it can recognize conditions of justification that are not reflectively accessible, it is able uninhibitedly to carry out the idea that justification entails truth-conducivity.

The most prominent form of externalism is reliabilism, and in its most common form it holds that a belief is justified if and only if it was produced and/or sustained by a reliable belief-forming process (Goldman 1986) (see Reliabilism §2). A particular perceptual belief, for example, is justified provided it was formed from sensory experience in such a way that when a belief with a content like that is formed from an experience related in that way to the belief content, it will usually be true. A belief formed by inferring a fact from observable indications (believing that a party is going on because one notes a lot of lights on and hears a lot of noise) is justified provided beliefs with that sort of content formed by indications like that will generally be correct. Since the truth-making tendency of a certain process is not something we can ascertain just on reflection, access internalists are not in a position to embrace reliabilism, but externalists are free to do so.

There are many problems one encounters in working out a reliabilist view in detail. For example, how does one assign a particular belief-forming process to a class or type of processes? (note the use of 'like that' in the above examples) (Feldman 1985). And is the reliability a matter of actual track record or a matter of what *would* happen in situations of certain kinds? I will just note here that some views of this kind are formulated in terms of probability rather than in terms of processes. Thus the second example could be put in terms of the probability of a party occurring given that there is a lot of noise, and so on (Swain 1981; Dretske 1981) (see Information theory and epistemology; Probability theory and epistemology §1).

Since externalism amounts to a denial of internalism, it is to be expected that its main supports come from the

difficulties in internalism. The main attraction of externalism lies in the facts that: (1) it enables us to retain the truth-conducivity implication of justification, as internalism does not; and (2) it does not require us to make exaggerated claims for the powers of rational reflection.

The chief criticisms of externalism are based on internalist intuitions and are typically directed against reliabilism. First, there is the consideration of 'demon worlds', worlds controlled by an evil omnipotent demon who sees to it that our beliefs are generally false, even when they seem most obviously true. In such a world one's perceptual, inductive, and mathematical beliefs are false even though one has the same bases for them that we have in the actual world. The denizens of this world believe that there is a tree in front of them when they seem to be seeing a tree in front of them. They believe that 3 + 2 = 5 because it seems self-evident to them, and so on. There is a considerable tendency to judge that these unfortunates would be justified in their beliefs, just as much as we are in ours, even though they are formed in a very unreliable manner. Since they have the same grounds as we do, how can our beliefs be justified and theirs not? But then, reliability of formation is not necessary for knowledge (Foley 1987: Ch. 3). Although this argument is couched in terms of a fantastic scenario, the underlying idea is simple and sober. Since it is conceivable that we have what are recognized as very strong grounds for a belief even though it is not formed reliably, reliability cannot be *necessary* for justification.

Second, consider someone who forms beliefs in a reliable way but who has no, or insufficient, reason for supposing it to be reliable. Again, the argument is frequently presented in terms of *outré* examples like clairvoyance (BonJour: Ch. 3), but more standard cases will do as well. Suppose Jim infers emotional states from outward demeanour and behaviour in the standard way, but has no reason for thinking this to be a reliable way of making such judgments. There is a strong tendency to think that he has no justification for the beliefs so formed, given that this mode of belief formation could be completely unreliable so far as he can tell. But then the mere fact that the way of forming beliefs is reliable cannot be *sufficient* for justification.

The best counter-move for the reliabilist is to deny the 'intuitions' adduced by the critic. No doubt the demon world denizen has something going for them, epistemically, but, says the reliabilist, it is not *justification*, so long as there is nothing about the belief and the way it is formed or held that makes it likely to be true. And since the reliability condition is satisfied for Jim *vis-à-vis* beliefs formed in the usual way about the emotional states of others, that will suffice to render the beliefs justified, despite the lack of higher-level knowledge (justified belief) concerning how reliable that way is. This is to take truth-conducivity as both necessary and sufficient for justification and, as we have seen, this is the heart of epistemic justification from an externalist perspective.

What if Jim not only is not justified in supposing this way of forming beliefs to be reliable, but is justified in supposing it to be unreliable (even though it is reliable)? In that case the reliabilist could recognize Jim's beliefs about the emotional states of others to be *unjustified* - by taking reliability to be sufficient only for *prima facie* justified belief, belief that is justified provided the justification is not overridden in one way or another. In this case, Jim's justification for supposing that way of forming beliefs to be unreliable would be a sufficient overrider. To modify reliabilism in this way would not involve abandoning the basic thrust of the position. Reliability of belief formation would still be at the centre of the picture. It is just that other considerations are given a secondary role.

Various blends of internalism and externalism have been suggested. The distinction between 'justifier' and 'justificatory efficacy thereof' provides an obvious basis for such a combination. Thus Alston (1989: Ch. 9) develops a view ('Internalist Externalism'), according to which a condition can be a justifier only if it is the sort of thing that is typically available to reflection (this is the internalist part), but there is no such reflective access required for the justificatory efficacy of the condition. That efficacy depends on whether the alleged justifier is in fact a reliable indication of the truth of the belief in question (this is the externalist part).

4 The distinction applied to knowledge

As for knowledge, internalism would seem to be less plausible than in application to justification, while externalism is more plausible. This is because of doubts that justification of belief is a necessary condition of knowledge. The dominant view of knowledge in the twentieth century has been that it consists of justified true belief. Since Gettier posed his famous difficulty for this view, those who take true justified belief to be at least sufficient for knowledge have tried to evade these difficulties by adding a fourth condition, but with indifferent

success so far (see Gettier problems §§1-2). If justification were necessary for knowledge, then any constraint on the former would equally be a constraint on the latter, and so accessibility internalism could not be less plausible for knowledge than for justification. But if justification of belief is not necessary for knowledge, we have a different story. More than one prominent externalist has developed a conception of knowledge in which justification is not mentioned at all (Dretske 1981; Nozick 1981). Something like reliability, or probability of the belief on its grounds, is taken as sufficient to turn true belief into knowledge. For example, on Nozick's view the following four conditions are individually necessary and jointly necessary for *S* knowing, via method *M*, that *p*.

(1) *p* is true.
(2) *S* believes, via *M*, that *p*.
(3) If *p* were not true and *S* were to use *M* to arrive at a belief whether (or not) *p*, then *S* would not believe, via *M*, that *p*.
(4) If *P* were true and *S* were to use *M* to arrive at a belief whether (or not) *p*, then *S* would believe, via *M*, that *p*.

Nozick puts this by saying that a true belief counts as knowledge when it 'tracks' the truth, that is, when its being held or not varies with the truth value of the proposition believed. This form of externalism is cut loose from dependence on the right way of thinking of justification, though, of course, its success does depend on the right way of thinking of knowledge. (For some criticisms of Nozick's proposals see Luper-Foy 1987.)

International relations, philosophy of

The philosophy of international relations - or more precisely its political *philosophy - embraces problems about morality in diplomacy and war, the justice of international practices and institutions bearing on economic welfare and the global environment, human rights, and the relationship between sectional loyalties such as patriotism and global moral commitments.*

Not everyone believes that such a subject can exist, or rather, that it can have significant ethical content. According to political realism - a widely-held view among Anglo-American students of international relations - moral considerations have no place in decisions about foreign affairs and international behaviour. The most extreme varieties of realism deny that moral judgment can have meaning or force in international affairs; more moderate versions acknowledge the meaningfulness of such judgments but hold either that leaders have no responsibility to attend to the morality of their actions in foreign affairs (because their overriding responsibility is to advance the interests of their constituents), or that the direct pursuit of moral goals in international relations is likely to be self-defeating.

Leaving aside the more sceptical kinds of political realism, the most influential orientations to substantive international morality can be arrayed on a continuum. Distinctions are made on the basis of the degree of privilege, if any, extended to the citizens of a state to act on their own behalf at the potential expense of the liberty and wellbeing of persons elsewhere. 'The morality of states', at one extreme, holds that states have rights of autonomy analogous to those of individuals within domestic society, which secure them against external interference in their internal affairs and guarantee their ownership and control of the natural and human resources within their borders. At the other end of the continuum, one finds cosmopolitan views which deny that states enjoy any special privilege; these views hold that individuals rather than states are the ultimate subjects of morality, and that value judgments concerning international conduct should take equally seriously the wellbeing of each person potentially affected by a decision, whether compatriot or foreigner. Cosmopolitan views may acknowledge that states (and similar entities) have morally significant features, but analysis of the significance of these features must connect them with considerations of individual wellbeing. Intermediate views are possible; for example, a conception of the privileged character of the state can be combined with a conception of the international realm as weakly normative (that is, governed by principles which demand that states adhere to minimum conditions of peaceful coexistence).

The theoretical difference between the morality of states and a fully cosmopolitan morality is reflected in practical differences about the justifiability of intervention in the internal affairs of other states, the basis and content of human rights, and the extent, if any, of our obligations as individuals and as citizens of states to help redress the welfare effects of international inequalities.

1 The scope of the subject

The philosophy of international relations is the branch of political philosophy devoted to the examination of principles of conduct for the international realm. Historically, such philosophical attention as has been paid to international relations has taken place mainly in three genres: (1) treatises on natural law, 'the law of nations' and international law; (2) the development of a doctrine of 'just' war (often in the context of the law of nations); and (3) the articulation of peace plans - that is, institutional schemes aimed at ending war. There are significant (albeit brief) passages concerning international relations in works devoted primarily to the political theory of the state by most of the important modern writers, including Machiavelli, Hobbes, Locke, Hume, Kant, Hegel, Bentham, Mill and Sidgwick. Among the few works of great stature devoted mainly to international relations, Kant's *Perpetual Peace* (1795) is arguably the most important, but its brevity and epigrammatic style render its normative content elusive.

The paucity of philosophical thought about international relations is not easy to explain, although the burden must fall on the central distinction of the international realm *vis-à-vis* the domestic - namely, the absence of a state-like structure, and consequently of an institutional focus for philosophical speculation. In recent decades there has been an increase in interest in the subject, doubtless reflecting the fundamental changes in the character of international politics and society that have occurred in the mid- and late twentieth century. An intensification of international

and transnational activity, particularly in finance and trade, has given rise to a vast increase in the number of non-state participants in international affairs - including both international organizations (that is, organizations of states) and non-governmental organizations. ‘Total war’ (characterized by the mobilization of entire societies) and the invention of chemical and nuclear weapons have rendered it virtually impossible to contain the harms of war to those who participate in combat, so that the traditional distinction between soldier and civilian has broken down (see War and peace, philosophy of §6). The exploration of space, the exploitation of ocean resources and growing political concern about the environment have spawned policy issues which are essentially trans- (rather than inter-) national. For all of these reasons, the occasion for international philosophy is greater now than at any earlier point in the modern age.

Regarded as a normative enterprise, the philosophy of international relations might be seen as an outgrowth of speculation about the basis and content of the ‘law of nations.’ But this would convey an excessively narrow conception of the subject matter of international philosophy. The law of nations was a body of norms applicable to what was conceived as a society of states whose principal forms of interaction were diplomacy and war. International relations consists of more than the diplomatic and military engagements of states, however. The actors include international and transnational organizations (the latter composed of members which are not states), business firms, and sometimes individuals, and their forms of interaction extend well beyond diplomacy and war - they include commerce, financial transactions and the exchange of information and culture. Such variety gives rise to problems of choice of great complexity and potential moral significance. The consequences of transnational interactions for the global distribution of income and wealth, the movement of human capital in the form of immigration flows, and the quality of the global environment are of particular importance for human welfare. A normative philosophy of international relations adequate to its empirical referent would embrace all of these subject matters.

2 Political realism and international scepticism

Political realism is the name of a collection of views which are often traced to Thucydides, Machiavelli and Hobbes, but whose prominence in modern international thought is due largely to a small number of recent and contemporary students of international relations such as Hans Morgenthau (1946) and George Kennan (1951). The common element is a denial that moral considerations should carry weight in decisions about foreign policy.

The most impressive statement of the realist position was given by Hobbes (1651), who compared the international realm with the state of nature in respect of the absence of a central authority, and concluded that states in international relations have the same freedom from the obligation to follow moral principles (‘laws of nature’) as do individuals in the state of nature. On the Hobbesian view, states are not obliged to comply with moral principles because they have no reason to do so in the absence of a common enforcement agency or effective conventions of reciprocal compliance. At the base of this view is a conception of morality as a mutual benefit scheme, in which individuals comply with principles restricting the direct pursuit of self-interest when and because general compliance with these principles is mutually beneficial in comparison to mutual noncompliance. In this extreme form, political realism is no more than a special case of a familiar type of moral scepticism, which denies that moral judgments can be either reasonable or motivationally efficacious if they are not backed up by considerations of advantage (see Moral scepticism; Moral motivation). If one were to reject this type of moral scepticism, then the form of political realism associated with it would fall by the wayside.

Another form of realism, found more often in the literature of policy than philosophy, holds that leaders of states are not obligated to follow higher-level moral principles because the controlling obligation of their office is to advance the state’s interest. Views of this kind are likely to seem particularly plausible in democratic states, where leaders are elected by the people and their responsibilities are understood as the advancement of the interests of those for whom they act as agents. Unlike the form of political realism considered earlier, this version is not in any obvious sense a type of moral scepticism. Indeed, it acknowledges that leaders of states, and by inference, their constituents can have moral obligations. The challenge faced by anyone who wishes to defend this view is to explain why it should be thought that leaders of states may justifiably do for their constituents what their constituents, as a group, may not justifiably do for themselves.

Another non-sceptical kind of realism, and perhaps the most persuasive of all versions of the view, is best described as heuristic. It does not deny that outcomes in foreign affairs can be appraised in terms of the good and

evil, or that actions and policies can be evaluated in terms of their rightness or wrongness. It holds, however, that outcomes which are desirable from a moral point of view are more likely to occur when foreign policy decisions are screened from the direct influence of moral considerations. The argument for this position is essentially historical: typically, that moral considerations have tended to distort practical reasoning in foreign affairs in a more or less systematic way, and that reasoning which is blocked from the direct influence of such considerations, and whose scope is limited to considerations of interest, has more often led to morally desirable results. In his Lindley Lectures (1951) - a defining document of political realism - George Kennan made an argument of this kind with respect to US diplomacy between the wars. The historical thesis plainly cannot be examined here, but it is worth observing that, even if the thesis turns out to be true, there would be no theoretical challenge to the possibility of international philosophy.

3 The morality of states and the domestic analogy

Assuming that the sceptical challenge can be overcome, the most important problem in international philosophy is the moral status of the state and the character of its relationship to other agents in the world. This problem is implicated in most of the leading normative issues in international relations - for example, the meaning of sovereignty, the permissibility of intervention, the basis and content of human rights, the extent of acceptable restrictions on the movement of persons across borders, entitlements to natural resources, and the obligations of states and their people to provide material assistance to others.

Writing about immigration policy, Sidgwick described a ‘general conflict between the cosmopolitan and the national ideals of political organization’. According to the national ideal, foreign policy should ‘promote the interests of a determinate group of human beings, bound together by the tie of a common nationality’, according to the cosmopolitan ideal, it should strive impartially to promote the interests of everyone, regardless of location or citizenship (1919: 309). The distinction between ‘national’ and ‘cosmopolitan’ ideals is fundamental in contemporary discourse about international ethics.

The dominant view in modern political theory, enduring well into the twentieth century, has been one or another variation of Sidgwick’s ‘national ideal’, or what we might more accurately call ‘the morality of states’. This conception has four distinguishing features. First, the international realm is a ‘society of states’ in which states, rather than individuals, are the principal actors and therefore the subjects of the major rights and duties. Second, states have a moral status analogous to that of individuals in domestic society. In particular, states have rights of territorial integrity and political sovereignty, analogous to the right of individual liberty, which secure their governments against external interference in the exercise of political authority over their territories and populations. Third, states are not generally responsible for the circumstances of outsiders or of other states, and within limits set by the principle of sovereignty, any individual state is entitled to assign priority to advancing the wellbeing of its inhabitants in preference to the equal wellbeing of others. Fourth, there is a high level of tolerance for diversity within the international order: states are not held to a single standard of political legitimacy, and, except perhaps in extreme cases, neither individual states nor the international community are authorized to intervene to protect a state’s people against their own government or to bring about domestic political reform.

The morality of states is a genuine morality: like individual liberty in the domestic case, sovereignty is hardly the same as licence (see Sovereignty). It is, however, peculiar in presuming that a discontinuity exists between the moral order among the individuals who cohabit a single domestic society and the more comprehensive moral order among all the individuals in the world. What can be said for this presumption?

We might begin with the picture of the international realm as a ‘society’ in which states play the roles played by persons in domestic society. This ‘domestic analogy’ is the most influential form in which the morality of states has been articulated, due mainly to the writings of eighteenth-century international jurists like Vattel (1758) and Wolff (1749) (see Wolff §7). Many find the analogy persuasive even today; for example, it is the organizing principle of Michael Walzer’s formulation of the doctrine of the just war (Walzer 1977).

Although influential, the domestic analogy faces notorious difficulties, among which the most serious is that individual persons and the collectivities to which they are compared are such fundamentally different kinds of entities. States, for example, lack the unity of consciousness and the capacity for moral personality which we presume individual moral persons to possess, and so cannot be said to be self-determining in the same sense as

individuals. Indeed, as a general matter, states may not even be identified with the societies they presume to organize and govern; leaving aside the special (and historically unusual) cases of the representative democracies, an indigenous government may stand in as arbitrary a relationship to its own people as would a foreign conqueror. Because states and persons have such different properties, it would be a surprise if it turned out that the reasons for valuing *individual* autonomy also apply to the *state*; and if they do not, the domestic analogy will not do much philosophical work in justifying the morality of states (see State, the).

Most contemporary writers who rely on the domestic analogy to describe an international order in which states have a privileged ethical status appeal to considerations other than the analogy itself to defend the view. Two contrasting approaches deserve particular attention: first, the liberal idea that states' rights of political sovereignty and territorial integrity derive from the underlying individual rights and liberties of their members; second, the communitarian argument that respect for sovereignty enables political communities to preserve their distinctive histories and cultures, and thus to serve the human interests of their inhabitants.

For the first of these arguments, it is necessary to describe the extent and character of the individual rights and liberties which are supposed to serve as the basis of the derivative rights of states. Such a view emerges most naturally from voluntaristic conceptions of the social contract, in which the state is pictured as a free association based on either a historical contract or an ongoing implicit agreement (see Contractarianism). The state's authority to interfere in individual lives would, on such a view, be bounded by the terms of the underlying agreement; and the collective right against interference by outside forces in the internal life of the state would simply be the outward expression of the rights of its members not to be interfered with in their individual lives without their own consent. But the machinery of social contract theory is not really essential. Taking their lead from J.S. Mill (in 'A Few Words on Non-intervention', 1859), those who believe there is an important connection between individual liberty and the sovereignty of states need hold no more than that sovereignty makes individual liberty possible - if only because states serve as bulwarks against conquest by other states and protect a zone where free societies can flourish.

Liberal notions of the state's special status face two kinds of difficulties, which on examination reduce to one. Voluntaristic conceptions are open to the familiar criticism that very few actually existing states can realistically be described as voluntary associations; either the original contract lies too far in the past to exert any normative force in the present, or it is not possible to demonstrate that the prevailing terms of association are the object of a tacit or implicit agreement. Non-voluntaristic conceptions risk overgeneralizing by supposing that individual liberties are better protected through a system of more or less unconditional respect for the sovereignty of states than in a system in which the right of sovereignty is restricted.

The communitarian alternative links the moral status of the state with that of the underlying society. The view develops in two stages. First, it is argued that individuals are unlikely to flourish (or to realize their goods) except as members of communities characterized by at least a minimum level of mutual identification and fellow-feeling. This is only in part because individual human good may involve intrinsically social elements; it is also because the instrumental values of society, such as stability of expectations, can only be realized when there is an unforced disposition to cooperate, and this in turn can only be sustained when individuals identify themselves and each other as members of a common enterprise. Second, it is claimed that individuals are not likely to develop or sustain the requisite level of mutual identification if they are not governed through institutions which they can regard as the political expression of their own community. Again, this is only in part because the motivational force of communal loyalty may arise from a conception of the autonomous community as having intrinsic value; it is also because a community's capacity to defend itself from others and to elicit the necessary degree of contribution from its members will certainly depend on the people's acceptance of their governing institutions (see Community and communitarianism; Nation and nationalism).

The communitarian view assumes that there is some meaningful sense in which states can be seen as expressions of the values of their underlying societies, but this is controversial. Particularly in societies without representative institutions, there may simply be no way to determine whether the existing institutions are expressions of widely shared political values or, instead, legacies of force and fraud. There is a further problem: the communitarian argument trades on an image of domestic societies as reflecting a moral consensus in their communities, a condition that is surely, today, more the exception than the rule. As David Luban has argued (1980), both the

liberal and the communitarian accounts of the state's special status often seem to reflect a romantic idealization that obscures the diversity of state forms in the modern world and the great variation in their degrees of respect for individual rights and liberties.

A doctrine of international morality in which states occupy a privileged position might be defended without relying on any view about the morally special character of the state itself. In fact, some of the most influential views about international morality have this structure. They argue that a world order of states is more likely, on balance, to achieve values of general importance to human beings - a relatively high level of stability and conditions in which groups and societies will face the most favourable circumstances for their own prosperity. Such a generalization would not necessarily be undermined by examples of states whose governments are repressively authoritarian or which enforce exploitative domestic economic arrangements, as long as these examples could be shown to be exceptional. Moreover, views as highly consequentialist as this would have no difficulty, in principle, accommodating principles establishing minimum global standards of political legitimacy such as those found in the international doctrine of human rights.

4 Cosmopolitan morality

Cosmopolitanism stands in contrast to the notion that the boundaries between states, nations or societies have deep moral significance. It holds that each person is equally a subject of moral concern (or, that in the justification of choices of action or policy, the interests of each person affected should be taken equally into account), and that spatial proximity or shared membership are not in themselves sources of moral privilege. On a cosmopolitan view, there is no fundamental moral discontinuity between domestic and international society because states *qua* states have no special standing; if individuals have more extensive responsibilities to their own compatriots than to foreigners, or if states are entitled to be treated with some special respect by others in the international arena, this should be explained in a way that is consistent with the basic conception of a single moral realm in which each individual is equally worthy of concern and respect (see Impartiality).

There is a strong *prima facie* case for cosmopolitanism. For one thing, ordinary morality appears to presuppose its essential premise. Cosmopolitanism applies to the world the maxim that what we should do, or what institutions we should establish, should be decided on the basis of an impartial consideration of the claims of each person who would be affected by our choices. In one or another form, this maxim, although not beyond philosophical criticism, is a mainstay of the political moralities found in virtually all contemporary democratic cultures. Moreover, as the discussion in §3 suggests, the morality of states - cosmopolitanism's major rival - is difficult to maintain as a distinct view once the special status assigned to the state is brought into question; indeed, the most plausible explanation of the right of sovereignty may be an application of cosmopolitan principle rather than an alternative to it.

Against these considerations, there are at least three sources of doubt about cosmopolitan moralities. First, such views can seem either pallid or otherworldly in their apparent failure to connect with recognizable sources of motivation (for example, local affiliations or patriotic loyalties). Second, and relatedly, cosmopolitanism can appear to be too demanding, imposing requirements on individual conduct which may properly be described as heroic. Finally, these views can appear politically innocent, inviting an effort to build global political structures (a 'world government') that would do more harm than good.

The most common reply to these doubts is to argue they rest on an excessively simple interpretation of cosmopolitanism. In response to the first point, for example, it might be noted that cosmopolitan views are no more remote than most other moral doctrines from recognizable sources of motivation; although there is certainly a question about the capacity of cosmopolitan reasons for action to influence the will, this question is not different or more complex than the same question raised about the more familiar versions of Kantianism and utilitarianism. It is not possible to reply to the second objection without considering the normative consequences of cosmopolitanism; but it is worth noting that the view need not be interpreted as a doctrine of individual conduct, and indeed, that its most natural interpretation is instead as a view (or family of views) about institutional policy, in which case the objection is out of place. Finally, cosmopolitanism need not make any assumptions at all about the best political structure for international affairs; whether there should be an overarching, global political organization, and if so, how authority should be divided between the global organization and its subordinate political elements, is properly understood as a problem for normative political science rather than for political

philosophy itself. Indeed, cosmopolitanism is consistent with a conception of the world in which states constitute the principal forms of human social and political organization; the central question is whether this conception or some feasible alternative would be preferred when the matter is regarded from a perspective in which the interests of all are equally represented.

Although formally consistent with a state-based conception of world order, any plausible version of cosmopolitanism is likely to differ substantively from familiar versions of the morality of states. Consider, for example, the question of intervention. Because it assigns a high value to state sovereignty, the morality of states takes it as a settled matter that states, coalitions of states, and international agencies should refrain from interfering in the internal affairs of individual states, except in certain well-defined, exceptional cases, chief among which is intervention in self-defence. In the aftermath of Nuremberg, intervention to end shocking and egregious practices such as genocide has come to be accepted as well (although such an exception, because it presupposes an attenuated principle of sovereignty, fits uncomfortably with the morality of states). Cosmopolitanism, on the other hand, is likely to be less suspicious of intervention in principle, and to admit the possibility that intervention for protective and remedial purposes might be justified; on a cosmopolitan view, the most important questions about intervention are pragmatic, having to do with the chances that intervention would accomplish its legitimate purposes without doing unacceptable collateral harm.

Or consider the question of international distributive justice (see Justice, international). In its traditional form, the morality of states must regard a state’s involvement in the relief of material suffering elsewhere as a matter of charity or mutual aid. This is because the principle of sovereignty functions not only to protect a society against interference in its own political and social affairs, but also as a kind of collective property right: it secures a state against non-consensual deprivations of the resources and wealth to be found on (or under) its territory. Understood more abstractly, it conveys a conception of domestic societies as bearing the primary responsibility for their own development, and of social wealth as deriving more significantly from the collective efforts of previous generations in a single society than from that society’s good fortune in the distribution of natural and genetic resources and in the favourable prior course of political and social history. A cosmopolitan view, again in contrast, would begin with a conception of the world as a single human community. It would be unlikely to regard states as having privileged claims to the accumulation of social wealth unless institutions embodying such a recognition were the best feasible means to realize the requirements of whatever principles of distributive justice, themselves global in their scope, would be preferred from a point of view in which everyone’s interests were represented.

Between the morality of states and moral cosmopolitanism, a variety of intermediate positions might be identified. The most interesting of these are two-tiered views which combine acceptance of a minimum global standard of conduct with tolerance of substantial diversity above the minimum. Such views vary according to the content of the global minimum - whether, for example, it includes significant standards of domestic legitimacy (are states required to respect the human rights of their people?) or significant expectations of participation in schemes involving the international transfer of wealth (are states required to contribute to famine relief or international development efforts?) A good example of such a view is the revisionist doctrine of a ‘law of peoples’ recently set forth by John Rawls (1993).

5 Human rights

As an element of the discourse of international affairs, the doctrine of universal human rights is a legacy of the settlement of the Second World War. As a philosophical matter, however, the notion of a human right is ancient, its universalistic strand running to the Stoics and its deontological structure dating at least to the early modern notion of natural right.

The underlying idea is that all human beings, simply because they are human beings, are entitled to be treated according to certain minimum standards. Very extensive statements of the content of this doctrine can be found in the Universal Declaration of Human Rights, adopted by the United Nations in 1948, and in several human rights covenants adopted by the United Nations and various regional organizations. There is little dispute in contemporary public discourse about either the grounding or the content of human rights doctrine.

There is, however, very little agreement among philosophers about any of the major theoretical questions concerning human rights (see Rights §5). Philosophers disagree, for example, about the grounding of human

rights, particularly the sense in which these rights can be said to pertain to human beings 'as such'; their extent, particularly whether human rights include, in addition to the standard individual liberties, civil and political rights and rights to a minimum standard of living; about the priorities among human rights, a question which is especially vexed if their extent is taken to be relatively broad; and about the relationship between human rights and other moral values. The doctrine of human rights did not receive sustained theoretical attention until the late 1970s and 1980s; the most notable contributions are due to Henry Shue (1980) and R.J. Vincent (1986).

The doctrine of human rights is chiefly important in international philosophy as an embodiment of the notion that there are universal minimum standards of political legitimacy - that is, standards to which all societies are responsible. To put it slightly differently, the doctrine of human rights sets a limit to the extent of acceptable diversity among the political constitutions of states. As such, human rights doctrine might be seen from one perspective as the entering wedge of cosmopolitan thought, or, from another, as the price that statist conceptions must pay for their plausibility. Either way, human rights doctrine is the most familiar form in which two-tiered theories of international morality present themselves, and perhaps the most likely avenue for the future development of international philosophy.

Interpretation, Indian theories of

Need for interpretation of texts was felt already during the ancient period of Vedic texts in India. Vedic texts were orally transmitted for over a thousand years. During this period, the change in locations of people reciting the texts and the mother tongues of the reciters led to a widening gap between the preserved sacred texts and their interpreters. Additionally, there was a notion that the sacred language was a mystery which was only partially understood by the common people. This led to the early development of exegetical tools to assist the interpretation of the sacred literature.

Later, grammarians and etymologists developed sophisticated exegetical tools and theories of interpretation. These generally led to a deeper understanding of the structure of language. The priestly tradition developed its own canons of interpretation, which are manifest in the system of Mīmāṃsā. Here we have the first fully developed theory of discourse and context.

The categories developed by Mīmāṃsāwere used by other schools, especially by the school of Dharmaśāstra, or Hindu religious law. Both Mīmāṃsāand Dharmaśāstra created sets of hierarchical principles for authoritative guidance in interpretation. Other philosophical and religious traditions developed categories of their own to deal with problems of interpretation. A major problem was created when the literature accepted as authoritative by a tradition contained apparently contradictory passages. The traditions had to deal with this problem and find ways of explaining away those passages which did not quite fit with their own view of truth. For this purpose, a whole set of categories were employed. At a later period, several ingenious principles of interpretation were used for texts in general. Here, significant contributions were made by the traditions of Sanskrit grammar and poetics.

1 Text and interpreter

Concern for the interpretation of the scriptural language was already being voiced in India from the earliest period of the Vedic scriptures (*c.*1500 BC). The primary reason for such concern lies in the real or perceived distance between the language of a sacred text and the contemporary language of the person trying to comprehend and use that text. Real distance between the language of a sacred text and the language of its interpreter or user can be caused by various factors, such as temporal and geographical distance, linguistic change in the sacred language, shifts in the mother tongues of the text's preservers, and corruption and loss in the text in the course of oral or written transmission. The middle Vedic texts already express a concern that the users of language are unable to pronounce proper accents. The loss of this ability contributed to improper use of sacred formulas, as well as to misinterpretation of their meaning. We are told a story about a demon who seeks a son who will kill the god Indra. He should ask for a son who will be *indraśatrú*, 'killer of Indra'. However, the ignorant demon uses a wrong accent and asks for a son who will be *índraśatru*, 'he whose killer is Indra'. This story is later repeated by Sanskrit grammarians and etymologists to illustrate the importance of a proper understanding of accents. Similarly, in the oral tradition, long stretches were memorized and recited in an unbroken fashion. Besides actual cases of mutilation and alteration of the text, such recitation resulted in multiple possibilities for dividing up the text.

Ideas regarding the nature of the sacred language contributed an additional feeling of distance between text and interpreter. The *Ṛg Veda* tells us that language, in reality, is measured in four quarters, all of which are known to the wise, insightful priests. However, three quarters of speech are hidden away from common people, who have access only to a single quarter. The goddess of speech is said to reveal her true form only to a person of her own choice. Another important notion is that the gods do not like the direct mode of expression (*pratyakṣa*). They would rather have sacred expressions in an indirect mode (*parokṣa*). Middle Vedic prose texts often explain the so-called indirect expressions by paraphrasing them with expressions which have structures more transparent to their audience.

2 Early tools to assist interpretation

In the middle (*c.*1000 BC) and late (*c.*700-500 BC) Vedic periods, we find a growing concern for proper understanding of older texts and the beginning of concerted efforts to develop technical tools towards that goal. For the Brāhmaṇa texts, the highest perfection (*rūpasamṛddhi*) of ritual results when the recited Vedic text matches the ritual action. This places a high premium on comprehending the meaning of the recited texts before

one decides how and when they are to be used in ritual. The texts repeatedly state that the man who performs a ritual ‘knowingly’ (*ya evaṃ vidvān*) will be rewarded.

There was also a serious effort by priest-scholars such as Māṇḍūkeya and Śākalya to put together the Padapāṭhas, ‘word-by-word’ versions of Vedic texts. The late Vedic text *Aitareya-Āraṇyaka* speaks of *nirbhuja* (‘unsegmented’) versions versus *pratṛṇṇa* (‘segmented’, ‘broken-down’) versions. Later on, the segmented versions were used as the basis for reproducing continuous versions (*saṃhitā*) which were deemed to match the originals. These activities provided an enormous opportunity to build formal tools to assist interpretation, a task taken up later by the grammarians, etymologists and phoneticians of ancient India.

3 Etymologists and grammarians

The goal of the etymologists was to provide insight into the meaning of an expression (*nirvacana*) by providing an analytical breakdown of it. Yāska, the author of *Nirukta (Analytical Exegesis*, *c*.500 BC), the only surviving ancient text on etymology, says that comprehension of meaning is the highest goal of his science. Without comprehension of meaning, one cannot break down a continuous Vedic text into its constituent words, nor can one know the proper ritual application for such a text. He criticizes the reciters of Vedic texts who do not care for meaning. He refers to Kautsa, who argued that the Vedas are devoid of meaning. Yāska refutes Kautsa’s arguments and proposes a number of methods for etymology:

> Now we shall deal with etymology. In this context, words whose accent and grammatical form are regular and have a transparent modification of the formative elements should be explained in the regular manner. However, [for other words,] where the meaning is unclear and the modifications of the formative elements are not transparent, one should always analyse them by focusing on their meaning, by the analogy of some shared action [with another word]. If no such analogy is found, one should explain [words] even by the commonality of a single syllable or sound; but one should never give up an attempt at etymology.
>
> (*Nirukta* 2.1)

While the etymologists were busy offering a breakdown of difficult Vedic expressions, they were clearly aware of a different tradition, namely the tradition of grammar (*vyākaraṇa*). In Yāska’s terminology, this reverse process, called *saṃskāra*, consists of building up words by fusing their formative elements and putting them through a series of modifications (*vikāra*). This is the pattern followed in the famous ancient grammar of Pāṇini. It extensively uses the term *artha*, ‘meaning’, and yet its goal is not interpretation *per se*. It is an encoding grammar rather than a decoding grammar. It begins with the meaning to be communicated and with morphological primes such as roots, stems and affixes. Through a series of steps involving affixation, substitution, modification, and so on, it builds up a surface expression in Sanskrit that corresponds to the intended meaning.

However, Pāṇini’s successors, Kātyāyana and Patañjali, clearly see the value of his grammar as a tool for the preservation and comprehension of the Vedic scriptures. They argue that the usage of Sanskrit backed by an understanding of grammar leads to success in life here and hereafter. The grammarians are dealing with a stage of Sanskrit when it is no longer a first language, and needs to be acquired by a deliberate study of grammar. Among the purposes of the study of Sanskrit grammar, Patañjali includes several which relate to one’s ability to interpret the scriptural texts properly. One of these purposes is *asandeha*, ‘removal of doubts’. Besides mentioning the old *indraśatrú* example, Patañjali cites one more case, *sthūlapṛṣatī*. This word describes a cow that is supposed to be sacrificed. If it is accented as *sthūlapṛṣatī́*, then it can be interpreted as a Karmadhāraya compound to mean ‘a cow that is fat and spotted’. However, if it is accented as *sthūlápṛṣatī*, then it becomes a Bahuvrīhi compound and means ‘a cow that has fat spots’. A person who does not know the accents or what the difference in accent leads to will not be able to interpret the ritual prescription properly. For Patañjali, studying the Vedas without comprehending their meaning is as futile as throwing firewood away from fire. How can it possibly catch fire?

4 Mīmāṃsāprinciples of interpretation

The tradition of Mīmāṃsāsystematizes the rules of interpretation as they apply to the ritual use of Vedic texts, as well as to the performance of ritual as understood from those texts. Here the term ‘Veda’ applies to both the mantras and the prose Brāhmaṇa commentaries. For Mīmāṃsā, the Vedas are entirely uncreated, not authored either by humans or by God, yet are fully meaningful and authoritative (see MīmāṃsāČsect;3). Given this eternal

innate authority of the Vedic texts, Mīmāṃsāprovides a set of six hierarchical principles of interpretation, the earlier ones overriding the later ones: (1) direct statement (*śruti*); (2) word-meaning (*liōga*); (3) syntactical connection (*vākya*); (4) context (*prakaraṇa*); (5) position in the text (*sthāna*); (6) name (*samākhyā*).

Let us consider the conflict between the first two guiding principles. Verse 8.51.7 of the *Ṛg Veda* describes the divinity Indra. On the basis of the word-meaning (*liōga*), one would think that this verse should be used while making an offering to Indra. However, a direct statement (*śruti*) in the *Taittirīya-Saṃhitā* (1.5.8), another Vedic text, says that one makes an offering to Gārhapatya fire by using a verse addressed to Indra. This direct statement overrides what one would otherwise decide on the basis of the meaning of the particular verse.

Besides these six principles, Mīmāṃsāalso deals with numerous important issues relating to Vedic interpretation, such as cases where one finds seemingly contradictory statements in the Vedic corpus. How, for example, does one deal with a statement authorizing a Niṣāda chief to perform a certain sacrifice? The tribal people referred to by the term ‘Niṣāda’ are generally beyond the pale of those eligible to perform sacrifices to Vedic gods. If the word ‘Niṣāda-chief’ is taken to mean ‘one who is a Niṣāda and a chief’, this authorization conflicts with the general prohibition of low-caste people taking part in Vedic sacrifices. However, if it is taken to mean ‘a chief of the Niṣāda’, it could possibly apply to a person who is not a Niṣāda, yet is their chief. The Mīmāṃsakas try to resolve such issues. Where there is ultimately no way to choose between contradictory Vedic injunctions, Mīmāṃsāadvises an optional choice, for example, between ‘One uses the Ṣoḍaśīcup in the Atirātra sacrifice’ and ‘One does not use the Ṣoḍaśīcup in the Atirātra sacrifice’. Considering the entire Vedic corpus to be fully authoritative leads to rejection of its historical and geographical diversity. This rejection gives rise to many more instances of apparently contradictory statements.

5 Other philosophical traditions

Acceptance of the entire Vedic corpus as authoritative requires the reconciliation of a large number of apparently contradictory statements. However, the problem is not unique to Mīmāṃsā. Bādarāyaṇa, in his *Brahmasūtra*, uses the term *samanvaya* (‘coordination’, ‘reconciliation’) for the technique of reconciliation. While Mīmāṃsādeals largely with ritual injunctions, Bādarāyaṇa is concerned with the apparently divergent views regarding the ultimate reality of Brahman in the Upaniṣads. The commentators on the *Brahmasūtra* are faced with the same dilemmas, which get more complicated with every generation. Beginning with Śaōkara, the tradition of Vedānta adopts the view that it is founded on three authoritative sources (*prasthānatrayī*), namely the Upaniṣads, the *Brahmasūtra* and the *Bhagavad Gītā*. The principle of *samanvaya* needs to be expanded to all these texts. With Rāmānuja and Madhva, the Purāṇas and the texts of the Pāñcarātra tradition are also added to this pool of authoritative texts. Commentators often create a deliberate hierarchy among different texts, or among different passages from the same text. Then they conveniently argue that some of these texts are to be taken literally (*mukhyārtha*), while others are to be interpreted metaphorically (*lakṣaṇā*). Another dichotomy among texts is stipulated by suggesting that different texts or passages are meant for different audiences, and that these audiences, having different intellectual and spiritual abilities, need suitably different teachings. Some teachings are meant for those who are truly capable, while others are meant to be provisional teachings for those who have not yet arrived at the same high level. Such distinctions are found also in the Jaina and Buddhist traditions (for example, the *upāya*/*upeya*, *vyāvahārika*/*pāramārthika* and *neyārtha*/*nītārtha* distinctions, all of which correspond respectively to ‘provisional’ and ‘true’). With such tools, one can extract a uniformity of teaching from texts which apparently do not have it. The tradition of Dharmaśāstra, religious law, attempted to eliminate similar apparent conflicts between various texts by saying that some were restricted to certain periods of time, regions or social classes.

6 Principles of interpretation in Hindu law

Dharmaśāstra provides an important set of hierarchical guidelines for interpration. Authorities include the Vedas, the Smṛtis (law books), the behaviour of the elites in the community, and, finally, one’s own judgment. According to this tradition, and most of the wider Indian tradition, the authority of the Vedic texts overrides that of the Smṛtis. While the Vedic texts are either uncreated or created by God, the Smṛtis are said to be authored by human scholars and are believed to be based on the Vedic texts. The behaviour of the elite leaders of the community is presumed to be based on the Vedas and the Smṛtis. When there is no access to any other authority, one has recourse to one’s own conscience (see Duty and virtue, Indian conceptions of §2).

In fact, some early Dharmaśāstra texts say that there were no prescriptions in the Vedas (*śrutyabhāvāt*) regarding the laws that govern different regional, caste and family traditions, and, for that reason, the ancient lawgiver Manu explained these topics. However, along with the tradition of Mīmāṃsā, Dharmaśāstra argues that this simply means that the Vedic texts dealing with such topics are lost, and not that they did not exist. The existence of lost Vedic texts (*anumitaśruti*) is inferred on the basis of statements in the Smṛtis. In general, while the Dharmaśāstra theory lays great emphasis on the Vedas as the ultimate basis for authority, in reality the interpretation of the Vedas gets pulled in the direction of contemporary beliefs and practices.

7 Generalized principles of textual interpretation

Coming back to the wider context of textual interpretation, we find a number of important initiatives. In the tradition of Sanskrit grammar and in the traditions relating to Brahmanical ritual and law, there is a large literature called Paribhāṣā, 'Maxims of Interpretation' (see Abhyankar 1968). In the context of rules of Sanskrit grammar, these maxims help account for the derivation of certain forms, by effectively extending or narrowing the scope of a rule through interpretation. Generally there is great reluctance to alter the wording of a rule or offer a new rule. The tradition would rather get a new ruling by reinterpreting an old one. In doing this, the commentators have recourse to a great many interpretive techniques (see Kielhorn 1887). Related to the Paribhāṣāliterature is the device called *nyāya*. In this context, the term refers to a proverbial statement of colloquial (*laukika*) or technical (*śāstrīya*) wisdom. For example, when two events have no genuine relationship, but are merely coincidental, one cites the *kākatālīyanyāya*, which refers to a story of coincidences, such as the following: a person is resting under a palm tree; a crow flying over the tree comes and sits on a palm fruit; the weight of the crow causes the fruit to fall and crack the person's head. There are a large number of these traditional *nyāyas* (see Kane 1977).

The fifth-century grammarian Bhartṛhari, in his *Vākyapadīya (On Sentences and Words)*, provides a catalogue of many guiding principles of interpretation:

> Meanings of words are differentiated on the basis of the sentence [in which they occur], the context, the meaning [of other words in the context], propriety, time and place [of utterance], and not merely on the basis of the form of a word. Connection, separation, association, opposition, meaning, context, indication, presence of another word, suitability, propriety, place, time, gender, and accent, etc. are the factors which help to determine a specific meaning, in the absence of [natural] clarity of meaning.
>
> (*Vākyapadīya* 2.314-16)

Many of these ideas are carried over into the tradition of Sanskrit poetics, which aims at explaining how one understands the aesthetically pleasing significance of poetry. The notion of interpretation is crucial in all discussions in this tradition. While the lexical meaning of words may be taken for granted, there is a wide gap between lexical meaning and intended meaning. In discussing the phrase 'the cowherd colony is on the river Ganges', we are told that we move away from the literal meaning because of the difficulty of construing the literal meaning (*anvayānupapatti*) and the difficulty of justifying the literal interpretation in view of the intention of the speaker (*tātparyānupapatti*). Nudged by these two factors, we move to the meaning 'the cowherd colony is on the bank of the river Ganges'. Beyond this comes the level of implied or suggested meaning, which may or may not match the meaning intended by the speaker. A listener often understands far more than what the speaker intends. Such levels of suggested and implied meanings are further accounted for through the suggestive function of language and/or inference.

Introspection, epistemology of

If we wish to know what is going on in someone else's mind, we must observe their behaviour; on the basis of what we observe, we may sometimes reasonably draw a conclusion about the person's mental state. Thus, for example, on seeing someone smile, we infer that they are happy; on seeing someone scowl, we infer that they are upset. But this is not, at least typically, the way in which we come to know our own mental states. We do not need to examine our own behaviour in order to know how we feel, what we believe, what we want and so on. Our understanding of these things is more direct than our understanding of the mental states of others, it seems. The term used to describe this special mode of access which we seem to have to our own mental states is 'introspection'.

A view which takes its inspiration from Descartes holds that introspection provides us with infallible and complete access to our states of mind. On this view, introspection provides us with a foundation for our knowledge of the physical world. On this view we come to know the physical world by first coming to recognize certain features of our mind, namely, the sensations which physical objects excite in us, and then drawing conclusions about the likely source of these mental states. Our knowledge of the physical world is thus indirect; it is grounded in the direct knowledge we have of our own minds. The view that introspection provides an infallible and complete picture of the mind, however, is no longer widely accepted.

Introspection has also been called upon to support various metaphysical conclusions. Descartes argued for dualism on the basis of introspective evidence, and certain contemporary philosophers have argued in much the same spirit. Hume noted that introspection does not reveal the presence of an enduring self, but only a series of fleeting perceptions; some have concluded, therefore, that there is no enduring self.

Philosophers concerned with self-improvement, whether epistemological or moral, have frequently called upon introspection. Introspection has been thought to aid in forming beliefs on the basis of adequate evidence, and it has been used as a tool of self-scrutiny by those concerned to understand and refine their motivations and characters.

1 The complete transparency view

Precisely what Descartes believed about introspection is a subject of some controversy (see Descartes, R.). Nevertheless, we may describe a view for which there is substantial textual support and which has historically played an important role. The powers of introspection, on this view, are considerable. First, introspection is held to be infallible. Thus, for example, if I believe that I am experiencing a mild headache, then I am experiencing a mild headache. Second, this infallibility is not merely a matter of psychological law, something which could have been otherwise; instead, it is a matter of necessity. The very idea of introspective error is incoherent. Finally, introspection provides one with a complete picture of the contents of one's mind. There can be nothing in the mind which may escape its notice. The picture one gets of one's mind when one introspects is thus both complete and completely accurate.

In all of these respects, introspection contrasts quite sharply with our ability to know the world outside our minds. We can and, of course, do make errors in our judgments about the world around us. We may sometimes think that a certain book is on the shelf, but on trying to take it down discover that what seemed to be a book is merely an empty dust-jacket. When it comes to physical objects, appearances sometimes deceive. Our mental states, however, cannot fail to be precisely as they appear to us. By the same token, our picture of the world around us is fundamentally incomplete; we simply do not know everything there is to know about it. Our mental life, on the other hand, is wholly transparent to introspection. It would be incoherent, on Descartes' view, to suppose that one might be in a certain mental state without its being accessible to introspective attention.

Introspection is not merely superior to perception in Descartes' view, however; instead, introspection is a prerequisite for perceptual knowledge. We perceive the external world only indirectly. By way of introspection, we gain direct access to our mental states. Having made note of our mental states, we may then attempt to infer what external objects, if any, might have made such impressions upon us. The self-knowledge achieved through introspection thus forms an infallible foundation upon which we may attempt to build our understanding of the external world. The evidence we have for the existence and character of the external world is fully provided for us

by way of introspection. Introspective knowledge is, on this account, epistemically prior to all knowledge of the external world.

This view of introspection gives rise to a number of epistemological problems which have been pursued with great vigour since the time of Descartes. First, and most obviously, there is the problem of explaining how it is that the knowledge we have of our own mental states can, by itself, provide sufficient evidence for beliefs about an external world of physical objects (see Scepticism). Second, there is the problem of other minds, that is, the problem of explaining how the knowledge we have of the behaviour of others can provide sufficient evidence for beliefs about their mental states (see Other minds). Third, there is a problem about our knowledge of the past and the future. Since introspection provides us with knowledge of our current mental states alone, we must somehow find sufficient evidence in our knowledge of the present instant to ground claims about other times. Although Descartes raised and addressed only the first of these three problems, they are really variations on a common theme. In each case, there is thought to be only indirect access to certain potential objects of knowledge: in the first, physical objects; in the second, mental states of other people; in the third, the past and the future. One needs to develop hypotheses about these things, but the truth or falsity of one's hypotheses cannot be directly checked against the facts, since one has no direct access to them (see Inference to the best explanation). Some have argued that these problems are resolvable, that indirect evidence of the relevant facts is evidence enough. Others have argued that the problems are insurmountable, and that a very broad scepticism is thus forced upon us; we are left with knowledge of nothing but our current mental states. Still others have suggested that because the Cartesian approach inevitably leads to such radical scepticism, we should reject the premises which raised these difficulties in the first place.

2 Transparency and the contemporary scientific view of the mind

There are, however, problems for the transparency view in any case. It is quite clear that introspection does not give us total access to our current mental states. Moreover, once we recognize that the picture introspection presents is inevitably incomplete, it is but a small step to recognizing the fallibility of introspection as well.

The strengths and limitations of Descartes' view may best be understood by first examining a view which attributes even greater powers to introspection than did Descartes. Let us thus consider the view that mental phenomena are not merely accessible to introspection, but instead that they must actually be present to consciousness if they are to exist. On this very strong view, the idea that one might have memories (in the mind) which are not current objects of introspective awareness is a mistake. But how can one then account for the ability to recall past events? The simple phenomenon of memory retrieval becomes mysterious if one cannot allow for mental occurrences which are not conscious.

Far more plausible is Descartes' suggestion that mental phenomena are essentially introspectable, that is, that they are potential objects of introspection, rather than that they must actually be introspected in order to exist. On this view one may countenance the existence of memories and other mental states generally, which are not current objects of introspective awareness, so long as they may be brought to consciousness. It is clear enough that some memories may only be brought to consciousness with great difficulty. The mere inability to introspect some mental item on a particular occasion, even after great effort, is thus insufficient to show that it does not exist. Mental phenomena might easily escape one's introspective notice on such a view; they need only be accessible to introspection in principle.

Even this view, however, is almost certainly false, although the reasons for thinking so were not available to Descartes. Work in experimental psychology has for some time now required the postulation of mental states which are not accessible to introspection. Two brief examples should suffice to make the point. First, in order to explain our responsiveness to features of the environment of which we are not consciously aware, it is necessary to postulate mental mechanisms which register information about the environment and integrate this information with other facts to which we are sensitive. No amount of introspective attention can acquaint us with the operation of these mental processes or the contents of the mental states which register the information on which they draw. Second, as Noam Chomsky's work has shown, the process of language acquisition involves the generation and testing of detailed hypotheses about the structure of the language spoken around one; language use requires that the rules of one's language be mentally represented (see Chomsky, N). These hypotheses and rules, however, while explicitly represented in the mind, are not accessible to introspection. No amount of introspective scrutiny

can acquaint us with any of these features of the mind.

The picture of the mind which is thus emerging from work in experimental psychology and psycholinguistics is quite different from that portrayed by Descartes. On Descartes' view, theorizing about the mind is unnecessary because the data provided by introspection already encompass all that there is to the mind. In this respect, psychology contrasts with the other sciences where theories need to be constructed to explain the data collected, and entities and processes need to be postulated to account for the regularities in observed phenomena. Current work in psychology, however, presents the mind as an object of study as fit for theorizing as those in any other science and, indeed, as requiring theoretical investigation if it is to be properly understood. Indeed, once we recognize the existence of memories which are not current objects of awareness, we have taken the first step in theorizing about the mind. On current accounts, introspection gives us access to only a very small corner of the mental world - comparable to the access unaided vision provides us to chemical phenomena. By far the greatest part of our mental life is simply inaccessible to introspection.

One might think that although current work in psychology undermines Descartes' view that introspection gives us access to a complete account of the mind, it leaves his claim that introspection provides an infallible guide to the mind, at least as far is it goes, untouched. This is not, however, the case. Once it is acknowledged that the mind is a fit object of scientific theorizing, it becomes impossible to insulate the judgments of introspection from the encroachment of theory. Introspection provides people with a certain perspective on their mental states. It is but one perspective, however. Our best available theories of the mind draw on other sources of information as well, and may in principle provide us with reasons for thinking that the perspective provided by introspection is not always an accurate one, just as our best available theories of vision may allow us to recognize situations in which visual appearances are likely to mislead. In the case of introspection, as with vision, one need not appeal to subtle work in experimental psychology to see its fallibility at work. The fallibility of introspection is not merely a theoretical possibility, but a fact of everyday life.

Works of literature have long portrayed characters whose introspective understanding of their own mental states fall far short of perfection, not merely by being incomplete, but by being inaccurate as well. Failure to recognize accurately one's own emotions, desires, beliefs, motivations and traits of character are all familiar. Indeed, it is simply a part of the common-sense conception of the mental that introspection is subject to error in making these kinds of judgments. The current experimental literature in psychology both supports and deepens this common-sense view. Introspective judgments of current mental states simply are not infallible. This is not to say, of course, that introspection cannot provide us with knowledge of our own mental states, for, at least on most views, knowledge does not require infallibility.

The limitations of introspection were recognized by Kant in the *Critique of Pure Reason* (1781/1787): introspection, according to Kant, 'represents to consciousness even our own selves only as we appear to ourselves, not as we are in ourselves' (B153).

3 Cartesian projects in contemporary perspective

Even if we acknowledge that introspection provides neither a complete nor a completely accurate account of the mind, it is not obvious what implications this has for the Cartesian doctrine of the epistemic priority of self-knowledge - that is, the view that knowledge of one's own mental states is in an important sense prior to knowledge of the physical world. Many have suggested that this last Cartesian doctrine survives the downfall of the others, and that the projects to which it gives rise must still be carried out, although perhaps with some minor modifications. Others have argued that the doctrine of the epistemic priority of self-knowledge must fall with the other Cartesian doctrines, and that the projects to which it gives rise are thereby completely undermined.

One project which is clearly undermined is the constructive project of radical foundationalism. The radical foundationalists, following Descartes, sought to provide empirical knowledge with an infallible foundation. On this view, a belief is shown to be justified either by showing it to be infallible or by appropriately basing it on a foundation of infallible beliefs. Because the foundation consists of beliefs about which mistakes are impossible, it can need neither revision nor correction in light of new information. Introspection was thought to provide such a foundation of judgments about the current contents of one's mind. The fallibility of introspection, however, clearly vitiates this project by robbing it of the required foundation. This need not, of course, be taken to show that radical

foundationalism provides a mistaken account of the requirements for justified belief. Rather, it shows that the requirements which radical foundationalists set out cannot be met. Thus, either radical foundationalism does not correctly lay out the requirements for justified belief, or scepticism about the external world is inevitable.

The constructive projects associated with weaker versions of foundationalism, however, are not so obviously undermined. Introspection might be thought to provide one with a fallible foundation for one's beliefs about the physical world. Such a foundation would be subject to revision, but one would still need to show, as with radical foundationalism, how to ground judgments about the physical world in the deliverances of introspection. Many of the justificatory projects faced by radical foundationalism will have analogues within this more modest foundationalist enterprise; the problems of the external world, of other minds, and of the past and the future, for example, will present the modest foundationalist with justificatory projects (see Foundationalism).

Coherence theorists - who hold, roughly, that a belief is justified if it fits in with one's other beliefs - may also accept the doctrine of the priority of self-knowledge. Indeed, on one natural way of presenting a coherence theory, agents who wish to justify their beliefs must begin by introspecting in order to discover what beliefs they have; only then can the project of justifying one's beliefs begin. In holding such an account of justification, one need not hold that introspection gives one complete or infallible access to one's beliefs. Introspection is used here, as in modest foundationalism, simply to provide a starting point for the task of justification. Having provided such a starting point, the deliverances of introspection may subsequently be revised in light of considerations of overall coherence (see Knowledge and justification, coherence theory of).

These versions of foundationalism and the coherence theory share a commitment to the doctrine of the epistemic priority of self-knowledge. On these versions of both views, knowledge of the physical world is possible only when appropriately founded in knowledge of (certain of) one's own mental states. Some have argued, however, that both foundationalism and the coherence theory thus understood are misguided for precisely this reason, for it may be thought that the doctrine of the epistemic priority of self-knowledge is also undermined once introspection is seen as a source of only an incomplete and partially accurate view of the mind. On such a view, the special epistemic status of self-knowledge depends upon the infallibility of introspection. If introspection is a source of knowledge which is both incomplete and fallible, then it fails to distinguish itself from perception of the external world as a privileged source of belief. Introspection may be, on the whole, a source of accurate information about the mind, but on this view it can occupy no special place in a theory of justification once the claim of infallibility is rejected. There is no more reason to begin the project of justifying one's beliefs with the deliverances of introspection than with the deliverances of sense perception. The reflective believer, on this view, does not begin reflection by focusing exclusively on the contents of their own mind, and then determining what can be justified in light of such contents; instead, perceptual judgments are taken at face value from the beginning, just as introspective judgments are, and the project of justification proceeds against the background of one's total body of belief. Such a view makes a complete break with Cartesian doctrine by assigning no special status whatsoever to introspection.

4 Introspection and the metaphysics of mind

Thus far, we have examined the significance of introspection for epistemology, but introspection has also been pressed into service to support important metaphysical doctrines. Descartes argues in the Sixth Meditation that we recognize our existence as thinking beings by way of introspection, and this provides the key premise in an argument for dualism (see Dualism). Once again, there is substantial scholarly debate on the precise nature of the argument, but this much is clear: Descartes points out that he can conceive that the world could be such that he should have no body and yet, at the same time, his introspective understanding should guarantee that he exists as a thinking thing. Thinking alone, he argues, is essential to him. From these premises, he concludes that the mind may exist without the body; it is an immaterial substance.

This argument was attacked from its first presentation. Descartes' critics contend that the mere fact that one can conceive of the mind existing without the body does not show that, in fact, it can exist without the body. I can imagine, for example, that my computer should continue to work even if its plug should be removed from the outlet, but this of course does not show that it is a genuine possibility that it should continue to work in such circumstances. My ability to conceive of my mind existing without my body may similarly reflect no genuine possibility. Although the argument is clearly defective when presented in just this way, it continues to remain a

source of interest in discussion of the mind and its nature, and many still argue that some version of this argument, or considerations in some way similar to those Descartes brought forth, may be used to defend dualism. Thus, a number of authors have recently argued that a complete physical description of the universe inevitably leaves something out which introspection reveals, namely the qualitative nature of mental states. There is something it is like to be a bat, for example, but any physical description of the bat's brain, central nervous system, sensory equipment and so on, inevitably leaves this out. This shows, it is argued, that a physical account of the bat is thus incomplete. Some have taken this to show that a proper account of the mind must inevitably appeal to something nonphysical. Once again, introspective evidence is called upon to support dualism. More than this, the argument assumes, with Descartes, that introspection provides us with some deep insight into the essential properties of our mental states, properties which are fundamentally incompatible with those of the physical realm.

5 Introspection and self-improvement

Just as introspection has long been thought to provide a special route and a special insight into the self, it has also been thought to provide an indispensable tool in projects of self-improvement, both epistemological and moral. On the epistemological side, the special connection thought by Cartesians to hold between introspective access to one's mental states and the justification of one's beliefs dictates that those who wish to improve their epistemic situation must allow introspection to play a central role in that project. By the same token, many have thought that the first step on the road to moral self-improvement involves introspective self-scrutiny, examining one's motivations and character traits. Indeed, it has frequently been held that introspective self-monitoring is a crucial constituent of a moral life. One might reasonably wonder, however, given the possibility of self-deception, whether introspection is really the best tool for carrying out such a project of moral self-evaluation. It has even been argued, on empirical grounds, that introspection is not well suited to the task of epistemic self-evaluation because introspection may be especially insensitive in locating and identifying beliefs held on inadequate grounds. Even the most radical anti-Cartesians, however, grant that introspection must play some role in these projects. While it can no longer be claimed that introspection presents the final word on the character of one's mind, there can be no doubt that it plays an important role in the project of self-understanding.

Introspection, psychology of

Introspection is the process of directly examining one's own conscious mental states and processes. Since the seventeenth century, there has been considerable disagreement on the scope, nature and epistemic status of introspection. Descartes held that all our mental states are subject to introspection; that it is sufficient to have a mental state to be aware of it; and that when we introspect, we cannot be mistaken about what we 'see'. Each of these views has been disputed. Nineteenth-century psychology relied heavily on introspection, but with the exception of important work in psychophysics and perception, it is now primarily of historical interest. Recently, Nisbett and Wilson have argued that when people attempt to report on the processes mediating the effects of a stimulus on a response, they do not do so on the basis of introspection but, rather, on the basis of an implicit common-sense 'theory'. Ericsson and Simon have developed a model of the mechanisms by which 'introspective' reports are generated and have used that model to identify the conditions under which such reports are reliable.

1 The classical conception

The term 'introspection' comes from the Latin 'spicere' (to look) and 'intra' (within). In ordinary English, it means 'the observation of one's own mental states or processes'. As we shall see in §3, whether introspection truly constitutes a form of observation is a matter of dispute. However, it is generally agreed that introspection involves awareness of certain aspects of one's mind, specifically, an awareness that involves a 'higher-order' belief or representation that one is in some 'lower-order' mental state. (A thought about cats is a 'first-order' mental state, whereas a belief *that one has a thought about cats* is 'second-order'.)

The first important treatment of introspection is that of Descartes (1641), who held that there is nothing to the mind but what is in consciousness and available to introspection (see Consciousness §7; Introspection, epistemology of). Introspective awareness of our mental states and processes might be thought to be the result of a separate higher-order process trained on lower-order states and processes. However, for Descartes, the connection is much closer than that: mental states and processes are, on his view, 'self-intimating'. It is sufficient simply for a mental state or process to be 'within us' for us to be aware of it. Indeed, Descartes held that the beliefs that result from introspection are infallible. As long as we consider our mental states only as they are 'in themselves', they cannot be false.

2 The scope of introspection

Does the set of states and processes that can be introspected exhaust the mental? Philosophical responses to this question fall into two traditions. Until well into the nineteenth century, most Anglo-American philosophers, including, in particular, the British Empiricists (Locke, J.,Hume, D., Mill, J.) and the American, William James, followed Descartes in answering in the affirmative (see Empiricism; Sense-data). In contrast, many German philosophers, beginning with Leibniz and including Kant and Schopenhauer, have argued that there are aspects of mind that are hidden from introspective awareness.

The current view is largely anti-Cartesian. Both Freudian psychoanalytic theories and contemporary cognitive science posit the existence of unconscious mental states and processes, that is, mental states and processes to which introspection has no access (see Unconscious mental states). A popular view among psychologists, in fact, is that introspective accessibility is not simply a black and white affair but, rather, that there are multiple levels of consciousness, each with its own conditions of accessibility.

3 The nature of introspection

There is substantial disagreement about the role of introspection and the kind of process introspection might be. Many disagree, for example, about whether one can be in a conscious mental state without being introspectively aware that one is in that state. The received view (see, for example, Armstrong 1968; Rosenthal 1986; Dretske 1993) is that one can; Shoemaker (1994) has argued to the contrary.

Second, there is disagreement over what 'order' of belief or representation is required for introspective awareness. Most philosophers who adopt the 'higher-order thought' view opt for a second-order thought as sufficient.

Rosenthal, however, suggests that second-order thoughts are simply what makes a state conscious; introspective awareness requires that we be conscious of those second-order thoughts and, hence, that there be a *third*-order thought that one is having the second-order ones.

Finally, there is considerable discussion over whether introspection is correctly considered to be a form of perception or observation, a view associated with Locke (1689). For example, in perception, there is both object-awareness and fact-awareness. I perceive the tree and perceive that there is a tree. Are there also two forms of awareness in introspection? Do I both perceive my pain and perceive that I am in pain? Shoemaker and Dretske argue that introspection does not involve awareness of any (mental) object such as a ‘pain’. Furthermore, in perception, the relation between the objects perceived and the state of perceiving is causal. Is the same thing true for introspection, or is the relation also conceptual, as Shoemaker has argued? In other words, are there mental states whose introspectibility is essential to their very nature? This would be the case if one adopts Descartes’ view that mental states are self-intimating or Shoemaker’s view that mental states are defined by their functional role, and this role includes producing introspective awareness of the states in question (see Consciousness §10).

4 Epistemic status and scientific role

Many philosophers have taken issue with the Cartesian view that introspection is infallible. For example, James held that because introspection involves conceptualization, it suffers from fallibility just as any mode of observation does. Armstrong agrees that introspective awareness is fallible, but for a different reason, namely, that the state being introspected and the introspecting state are ‘distinct existences’, and, hence, connected only contingently.

Psychologists have focused not so much on the epistemic status of introspective awareness *per se* but on whether introspection can constitute a reliable method for the scientific study of the human mind. There were considerable efforts in the nineteenth century to found psychology on careful introspective reports, and the work of Weber, Fechner and Helmholtz gave rise to important work on the ‘psychophysics’ of sensation (or the relation of introspected to physical magnitudes of, for example, light and sound) that continues to the present day (see Stevens 1951; Sekuler and Blake 1994). In contrast, the ‘structuralist’ programme of Wundt and Titchener, which sought to discover the basic elements of thought and the laws by which they combine into more complex mental experiences, was far less successful.

In the early nineteenth century, Comte (1830) issued two challenges to a general introspective psychology. First, he asserted that introspection of intellectual (as opposed to emotive) activity is impossible. The conscious self is, in some sense, essentially unified. Hence, it cannot ‘split’ itself into two, one portion engaged in first-order intellectual activity with a second portion looking on. Second, even supposing that introspection is possible, it is worthless, presumably, because it is unreliable (see Consciousness §6).

Psychologists and philosophers interested in scientific psychology have responded to these challenges in a variety of ways. For example, James (1890) agreed with Comte that introspective awareness of ‘on-line’ intellectual activity is impossible. However, since we clearly are often aware of what passes in our minds, we must ask how this can be. His view, following Mill (1865), was that introspection is actually retrospection. We are not aware of our occurrent states as we have them but, rather, of our *immediate memories* of those states. Since these memories are not part of the stream of consciousness, the impossible split in the conscious self is avoided (see Consciousness §10).

Comte’s second challenge is, perhaps, the more serious of the two. For it might well be the case that although introspection is possible, the process of introspecting distorts the first-order mental activity being introspected. The threat of such distortion was a serious problem for the introspectionist psychologists of the late nineteenth and early twentieth century. In fact, some have argued that Titchener’s failure to take the problem of unreliability sufficiently to heart contributed not only to the downfall of introspectionist psychology in particular, but also to the radical behaviourist ‘revolution’ and the eclipse of any mentalistic psychology for much of the twentieth century (see Behaviourism, methodological and scientific).

Behaviourism has itself now been overthrown in favour of an approach that, once again, takes the mental seriously. As a consequence, psychologists are struggling with the question of whether and to what extent introspective awareness can give us information about our mental states and processes. A contemporary challenge

to the reliability of introspection comes from the work of Nisbett and Wilson (1977) who considered the psychological causes of our judgments and behaviour. They argued that people have little or no privileged introspective access to such causal information. Instead, their reports are based on implicit, cultural 'theories' that they apply to themselves as they do to others.

In one classic study cited by Nisbett and Wilson, subjects were asked to tie together the ends of two cords hung from the ceiling that were placed far enough apart so that one cord could not be reached while holding on to the other. To solve the problem, subjects were permitted to use any of the various objects strewn about the room. There were several solutions, one of which involved attaching a weight to the end of one cord, and then swinging it so that it could be caught while holding on to the second cord. Most subjects could not discover this solution on their own. However, when cued by the experimenter casually putting one of the cords in motion in the periphery of the subjects' vision, they typically solved the problem within 45 seconds. Subsequently, though, when subjects were asked how they arrived at this solution, the experimenter's hint was mentioned by less than a third of the subjects.

The most powerful defence of introspection in recent years comes from two cognitive scientists, Ericsson and Simon (1980). They argued that verbal reports of mental activities constitute important data, but that we can only assess the epistemic value of this data if we understand the mechanisms by which the reports are generated. They then proposed a model according to which cognitive information can be stored in various memories, including short-term memory (STM), which has a limited capacity and a short duration, and long-term memory (LTM), which has a very large capacity and is relatively permanent. Information that is attended to is kept in STM and is directly accessible for verbal report. Information stored in LTM must be retrieved before it can be reported (see Memory).

There are many different kinds of verbal report. First, we can distinguish reports that are concurrent with the execution of the primary task (such as solving a problem in mathematics) from reports that are retrospective. Second, some verbal reports ('level I') require no additional processing. This is so when information used in the primary task is already in verbal form (in STM) and simply requires articulation. In contrast, there are verbal reports that do require additional processing, either recoding, say, from visual to verbal form ('level II'), or filtering and providing information (such as the reasons for certain behaviour or choices) to which attention would not ordinarily be paid ('level III').

The Ericsson and Simon model predicts what a host of experimental studies have borne out; that each of these different types of verbal report will differ in accuracy. In particular, concurrent level I reports neither change nor slow the course or structure of the primary-task cognitive process. Concurrent level II reports may slow the primary-task cognitive processes, but also do not change them. However, for level III reports, there may well be substantial effects on task performance. Finally, the accuracy of retrospective reports depends not only on the level involved but also on the duration of the task and the lag between completion and the report. As both the duration and lag time increases, accuracy will decrease.

Ericsson and Simon claim that their model is quite consistent with Nisbett and Wilson's findings. In particular, in the studies reviewed by Nisbett and Wilson, the retrospective procedures used to elicit the actors' reports were not those the model identifies as eliciting valid reports. For example, in the cord-tying task, subjects do not report the causal role of the hint because by the time they are queried, this information is no longer in short-term memory.

Intuitionism

Ultimately, mathematical intuitionism gets its name and its epistemological parentage from a conviction of Kant: that intuition reveals basic mathematical principles as true a priori. Intuitionism's mathematical lineage is that of radical constructivism: constructive in requiring proofs of existential claims to yield provable instances of those claims; radical in seeking a wholesale reconstruction of mathematics. Although partly inspired by Kronecker and Poincaré, twentieth-century intuitionism is dominated by the 'neo-intuitionism' of the Dutch mathematician L.E.J. Brouwer. Brouwer's reworking of analysis, paradigmatic for intuitionism, broke the bounds on traditional constructivism by embracing real numbers given by free choice sequences. Brouwer's theorem - that every real-valued function on a closed, bounded interval is uniformly continuous - brings intuitionism into seeming conflict with results of conventional mathematics.

Despite Brouwer's distaste for logic, formal systems for intuitionism were devised and developments in intuitionistic mathematics began to parallel those in metamathematics. A. Heyting was the first to formalize both intuitionistic logic and arithmetic and to interpret the logic over types of abstract proofs. Tarski, Beth and Kripke each constructed a distinctive class of models for intuitionistic logic. Gödel, in his Dialectica *interpretation, showed how to view formal intuitionistic arithmetic as a calculus of higher-order functions. S.C. Kleene gave a 'realizability' interpretation to the same theory using codes of recursive functions. In the last decades of the twentieth century, applications of intuitionistic higher-order logic and type theory to category theory and computer science have made these systems objects of intense study. At the same time, philosophers and logicians, under the influence of M. Dummett, have sought to enlist intuitionism under the banner of general antirealist semantics for natural languages.*

1 Kantian epistemology, constructivism and 'semi-intuitionism'

The thesis from which mathematical intuitionism draws its name is Kant's: that we exercise a pure intuition to apprehend the correctness of basic mathematical claims directly and a priori. Kant defended the thesis - for arithmetic and geometry - in the 'Transcendental Aesthetic' of his first *Critique*. Twentieth-century intuitionists, under the leadership of L.E.J. Brouwer, founder of Dutch or neo-intuitionism, adopted a modification of Kant's view. Intuition in elementary arithmetic and analysis was to be identified with a pure intuition of the subdivision of time intervals. Kant's account of geometry was refused and only elementary arithmetic retained intuitive primacy (see Mathematics, foundations of). By Brouwer's lights, the role of intuition cannot be understudied by empirical inquiry, linguistic understanding or logical reasoning. Brouwer's intuitionism, then, opposes both empiricism and logicism. Moreover, since intuitionists think to know intuitively principles which are infinitary and contentful, intuitionism is also at odds with finitism and formalism.

Deprecation of logic's influence on mathematics has been characteristic of intuitionism and is reminiscent of the attitudes Schopenhauer expressed in *Die Welt als Wille und Vorstellung (The World as Will and Representation)*. According to Schopenhauer, mathematics is not best developed *more geometrico*, since deductions from axioms obscure the true grounds for mathematical results. He argued that each mathematical truth *S* has its own intuitable ground of being *G* and that the premier means to intuit the truth of *S* would be to uncover *G* and construct it in time without the aid of explicit deduction. Schopenhauer recommended that mathematics be reformulated accordingly.

Since before the time of Brouwer, intuitionistic mathematics has been constructive. In general, the demand for constructivism is the demand that E be respected:

(E) The correctness of existential claim $\exists x A(x)$ is to be guaranteed by warrants from which both an object *a* and a further warrant for $A(a)$ are constructible.

Constructivism is commonly deemed revisionary of conventional mathematics, requiring alteration in standard notions of mathematical objects, canons of adequate proof and fundamental principles of reasoning (see Constructivism in mathematics). Intuitionists trace their constructive lineage at least as far back as Leopold Kronecker (1823-91), who initiated a programme for arithmetizing higher algebra; in this, he demanded for arithmetic a primacy irreducible to natural science or logic and refused to countenance non-constructive existence proofs.

Writings of the so-called ‘semi-intuitionists’, particularly Poincaré and Borel, exerted a strong influence on Brouwer and his followers. Poincaré, considered the leading European mathematician of his day, also rejected the idea that geometric truths express synthetic judgments known a priori but embraced the intuitive aprioricity of elementary arithmetic, with mathematical induction holding pride of place (see Poincaré, J.H. §§3, 5). In common with the Dutch intuitionists, Poincaré construed infinite totalities as potential, rather than completed. Accordingly, he rejected, along with Russell’s type theory, Zermelo’s axioms for set theory as guarantors of transfinite arithmetic. Borel was a prominent member of the ‘Paris school’ of mathematicians, which included Baire and Lebesgue. He advocated constructivism to the extent that existence was to be tied to explicit definability: specific functions and real numbers were only to be accepted once they were fully defined. Borel distinguished, as did the young Brouwer, a ‘geometric’ from a ‘practical’ continuum. The former was deemed the object of a general intuition, not analysable into individual reals. The latter was the totality of definable real numbers. It was probably in writings by Borel (or an earlier book by Du Bois Reymond) that Brouwer came upon the idea that real numbers be given by choice sequences of rationals generated randomly, as if by successive throws of a die.

2 Brouwer and Dutch intuitionism

The intuitionism of the twentieth century is that of Brouwer: a radical extension of constructive mathematics incorporating anti-classical principles of logic and analysis. Brouwer held the chair in set theory and axiomatics at the University of Amsterdam from 1912 until 1955. He first achieved fame for discoveries in algebraic topology, particularly proofs of the invariance of dimension and of the fixed-point theorem that bears his name. In articles published between 1907 and 1930, Brouwer combined a battery of influences with an austere personal philosophy of life to create a programme for intuitionistic mathematics. The programme called for trenchant criticism of presuppositions of conventional mathematics as well as thorough reconstruction of arithmetic, analysis and set theory so as to free them of those presuppositions.

In accordance with his subjectivistic, even solipsistic, personal philosophy, Brouwer insisted that intuitionistic mathematics be a private study of mental mathematical constructions. Language and interpersonal communication, indeed all intellectual activity, played diminished roles in Brouwer’s scheme of things. He thought language an instrument so defective as to make mathematicians incapable of conveying the precise sense of their constructions to others. Hence, if mathematics is to retain certainty and exactness, it was not to consist in linguistic representations but in languageless construction. Brouwerian mathematics would not be able to derive its authority from the application to mathematics of a universal logic, valid for all domains of thought.

After Brouwer, the principal exponent of Dutch intuitionism was his student and colleague, Heyting. In addition to major contributions to the formalization of intuitionistic logic, arithmetic and set theory and to the interpretation of that formalism, Heyting pursued studies in intuitionistic algebra, geometry and the theory of Hilbert space. Among early intuitionists were M.J. Belinfante, G.F.C. Griss, H. Freudenthal, B. van Rootselaar and, for a time, H. Weyl. The most distinguished proponents of Dutch intuitionism during the last quarter of the twentieth century are students of Heyting: A.S. Troelstra and D. van Dalen. Notable as well has been a group of intuitionists from Nijmegen including H. de Swart and W. Veldman.

3 Elements of Brouwerian intuitionism

Already in his 1907 dissertation, ‘On the Foundations of Mathematics’, Brouwer was advancing the intuitionistic idea that mathematics is a ‘free creation’ of the mind unfettered by empirical data or linguistic constraints. Beginning with ‘The Unreliability of the Logical Principles’ (1908 [1975]), Brouwer took critical aim at the ground rules of conventional mathematics, challenging the validity of the law of the excluded middle (LEM). (The 1908 article may also reflect views held by Brouwer’s teacher and colleague G. Mannoury.)

The validity of LEM does conflict with a natural view of constructivity. At present, it is unknown whether there exist an infinite number of twin primes, that is, pairs of prime numbers that differ by 2. Let the predicate $P(x)$ hold of *p* just in case $\langle p, p+2\rangle$ is the greatest twin prime pair, if such a pair exists, or of 1, if there are an infinite number of twin primes. If LEM is valid, there exists a determinate *m* such that $P(m)$. However, short of solving the problem of twin primes, no one can provide, in accordance with E, a recipe for computing *m* in decimal notation. It is noteworthy, first, that Brouwer did not think that this style of reasoning proved the negation of LEM. Rather, he maintained that it affords LEM a ‘weak counterexample’, a proof that the intuitionist will, most likely,

never be able to endorse that law. (Quantified versions of LEM are refuted by intuitionistic continuity principles, described below.) Second, a direct mathematical connection is here forged between the truth of disjunctions and the availability of recipes for deciding an issue.

Brouwer also constructed weak counterexamples to such conventional theorems as that every real is either rational or irrational and that the continuum is totally ordered. In the case of the former, generate in parallel the decimal expansions of π and of ρ, where ρ's expansion begins $0.33333\ldots$ but is to be halted when a string of seven 7s appears in the expansion of π. Clearly, ρ cannot be irrational, for then the desired string neither appears nor fails to appear. But, to assert that ρ is rational, E requires that one locate integers *m* and *n* such that ρ is their quotient. This is not possible, for we would then know where a string of seven 7s appears in the expansion of π, something now unknown.

Prior to 1920, Brouwer adopted the notion of 'choice sequences', also called 'infinitely proceeding' sequences. These need be neither law-like - governed by computable recipes for generating terms - nor even fully determinate in advance. Brouwer permitted restrictions imposed by a spread law (see below) but, beyond that, nothing about the future course of the sequence may be known, other than the fact that its terms are freely and independently chosen.

Brouwer employed two intuitionistic analogues for the conventional notion of a class of numbers. These are the concepts now called 'species' and 'spread'. Species are properties determined by extensional mathematical predicates and are themselves individuated extensionally: pairs of species are identical when they apply to the same items. Spreads are either species of choice sequences constrained to obey a spread law or species of sequences obtained from these via continuous mappings. A 'spread law' is a decidable property of finite sequences which holds of the empty sequence and culls out from the tree of all sequences a subtree containing branches unbounded in length. A choice sequence is an 'element' of a spread *S* when it determines a branch in *S*'s tree. A spread with a tree which always branches finitely often was called by Brouwer a 'fan'.

These notions in hand, Brouwer proved the most celebrated result of intuitionistic mathematics, now known as 'Brouwer's theorem': every real-valued function of a real variable defined on a closed, bounded interval is uniformly continuous. This theorem is known to follow from two distinctively intuitionistic principles. The first, originally isolated by Heyting, is weak continuity (WC-N). Let 'α' and 'β' range over choice sequences and '*n*' over natural numbers. Neighbourhoods of α are determined by its initial segments *s*: β lies in the *s*-neighbourhood of α ($\beta \in s$) whenever it shares *s* with α.

(WC-N) If $\forall\alpha\exists nA(\alpha,n)$, then, $\forall\alpha\exists n\exists$ neighbourhood *s* of α $\forall\beta\in sA(\beta,n)$.

E and the indeterminacy of choice sequences are thought to secure plausibility for WC-N. When we have $\forall\alpha\exists nA(\alpha,n)$, there is to hand a uniform method *M* for constructing, from each choice sequence α, an *n* such that $A(\alpha,n)$. Since *M* is uniform, it can take cognizance, in calculating a specific *n* from α, of no more than an initial segment of α. After all, we may know nothing more of the course of α than the terms already calculated. Hence, *M* must yield a proof, for that *n*, of $\forall\beta\in sA(\beta,n)$. WC-N is alone sufficient to yield strong counterexamples to quantified forms of LEM. Contemporary proofs of Brouwer's theorem also rely on the 'fan theorem', an intuitionistic correlate of König's lemma, which asserts that, with respect to the neighbourhoods just described, every fan is constructively a compact topological space.

In such articles as 'Über Definitionsbereiche von Funktionen' (On Domains of Definitions for Functions, 1927 [1975]), Brouwer attempted a detailed proof of Brouwer's theorem and explained how to deduce the fan theorem from another assertion about spreads, the 'bar theorem'. The latter is, in effect, a principle of 'reverse induction' up from the bottom nodes in a countable, well-founded tree. Let *S* be a spread. A set of finite sequences *B* in *S* is a 'bar' when all α in *S* have initial segments in *B*. A set of finite sequences *A* in *S* is 'hereditary' if *A* holds of sequence *s* in *S* whenever it holds of all *s*'s descendants in *S*. The bar theorem asserts that, whenever *A* is hereditary and contains a decidable bar *B*, the empty sequence belongs to *A*. Unfortunately, Brouwer's attempt to prove it suffered from a non sequitur and is widely considered inconclusive.

Most controversial of Brouwer's innovations, even for fellow intuitionists, was his theory of the 'creative subject'. In articles published after 1947, Brouwer put to work, in defining choice sequences, a representation in temporal

series of the discoveries of an idealized mathematician. From this representation, Brouwer looked to derive strong counterexamples - direct refutations - for findings of conventional analysis, among them that every linear equation with non-zero coefficients has a real solution. Some see the creative subject as a child of Brouwer's subjectivistic philosophy because of Brouwer's assumption that any claim which is permanently unknown to the ideal mathematician is false. Due to difficulties attending its formal analysis, the creative subject remains a subject of debate.

4 Heyting's logic and the proof interpretation

To win a prize offered by the Dutch Mathematical Association, Heyting made the first efforts at a comprehensive formalization for Brouwerian logic, arithmetic and set theory. His system, published in 1930 and 1931, was anticipated in part by the incomplete systems of A.N. Kolmogorov and V.I. Glivenko. Notational details aside, Heyting's predicate logic, now treated as definitive of intuitionistic logic, is equivalent to Gentzen's later natural deduction system NJ. Standard formalizations of intuitionistic predicate logic and elementary arithmetic are still called 'Heyting predicate logic' - or HPL, for short - and 'Heyting arithmetic' - HA - in honour of his achievement.

In a monograph of 1934, Heyting advanced an interpretation of the logic which, he believed, expressed its Brouwerian meaning. He gave, by recursion on claims *A*, conditions on abstract intuitionistic proofs of *A*. The 'proof interpretations' for ' $\vee$', ' $\rightarrow$' and ' $\forall$' statements are, roughly, as follows.

($\vee$) A proof of $A \vee B$ consists in both a number and a further proof such that, if the number has value 0, the further proof is one of *A* and, if the number has value 1, the proof is of *B*.
($\rightarrow$) A proof of $A \rightarrow B$ affords a construction converting any proof of *A* into one of *B*.
($\forall$) A proof of $\forall n A(n)$ affords a construction *f* such that, for any number *m*, $f(m)$ proves $A(m)$.

If constructions are computable operations, logics sound for this interpretation may not validate LEM. Let $A(n)$ define an undecidable set of natural numbers. Then, $\forall n(A(n) \vee \neg A(n))$ plausibly lacks proof. Were there such a proof - one satisfying ($\rightarrow$) and ($\forall$) - it would yield, computably in *n*, an $f(n)$ correctly marking the truth or falsity of $A(n)$, thus contradicting $A(n)$'s undecidability.

The idea of testing logical principles with abstract constructions and proofs is visible in Brouwer's writings. In 1932, Kolmogorov had offered, independently of Heyting, a structurally similar interpretation of intuitionistic reasoning as a 'calculus of problems'. Consequently, the proof interpretation is also known as the 'BHK interpretation', after Brouwer, Heyting and Kolmogorov. The adequacy of certain aspects of the BHK has been a matter of academic dispute. For example, if condition ($\rightarrow$) defines the concept 'abstract proof of $A \rightarrow B$', then the definition is impredicative: it contains a quantification - 'any proof of A' - over all proofs (see Constructivism in mathematics).

5 Metamathematics: intuitionistic systems and translation theorems

In the first decades after 1945, S.C. Kleene and G. Kreisel, together with their students and colleagues, led a host of metamathematical explorers into traditional intuitionistic territory. Kleene's system for Brouwer's analysis, 'FIM' after Kleene's book with R.E. Vesley, *The Foundations of Intuitionistic Mathematics* (1965), brought to it standard formalization. Among Kreisel's innumerable contributions are formal systems for choice sequences, higher-order arithmetic and the theory of constructions. Of special interest to post-war proof theorists was the system T invented by Gödel to express, for his *Dialectica* interpretation, the behaviours of primitive recursive functionals of finite type (see §6 below).

The 1970s brought out a bumper crop of intuitionistic formal theories for sets, types and higher-order functions. Troelstra (1973a) subjected HAS, a second-order version of Heyting arithmetic containing variables for species and an impredicative comprehension axiom, to logical examination. For computer scientists (see §7), Martin-Löf's unconventional ML type theories acquired a certain celebrity. The ML systems were not invented, as was FIM, to formalize Brouwer's analysis but to represent a mixture of traditional ideas with Martin-Löf's own approach to constructivism. Among the ideas ML assimilates are the BHK interpretation and Frege's distinction between thought and assertion as well as such proof-theoretic mainstays as normalization and W. Howard's 'formulas-as-types'.

As for set theories, IZF - 'intuitionistic Zermelo-Fraenkel' - was a formalism of choice for studying universes of Heyting-valued sets (see §6). H. Friedman's system B was intended to formalize E. Bishop's constructive analysis but is no stronger, proof-theoretically, than HA. P. Aczel's 'constructive Zermelo-Fraenkel' CZF is translatable into an ML system with a type for well-founded trees. CZF is close kin to J. Myhill's constructive set theory CST.

In 1933, Gödel - and, independently, Gentzen and Bernays - showed how to embed the theorems of conventional Peano arithmetic (PA) faithfully into the negative ($\vee, \exists$-free) fragment of HA. So, PA is seen to be conservative over HA for negative formulas and, as far as consistency goes, HA is commensurate with its classical cousin. Unknown to Gödel and Gentzen, Kolmogorov had already proposed, in 1925, a similar negative translation for a fragment of HPL. More recently, negative translations have been discovered for higher-order arithmetic, type theory and set theory. Gödel also constructed (in 1933) a translation from Heyting's propositional logic into the modal calculus S4. H. Rasiowa and R. Sikorski later applied Gödel's idea to quantified systems. During the 1980s, modal interpretations for intuitionistic arithmetic motivated N. Goodman and S. Shapiro to recommend systems for 'intensional mathematics'.

6 Metamathematics: algebraic, functional and realizability interpretations

Just as conventional logical signs represent Boolean operations, the logical signs in HPL can also be read algebraically. The relevant algebraic operations act on the open sets of a topological space or, more generally, on elements of Heyting algebras - kinds of distributive lattices with greatest element T. So construed, every formula of HPL gets assigned a topological or lattice-theoretic 'truth-value' such that HPL-theorems always evaluate to T. In 1936, S. Jaśkowski seems to have been the first to interpret Heyting's propositional logic over finite distributive lattices. In the next two years, M. Stone and A. Tarski independently interpreted the logic over topological spaces. Tarski's article (1938) includes a proof, in conventional metalogic, that every propositional formula which is not an intuitionistic theorem has a countermodel over the open subsets of $\mathbb{R}$. A. Mostowski gave topological semantics to HPL. D.S. Scott (1968) showed how to extend topological interpretations to intuitionistic analysis, thereby constructing models for Brouwer's theorem. In the 1970s, Scott was among the prime movers in the study of Heyting-valued algebraic semantics for intuitionistic higher-order logic and set theory.

Close relatives of topological models (and of Cohen forcing) are Beth and Kripke models. In 1947, E.W. Beth introduced the idea of interpreting HPL over domains attached to nodes in finitely branching trees. He later argued that Heyting's logic is sound and complete with respect to his notion of model and that this fact is provable intuitionistically. (In the latter, Beth was shown to have erred.) S. Kripke (1965) proposed, in effect, that formulas be assigned upward closed subsets of partially ordered sets as 'truth-values'. He gave conventional proofs that HPL is sound and complete with respect to these assignments and that validity in Kripke structures and in Beth structures are equivalent. Both types of models have been extended to other intuitionistic systems, including set theory. Later researchers saw that sets of Kripke or of Beth models can be 'glued' together to prove that HA, not to mention other systems, possesses the disjunction property (DP) and explicit definability for numbers (EDN). A system *S* has DP just in case, whenever *A* and *B* are sentences and *S* derives $A \vee B$, then *S* derives *A* or *S* derives *B*. *S* has EDN if, whenever $\exists n A(n)$ is a sentence that *S* derives, there is a number term *t* such that *S* derives $A(t)$.

The premier functional interpretation for HA was Gödel's 1959 *Dialectica*, named for the journal in which it first appeared. The point of the interpretation, conceived by Gödel as early as 1941, was to obtain a consistency proof for arithmetic via an extension of Hilbertian finitistic reasoning to higher types. Here, each arithmetic formula is replaced by a quantifier-free translation in the formal system T. The logic of HA is thereby subsumed within combinatorics for higher-type objects. Gödel maintained that the correctness of T is sufficiently evident that the interpretation gives a convincing proof for HA's consistency. Extensions and applications of Gödel's ideas were soon forthcoming: in the late 1950s and early 1960s, Kreisel and C. Spector constructed *Dialectica*-style interpretations for analysis; J.-Y. Girard found functional interpretations for HAS in 1971.

Generally, a 'realizability interpretation' is an association between formulas *A* and items *i* such that *i* serves, intuitively, to encode information available from a constructive proof of *A*. When *i* is so associated with *A*, it is said to 'realize' *A* or to be a realizability witness for *A*. On Kleene's original realizability interpretation from 1945, witnesses are natural numbers that encode the computational information given by *A*. Witnesses of conditionals, for example, are Turing machine indices such that, if $[[A]]$ and $[[B]]$ are the sets of witnesses for *A* and *B*,

respectively, then $[[A \rightarrow B]]$ is the set of all indices of machines which, given inputs from $[[A]]$, output in $[[B]]$. Kleene proved each HA-theorem to have a non-empty set of witnesses. Realizability also shows HA to be consistent with Church's thesis, the assertion that every arithmetical function is Turing computable. Kleene later devised a realizability interpretation for FIM in which witnesses are functions rather than numbers. He also enlarged the idea of realizability to incorporate his *q*-realizability and 'slash' interpretations; these permit straightforward proofs of DP and EDN for HA. Many forms of realizability have been invented, extending the concept to most intuitionistic systems.

7 Category theory and computer science

In the 1970s and 1980s, applications of formal systems to category theory and to computer science stimulated new interest in intuitionism. During 1969, F.W. Lawvere isolated axioms for categories which are elementary topoi - generalizations of Grothendieck topoi. Together with M. Tierney, he verified that topoi represent categorial versions of set-theoretic universes which are intuitionistic, rather than conventional, in their logic. The set of truth-values within a topos is always a Heyting, rather than a Boolean, algebra. Research has shown that the theory of interpretations over categories encompasses not only algebraic and topological models but also Kripke models, Beth models and realizability. (See Category theory, applications to the foundations of mathematics.)

Computer scientists have put formal constructive proofs to work extracting programs. As E would have it, a proof *p* of *A* is constructive to the extent that there are methods *M* for extracting from *p* computational information relevant to *A*. For instance, if *p* is a constructive proof of $\forall n \exists m A(n, m)$, *M* should extract from *p* a recipe guaranteed to compute a function *f* such that, for all *n*, $A(n, f(n))$. The power of high-level programming languages makes it possible to ask for software to play the role of methods *M*: to extract automatically, from formal proofs *p*, programs guaranteed to compute functions with the behaviours *p* specifies. Such software would convert a formal constructive proof that a specification is satisfiable into a program certain to satisfy it. During the 1980s, a number of researchers looked to implement constructive program extraction, among them R.L. Constable and his associates at Cornell (1986), creators of the PRL ('proof refinement logic') systems inspired by Martin-Löf's ML.

8 Intuitionism and antirealism

Since the 1970s, Michael Dummett has been principal sponsor for the view that foundational issues for intuitionism and its logic are properly addressed in philosophical discussions over programmatic 'antirealist' semantics for natural language. Dummett proposed that debates between proponents of conventional and of intuitionistic logics gain a solid footing only when viewed as one skirmish within a wider battle between proponents of realist and of antirealist semantics. Dummett's semantic realist insists that the meaning of statements be explicated by theories associating each statement with bivalent truth-conditions which obtain or fail independently of human knowledge. Dummett's conjectured antirealist would have it that the meanings of statements can only be given in terms of operations people have been taught to employ in verifying or falsifying claims, and not in terms of truth-conditions which may prove ineffable. Intuitionism, then, is supposed to represent an expression of antirealism for which the relevant semantic operations would be those entering into the fashioning of intuitionistic proofs. (See Antirealism in the philosophy of mathematics §2.)

Obstacles to the antirealist programme include the difficulties inherent in designing, even in outline, a coherent antirealist semantics that covers all the territory Dummett has suggested it might cover, including antirealism about psychology and the past. Also, it is in no way clear that features of intuitionistic logic and mathematics can be well understood from the vantage of a semantic theory. It remains to be shown that intuitionistic mathematics, rather than finitism or Markovian constructivism, is the true ally of antirealist semantics. Lastly, it is a concern that Dummett's ideas flout one of the main planks of Brouwer's intuitionism: that mathematics must be independent of metaphysics. For traditional intuitionists, there can be no final explanation for intuitionistic mathematics other than the mathematics itself.

Intuitionism in ethics

To intuit something is to apprehend it directly, without recourse to reasoning processes such as deduction or induction. Intuitionism in ethics proposes that we have a capacity for intuition and that some of the facts or properties that we intuit are irreducibly ethical. Traditionally, intuitionism also advances the important thesis that beliefs arising from intuition have direct justification, and therefore do not need to be justified by appeal to other beliefs or facts. So, while intuitionism in ethics is about the apprehension of ethical facts or properties, traditional intuitionism is principally a view about how beliefs, including ethical beliefs are justified. Varieties of intuitionism differ over what is intuited (for example, rightness or goodness?); whether what is intuited is general and abstract or concrete and particular; the degree of justification offered by intuition; and the nature of the intuitive capacity. The rejection of intuitionism is usually a result of rejecting one of the views that lie behind it.

Note that 'intuition' can refer to the thing intuited as well as the process of intuiting. Also, somewhat confusingly, intuitionism is sometimes identified with pluralism, the view that there is a plurality of fundamental ethical properties or principles. This identification probably occurs because pluralists often accept the epistemological version of intuitionism.

1 The motivation for intuitionism

Traditional intuitionism in ethics is not so much an attempt to establish that we have justification for ethical beliefs as an attempt to explain how ethical beliefs get their justification. That some ethical beliefs have justification is taken as a datum to be explained.

The form this explanation takes is determined by an explicit or implicit commitment to three views: moral realism, the autonomy of ethics and foundationalism in the theory of knowledge. Moral realism is the view that there are ethical facts or properties that are in some way objective or mind-independent, although the exact nature of the objectivity or mind-independence is controversial (see Moral realism). That ethics is autonomous means that ethical facts cannot be 'reduced' to, or fully explained in terms of, nonethical ones (see Autonomy, ethical §5). For example, this would preclude something's goodness being analysable in terms of someone's desire for it. Foundationalism is a general theory about the justification of beliefs, asserting that all justification has as a foundation beliefs that have direct justification (see Foundationalism). Nonfoundational beliefs must rely for their ultimate justification on beliefs that have direct justification.

If it is accepted that we sometimes have justification for ethical beliefs and the explanation of their justification has to be consistent with these three views, then traditional intuitionism is almost inevitably the result. It should be noted, however, that some modern philosophers, such as Jonathan Dancy (1983), hold that some ethical facts or properties must be apprehended (intuited) directly, but reject foundationalism and the view that beliefs arising from intuition have direct justification. In what follows I shall focus on traditional intuitionism.

Moral realism, the autonomy of ethics, and foundationalism lead to traditional intuitionism as follows. The combination of moral realism and the autonomy of ethics ensures that ethical beliefs are about irreducibly ethical facts or properties and, thus, that ethical beliefs are irreducibly ethical. According to foundationalism, justification of beliefs about these irreducibly ethical facts or properties has as a foundation beliefs that have direct justification (that is, they are self-evident or need no evidence). Irreducibly ethical beliefs cannot have nonethical beliefs as their foundation. For if they could, the contents of the ethical beliefs would have to be so intimately related to the contents of the foundational nonethical beliefs as to be inconsistent with the autonomy of ethics. For example, if beliefs about desires provide the foundation for beliefs about goodness, then desiring and goodness would have to be intimately related. So, for any ethical beliefs to have justification, there must be some ethical beliefs that have direct justification and arise from direct apprehension (intuition). (If the foundational beliefs could arise from indirect apprehension, they could also be justified indirectly.)

Adding the 'datum' that we do sometimes have justification for ethical beliefs, we can conclude that some of our ethical beliefs arise from intuition and have direct justification. This is traditional intuitionism in ethics.

2 Varieties of intuitionism

Although elements of intuitionism have always had a place in ethical debate, it was only in the seventeenth century that it became a distinctive view (see Cambridge Platonism). More accurately, it became the distinctive core of a group of views, which has been developed in different ways.

For a start, in developing this core, we can ask what intuitions are about. For example, are they about rightness and wrongness, as according to H.A. Prichard (1949) and Joseph Butler (§3), goodness and badness, as held by G.E. Moore (1903), or defeasible moral reasons for performing and not performing actions, as W.D. Ross argued (1930; 1939) (see Prichard, H.A. §2; Moore, G.E.; Ross, W.D.)? Is what we intuit general and abstract, as Richard Price (§2) and Henry Sidgwick (§2) maintained, or concrete and particular (Prichard and Butler)? For example, if intuitions are about the rightness of actions, would we intuit that it is morally right to perform any action of a certain general type or would we intuit that a particular act we are contemplating is morally right?

Since justification comes in degrees, there can be divergent views about the degree of justification conferred on beliefs arising from intuition (see Moral knowledge §3). Although intuition has usually been taken to confer justification at least sufficient for knowledge, it could be held to confer any degree of justification from certainty (which guarantees truth) to a mere presumption in favour of the fact intuited. If complete justification is not conferred on a belief by intuition, then, of course, it may acquire additional justification on other grounds, such as the degree to which it coheres with other beliefs. Also, intuitionists can take different sides on the externalism/internalism question about justification (see Internalism and externalism in epistemology). Typically, internalists say that there has to be an awareness of the features that give a belief justification, while externalists deny this. Intuitionists who are internalists might say, for example, that a belief arising from intuition has justification only if the believer holds it to be indubitable (impossible not to believe) or, alternatively, merely difficult not to believe. On the other hand, externalists deny that such psychological features are required for the justification of beliefs arising from intuition.

There are also differing views about the nature of the intuitive capacity. It can be taken to be an intellectual capacity, as it was by Price and Moore, or a capacity for something more like perception, as it was by Prichard and Thomas Reid. Those who take the intuitive capacity to be intellectual usually hold that the contents of the intuitions are general or abstract principles. Those who take it to be more like perception usually believe that intuitions have particular, concrete contents.

It could be held that we have the capacity for both kinds of intuition, intellectual and perceptual, and each kind gives us foundational beliefs. It is more usual, however, to hold that we have the capacity for only one kind of intuition, that its contents (general or particular) are foundational and beliefs of the other kind are indirectly justified, if at all.

If we have the capacity only for intellectual intuition and we intuit general principles, then particular ethical beliefs might be justified by recognizing that some situation involves an instance of the general principle. For instance, if we intuit a general principle like ‘There is some ethical reason not to do any act that results in harm to anyone’, we might recognize that a particular act falls under the principle and conclude that we have an ethical reason not to do it. Alternatively, if the capacity is taken to be perceptual and the intuitions to be about particular situations, then the general principles may be justified by some kind of induction on the particular cases. For example, we might intuit something like ‘The harm this action would cause gives me an ethical reason not to do it’ and use some form of induction to arrive at the general principle.

In any case, it is important to distinguish between the order of justification and the order of discovery. It could be that general principles are discovered through consideration of particular cases, but are justified directly, while the particular beliefs are justified only indirectly, as instances of the general principle or content. For example, we may have to experience a number of instances of lying before we can intuit the general principle that lying is, *ceteris paribus*, wrong, while we are justified in believing that a particular instance of lying is, *ceteris paribus*, wrong, only by applying the general principle.

Finally, the capacity for ethical intuition needs grounding in some mechanism. Those who believe that the intuitive capacity is intellectual and the contents of intuition general usually hold that these contents are necessary, synthetic truths, that there are other such truths, such as those of mathematics, and that the same capacity and mechanism is used in apprehending all such truths (Price and Ross). Some who hold that that intuition is particular

and similar to perception postulate a 'moral sense' (Reid and Prichard) (see Moral sense theories). In neither case is the mechanism well understood.

3 Why not intuitionism?

The rejection of intuitionism is usually a consequence of rejecting one or more of the views that motivate it: moral realism, the autonomy of ethics and, in the case of traditional intuitionism, foundationalism. Although each of these views is controversial, the combination of moral realism and the autonomy of ethics is the source of objections to any form of intuitionism in ethics.

Intuitionism, and its commitment to irreducibly ethical facts or properties that we can apprehend directly, is incompatible with a broadly scientific, or naturalistic, picture of the world and how we learn about it. According to this picture, irreducibly ethical facts or properties would have to be occult. They would not be the sort of things that we can have scientific theories about. Matters are only made worse by claiming that we have some faculty that allows us to apprehend directly these irreducibly ethical properties or facts, to say nothing of the claim that beliefs arising from this direct apprehension are justified directly. Since the properties or facts are occult, so too must be the faculty that allows our awareness of them. Since persons would have an occult faculty, we could not have a complete scientific theory about persons. Indeed, the fact that moral realism and the autonomy of ethics lead to the claim that we have a capacity for intuition does not provide support for intuitionism; rather, it gives us ample reason to believe that at least one of the views leading to it must be wrong. Or so goes the objection.

Those who reject intuitionism by rejecting the autonomy of ethics usually argue that ethical properties or facts are actually nonethical ones, whose apprehension is compatible with the scientific picture of the world (see Naturalism in ethics). For example, it might be argued that to say that something is morally required is to say that it brings about more pleasure than its alternatives. Note that such views involve moral realism and may involve foundationalism.

Rejecting intuitionism by rejecting moral realism is consistent with accepting the autonomy of ethics. For example, it could be held that what seem to be ethical judgments are actually irreducibly ethical prescriptions, the expression of irreducibly ethical attitudes or the projection of such attitudes (see Analytic ethics; Emotivism; Projectivism).

Another possibility is to accept that our moral practices and beliefs are committed to intuitionism and that intuitionism's incompatibility with the scientific picture of the world shows that our ethical practices and beliefs involve fundamental error (see Moral scepticism §3; Moral realism §7).

There are several possible responses to the claim that intuitionism is incompatible with a scientific picture of the world. The compatibility of these outlooks rests, it can be argued, on a proper understanding of the scientific picture of the world. In the same vein, this compatibility can be said to depend on a proper understanding of intuition. A further possible response is to say 'so much for the scientific picture'.

Intuitionistic logic and antirealism

The law of excluded middle (LEM) says that every sentence of the form $A \vee \neg A$ ('A or not A') is logically true. This law is accepted in classical logic, but not in intuitionistic logic. The reason for this difference over logical validity is a deeper difference about truth and meaning. In classical logic, the meanings of the logical connectives are explained by means of the truth tables, and these explanations justify LEM. However, the truth table explanations involve acceptance of the principle of bivalence, that is, the principle that every sentence is either true or false. The intuitionist does not accept bivalence, at least not in mathematics. The reason is the view that mathematical sentences are made true and false by proofs which mathematicians construct. On this view, bivalence can be assumed only if we have a guarantee that for each mathematical sentence, either there is a proof of the truth of the sentence, or a proof of its falsity. But we have no such guarantee. Therefore bivalence is not intuitionistically acceptable, and then neither is LEM.

A realist about mathematics thinks that if a mathematical sentence is true, then it is rendered true by the obtaining of some particular state of affairs, whether or not we can know about it, and if that state of affairs does not obtain, then the sentence is false. The realist further thinks that mathematical reality is fully determinate, in that every mathematical state of affairs determinately either obtains or does not obtain. As a result, the principle of bivalence is taken to hold for mathematical sentences. The intuitionist is usually an antirealist *about mathematics, rejecting the idea of a fully determinate, mind-independent mathematical reality.*

The intuitionist's view about the truth-conditions of mathematical sentences is not obviously incompatible with realism about mathematical states of affairs. According to Michael Dummett, however, the view about truth-conditions implies antirealism. In Dummett's view, a conflict over realism is fundamentally a conflict about what makes sentences true, and therefore about semantics, for there is no further question about, for example, the existence of a mathematical reality than as a truth ground for mathematical sentences. In this vein Dummett has proposed to take acceptance of bivalence as actually defining a realist position.

If this is right, then both the choice between classical and intuitionistic logic and questions of realism are fundamentally questions of semantics, for whether or not bivalence holds depends on the proper semantics. The question of the proper semantics, in turn, belongs to the theory of meaning. Within the theory of meaning Dummett has laid down general principles, from which he argues that meaning cannot in general consist in bivalent truth-conditions. The principles concern the need for, and the possibility of, manifesting one's knowledge of meaning to other speakers, and the nature of such manifestations. If Dummett's argument is sound, then bivalence cannot be justified directly from semantics, and may not be justifiable at all.

1 Standard intuitionistic logic

The term 'intuitionistic logic' is used in two related senses. In the first sense, intuitionistic logic is the set of logical principles which are valid according to general intuitionism, as originally proposed by the Dutch mathematician L.E.J. Brouwer (1908). In the second, more standard, sense, intuitionistic logic is the logic determined by any one of several equivalent sets of logical rules and axioms. Such an axiom system, motivated by Brouwer's ideas, was first proposed by the Dutch logician Arend Heyting (1930) (see Intuitionism).

Usually, the phrase 'intuitionistic logic' is taken to mean the logic you get by accepting classical logic and withdrawing your acceptance of the law of excluded middle (LEM). LEM is the law according to which every sentence of the form $A \vee \neg A$ is logically true. Intuitionistically, this law is rejected. This means that the intuitionist is not allowed to assert a sentence $A \vee \neg A$ purely on logical grounds. It does not mean that the negation of that sentence may be asserted. Intuitionistically, as much as classically, the sentence $\neg(A \vee \neg A)$ is a contradiction.

Because of the inconsistency of $\neg(A \vee \neg A)$ we are allowed to infer its negation, $\neg\neg(A \vee \neg A)$. Classically, we could now infer $A \vee \neg A$, because the rule of double negation elimination (DNE), that is, the rule that from $\neg\neg A$ you may infer *A*, is valid in classical logic. Therefore, DNE is also not intuitionistically valid. By equally simple, intuitionistically acceptable reasoning, you can infer DNE from LEM. In fact, in natural deduction, systems for intuitionistic logic differ from their classical counterparts precisely by not containing DNE.

Classically, LEM is valid in virtue of the truth table explanations of the propositional constants. By the explanation of ‘ $\neg$’, either *A* is true or $\neg A$ is true, and by the explanation of ‘ $\vee$’, nothing more is needed for the truth of $A \vee \neg A$. So those who reject LEM must understand these logical constants in a different way.

2 Logic from the intuitionistic viewpoint

L.E.J. Brouwer is commonly regarded as the father of intuitionism, but he himself traces the intuitionist tradition back at least to Kant, who thought of intuitions of space and time as basic to mathematics (see Kant, I. §5). In Heyting (1934) the following two theses characterize intuitionism:

(1) Mathematics has not only formal significance, but also content.
(2) Mathematical objects are immediately grasped by the thinking subject; therefore mathematical knowledge is independent of experience.

Heyting then subdivides intuitionism into ‘half-intuitionism’ and intuitionism proper. The half-intuitionist holds that mathematical objects exist independently of our thinking, but can be known by means of our mathematical constructions. The full-blown intuitionist denies this, or at least rejects the idea that the thesis of mind-independent existence of mathematical objects can be used as a means of mathematical proof.

How can the realistic view of mathematical objects be used as a means of proof? Precisely because that view licenses the use of the law of excluded middle. If mathematical objects exist independently, and have all their properties independently, then, for instance, either, as a matter of fact, the sequence of digits 0123456789 does occur somewhere in the decimal expansion of π, or, as a matter of fact, it does not. For each mathematical statement, either mathematical reality renders that statement true, or else it does not, in which case the statement is false. In this way mathematical realism justifies LEM. LEM, in turn, is used as a means of proof.

Brouwer rejected mathematical realism. He thought that mathematics is an activity where propositions are proved by means of mental constructions, and above all that such mental constructions are precisely what make mathematical propositions true. The statement that 0123456789 does occur somewhere in the decimal expansion of π is rendered true by a construction, for example, by the construction of the decimal expansion up to the point where the sequence occurs, and is rendered false by a construction which proves that it cannot ever occur. And (roughly) a disjunction is rendered true by having one of its disjuncts rendered true. On this view, we are not in advance justified in asserting that the sequence either does or does not occur, for we have no guarantee, before a proof is actually found, that either we can carry out the verifying construction or else we can carry out the falsifying construction.

On these grounds Brouwer rejected LEM. He went further, in that, in sharpest contrast to the formalist school in the philosophy of mathematics (see Hilbert’s programme and formalism), he refused to accept logic at all as a separate source of knowledge in mathematics. In particular, that a set of mathematical axioms is consistent is not in itself a good reason, according to Brouwer, for accepting them. The relation between logic and mathematics is the opposite. Logical validity depends on insight in the nature of mathematical truth. And this leads to an understanding of the logical operators themselves.

3 Bivalence and the meaning of the logical constants

The truth table explanations give the meaning of the classical propositional constants. For instance, the meaning of ‘ $\rightarrow$’ is given by the fact, or stipulation, that $A \rightarrow B$ is false if *A* is true and *B* false, and true in the other three cases. This gives the classical meaning of ‘ $\rightarrow$’ for the reason that these four truth-value combinations exhaust all possibilities, which, in turn, involves the principle of *bivalence*, the principle that each statement is either true or false.

Under default assumptions, bivalence holds if and only if LEM is valid. The default assumptions are two: first, that $(A \vee B)$ is true if *A* is true or *B* is true. Second, that $\neg A$ is true if *A* is false.

The intuitionist does not accept the principle of bivalence. Again, this means that the intuitionist is not allowed, without further justification, to assert of a sentence *A* that it is either true or false. It does not mean that the intuitionist may assert that there are sentences which are neither true nor false. In fact, the question whether there are such sentences is a quite separate issue (see Vagueness §3; Presupposition §2; Many-valued logics,

philosophical issues in). However, the intuitionist as well as the classical logician may adopt the view that some sentences are neither true nor false, for example, because of non-referring singular terms. The modified classical logician will then claim that each sentence is either true, or false, or neither true nor false, and the modified intuitionist will not accept this principle.

The intuitionist also accepts the truth tables, but for the intuitionist they do not explain the meaning of the constants. Since the principle of bivalence is not accepted, it cannot be assumed that the entries in the truth tables exhaust all possibilities. The intuitionist may be allowed to assert $A \rightarrow B$, on the basis of a deduction of *B* from *A*, without being allowed to assert that either *A* is false or *B* is true.

On the intuitionistic conception, a mathematical proposition is true only if there is a proof of it. Moreover, the *meaning* of a mathematical sentence is closely tied to what counts as a proof of it. This is the leading idea in the Brouwer-Heyting or Brouwer-Heyting-Kolmogorov interpretation of the logical constants. Heyting once suggested that a mathematical sentence expresses an expectation of finding a proof of it. The meaning of '$\vee$' is then recursively explained by saying that a sentence $A \vee B$ expresses an expectation which is fulfilled just in case at least one of the expectations expressed by *A* and by *B* is fulfilled.

The modern version of this kind of explanation is due primarily to Michael Dummett (1973). Dummett suggests that we can correlate forms of sentence to forms of proof. There is no one form that is common to all proofs of a sentence $A \vee B$, but we can make a distinction between 'canonical' and 'non-canonical' proofs, proposed by both Dummett and the Swedish logician Dag Prawitz (1974), such that a canonical proof of $A \vee B$ is a proof consisting of either a proof of *A* or a proof of *B*. Non-canonical proofs are constructions which give us *effective* methods of finding canonical proofs. An effective method is a method which is guaranteed to yield the result after a finite number of elementary steps.

Then a proof of $A \vee B$ either consists of a proof of *A* or a proof of *B*, or of an effective method of finding the one or the other. A canonical proof of $A \,\&\, B$ is a pair of proofs, of *A* and of *B* respectively. A canonical proof of $A \rightarrow B$ is an effective method of transforming any proof of *A* into a proof of *B*. A canonical proof of $\neg A$ is an effective method of transforming any proof of *A* into a proof of '$\bot$' (absurdity - a sentence constant that is false by definition), and therefore a proof of the impossibility of a proof of *A*. A canonical proof of $\forall x A$ is an effective method for finding, for any term *t*, a proof of *At*. A canonical proof of $\exists x A$ is a proof of *At*, for some term *t*.

These are the intended intuitionistic interpretations of the logical constants. It follows from these meaning explanations that a non-canonical proof of $A \vee \neg A$ is an effective method for finding either a proof of *A* or a proof of $\neg A$. If there is such a non-canonical proof of $A \vee \neg A$, then *A* is called 'effectively decidable' (in Dummett's terminology, which we follow in §6; more technically, the term applies to predicates, or infinite classes of sentences). However, the notion of an absolutely undecidable sentence, that is, of a sentence *A* such that neither *A* nor $\neg A$ can be proved at all, does not make sense intuitionistically. *A* cannot be proved only if it can be proved that *A* cannot be proved (since truth amounts to provability), but such a proof constitutes a proof of $\neg A$, contradicting the second assumption that $\neg A$ cannot be proved.

A semantic idea that is closely related to the Brouwer-Heyting-Kolmogorov interpretation is the idea that the meaning of the logical constants is given by the rules for them in natural deduction, as first devised by Gerhard Gentzen (1934) and later developed by Prawitz (1965) (see Logical constants §4). In particular there is a close analogy between the introduction rules in natural deduction and the forms of canonical proofs. For instance, the introduction rule for 'Čamp;' is that $A \,\&\, B$ may be inferred from the joint premises of *A* and *B*. From this alternative perspective, introduction rules are valid by definition, and all other rules are to be justified with respect to these.

From both these kinds of meaning-explanation, standard intuitionistic logic is justifiable and LEM is not. But the question is whether further rules than the standard ones are valid. This could be answered in the negative by a proof of semantic completeness, that is, of the statement that all intuitionistically valid principles are derivable from standard intuitionistic logic. Such a proof would have to invoke the intended interpretations rather than some other semantics, and it would have to employ only intuitionistically valid modes of reasoning. At the time of writing, it is not clear that such a proof can be found.

4 Dummett on antirealism and semantics

Brouwer rejected mathematical realism, rejected the law of excluded middle and adopted the idea that mathematical statements are true in virtue of mental constructions. These views naturally go together, but their interrelations are non-trivial.

Antirealism, that is, rejection of realism, comes in many forms. The most direct form is a denial of the existence of entities, for example, the existence of universals. Brouwer denied the existence of extra-mental mathematical objects. If this is denied, then there is a question of evaluating mathematical sentences. Since we want to preserve standard arithmetical judgments, we must understand a sentence such as ‘ $2 + 2 = 4$’ so that neither its meaningfulness, nor its truth, depends on the existence of entities of the rejected kind. One possibility is to interpret the sentence in terms of mental constructions, as Brouwer did, but it is not the only one. You can also reinterpret arithmetical sentences, for example, so as to make them true or false by virtue of facts about numerals and their operators. You can even do it in such a way that, if you are a realist about numerals, the principle of bivalence remains valid. So not every form of antirealism will necessitate a change of logic. It will always depend on the way the sentences are reinterpreted.

The form of view suggested, combining a denial of the existence of entities (numbers) with an affirmation of bivalence for (arithmetical) sentences, has been categorized by Dummett as a form of sophisticated realism, rather than a form of antirealism. On Dummett’s view, belief in the determinacy of facts is more central to realism than belief in the existence of entities. A mathematical antirealist can accept the existence of numbers and reject the statement that every mathematical state of affairs either obtains or does not obtain. On this view we just cannot take for granted that every mathematical question has an answer in mathematical reality.

These reflections suggest a central place for the principle of bivalence in questions of realism, and that is just what Dummett has proposed. However, there are two more specific features of Dummett’s views on bivalence and realism. First, Dummett places bivalence, as a criterion of realism, in an epistemic perspective. In this perspective, realism is in the first place opposed to the knowability principle, that is, the view that if a sentence is true, then it can be known to be true (see Meaning and verification §5). If you accept bivalence, then, from the epistemic perspective, what is important is that you hold every sentence to be either true or false whether or not it is possible to find out which. And if you reject bivalence, the default reason, from the epistemic perspective, is that on the one hand you accept the knowability principle and, on the other, you do not think there is any guarantee that each sentence can be either known to be true or known to be false.

Second, Dummett regards acceptance of bivalence not just as characteristic of the realist, but as actually defining what it is to be a realist. Similarly, rejection of bivalence by definition makes you an antirealist. Although Dummett recognizes further aspects of realism and antirealism, bivalence is taken as the main dividing line. In this way realism becomes a semantic issue (hence the terms ‘semantic realism’ and ‘semantic antirealism’ in discussion of Dummett’s views).

There are three interconnected reasons for this change of perspective. First, Dummett holds that traditional metaphysical disputes are framed in pictorial language, with pictures like that of an ethereal realm of abstract entities. These pictures should be replaced by more precisely stated claims. Secondly, the conflict about, for example, the reality of the past, is a conflict about what makes our sentences about the past true, and therefore the question of the reality of the past will involve the question of the proper semantics for sentences about the past. The realist thinks that a sentence can be made true by past facts even if it is impossible for us to know what they are, and the antirealist rejects this as incoherent. Similarly for other disputes over realism. Third, if the conflict is taken as a conflict about semantics, then it can actually be resolved. It will be resolved once it has been shown what a correct meaning theory for the language in question must look like.

5 The relation between realism and bivalence

However, it may seem that Dummett has overstated the role of bivalence in metaphysics. Semantics is what connects bivalence, for some range of sentences, and the determinacy of facts in the corresponding area. What connection there is depends on the kind of semantics, that is, on how the sentences are interpreted. But it also depends on how well the meanings of the sentences are determined.

Suppose that you interpret sentences about the past according to a correspondence model, so that they are made true or false by past facts or events. The sentence ‘George Washington crossed the Potomac’ is then true, if it is true, in virtue of the event of Washington’s crossing the Potomac. Suppose further that all sentences concerned have a well-determined meaning. If a sentence has a well-determined meaning, then it depends only on reality whether or not the sentence is true.

Under these assumptions realism and bivalence are equivalent. If past reality is fully determinate, so that all past states of affairs either obtained or did not obtain, and the meanings of the sentences are such that this and nothing else is needed for making them true or false, then each sentence is true or false. And similarly, if bivalence holds, so does realism.

You may doubt that reality is fully determinate, suspecting that there might be gaps, as it were, and take this as a reason for accepting the knowability principle, thinking that our only guarantee that some state of affairs does or does not obtain is that we can get to know either that it obtains or that it does not. In that case, under the same initial assumptions, bivalence will fail. Conversely, if you accept the knowability principle for another reason, then you have a reason to reject bivalence, since there is no guarantee that each sentence can be known either to be true or to be false. Again under the same assumptions, you must reject realism.

However, if one of these two assumptions is dropped, then the equivalence is lost. Suppose that you give up the second assumption, about the determinacy of meaning. You may think, for example, that the application of a predicate such as ‘…crossed…’ to a pair of objects, such as Washington and the Potomac, is determinately either correct or incorrect only if it is within our present capacity to decide whether it is the one or the other. If we do not have that capacity, then, on this view, the meaning of the predicate is underspecified for these arguments. This view leads to the rejection of bivalence. We cannot assert that each sentence is either true or false, since if we cannot either verify or falsify a particular sentence, then, on this view, its truth-value is left indeterminate. In this case, however, there are no consequences for reality. Reality may be fully determinate. The failure of bivalence depends on meaning only, not on the world.

We get the same result if the first assumption is dropped. Suppose that we adopt a kind of verificationism for sentences about the past. We interpret them so that they are made true or false not by past facts or events, but by present evidence, that is, by such present facts as we take as grounds for asserting those sentences, such as facts about written documents or memories. Then again we have a reason to reject bivalence, for there is no guarantee that we will, for each sentence about the past, be in possession either of truth-making evidence or of falsity-making evidence. And again nothing seems to follow about realism. If sentences about the past are not made true or false by past facts, then failure of bivalence implies nothing about the determinacy of past reality.

The natural reply to the objection is that we have no conception whatsoever about the reality of the past save as that which is represented by our sentences about the past. If these sentences cannot reasonably be given a semantics according to which they are true or false in virtue of past facts, then the notion of an independent past reality must be rejected, for it is only as the truth-maker of our sentences that we have a reason to be realists about it. Moreover, we cannot then use the sentence ‘Past facts are fully determinate’ for stating an independent metaphysical truth, for this sentence must itself be evaluated according to the proposed alternative semantics.

If this reply is correct, then questions of metaphysics are *eo ipso* questions of semantics. And then, as Dummett thinks, metaphysical conflicts are to be settled within the theory of meaning. Indeed, according to Dummett (1991), expressions of metaphysical pictures of reality have no content at all in addition to the semantic views that go with them.

6 Dummett’s antirealist argument

We have seen that the principle of bivalence is of central importance both for realism and for classical logic. Bivalence itself, for any kind of sentence, or for some particular kind, is to be justified by the proper semantics for the kind of sentence in question. And what the proper semantics is, is a question in the general theory of meaning.

Within the theory of meaning Dummett has, notably in ‘What is a Theory of Meaning? (II)’ (1976), proposed general principles, from which an argument is drawn to the conclusion that a semantics of bivalent truth-conditions cannot be correct.

The first step in Dummett's reasoning is the observation that an account of linguistic meaning must be an account of linguistic understanding, that is, of knowledge of meaning. The thesis that meaning consists of truth-conditions is acceptable if and only if it is acceptable that understanding a sentence consists of knowing its truth-conditions, and similarly for other accounts of meaning.

Second, understanding must be publicly manifestable. That is, if I understand a particular sentence, then I must be able to reveal to my interlocutors that I do. This is because language is a means of communication. If there were ingredients in meaning such that knowledge of them could not be made manifest to others, then speakers could not know whether they attached the same meanings to the same expressions, and then communication, as far as those ingredients in meaning are concerned, would be impossible (see Private states and language).

Thus, if meaning consists of truth-conditions, knowledge of truth-conditions must be manifestable. But how do you manifest your knowledge of the truth-conditions of a sentence? Sometimes you can manifest your understanding by means of a verbal explanation of the meaning of the sentence, but in this way the problem is transferred to the question of your knowledge of the meaning of the sentences you use in your explanation. When you cannot, without circularity, explain further, then you must manifest your understanding in a more primitive way. Dummett says that such a manifestation is a manifestation of a particular capacity, namely, the capacity to get to know that the sentence is true, if it is true, and to get to know that it is false, if it is false. According to Dummett, this is what counts as manifesting knowledge of truth-conditions.

The next step concerns the possibility of such manifestations. If the sentence in question is effectively decidable (see §3 above), then manifesting knowledge of its truth-conditions is possible in principle, but perhaps not in practice. If a sentence is practically decidable, that is, deciding it is within the scope of ordinary human abilities, then I can manifest my knowledge of its truth-conditions by applying a decision method, like making an observation or a small number of calculations, and arrive at a knowledge of its truth-value. If the sentence is effectively decidable, but not in practice, for example, because the number of calculations needed is too large, then I can at least manifest my knowledge of a decision method for it.

The problem appears, according to Dummett, when we come to sentences which are not effectively decidable. A sentence such as 'Two million days before the birth of Benjamin Franklin, an even number of birds landed on Mount St Helen' is not effectively decidable, for we have no method today which is guaranteed to give the right answer. In this case I do not have a capacity to get to know the truth-value, and therefore I cannot manifest my knowledge of its truth-conditions.

The sentence is clearly meaningful, and I clearly understand it. Since knowledge of meaning must be manifestable, and I cannot manifest my knowledge of bivalent truth-conditions in this case, knowledge of its meaning cannot be knowledge of bivalent truth-conditions. Hence, Dummett concludes, meaning does not in general consist of bivalent truth-conditions.

If this argument is sound, then the principle of bivalence cannot be justified in the most natural way, that is, directly from the proper semantics of the sentences it concerns, for that is not a semantics of bivalent truth-conditions. As Dummett points out, this does not in itself invalidate the bivalence principle, since the argument allows that bivalence may be justified in some other way. It seems plausible, however, that bivalence cannot be justified in any way allowed for by Dummett's meaning-theoretical principles.

If bivalence cannot be justified for some particular class of sentences, then neither can semantic realism for that class of sentences. And, since logical principles are perfectly general and topic neutral, if there is some class for which bivalence fails, then, under the default assumptions about the relation between bivalence and LEM (§3), LEM is not a logical law.

This is the destructive aspect of Dummett's enterprise. It has been criticized by a number of philosophers. One objection, due to McDowell (1987), is that the requirement of (full) manifestability is too strong, and another is that Dummett has a rigid and unjustified view of how knowledge of truth-conditions may be manifested.

The constructive aspect is a project of outlining a kind of semantics that satisfies Dummett's own requirements. The model for such a semantics, according to Dummett, is precisely the intuitionistic interpretation of the logical constants. The question is whether this idea can be generalized, in particular from logic and mathematics to

empirical sentences. Such a generalization would amount to some form of verificationism, that is, a view according to which the meaning of a sentence is somehow given by the method, or methods, of verifying the sentence. There are, however, many ways of verifying a verifiable sentence, and only some are directly connected with its meaning. In accordance with the intuitionistic interpretation of the logical constants we should therefore distinguish between canonical and non-canonical, or direct and indirect, verifications of a sentence. Then we can say that the meaning of a declarative sentence is given by what counts as a direct verification of it. On this model, understanding of a sentence would be manifested by exercising an ability to decide, for every proposed piece of evidence, whether or not it constitutes a verification of the sentence. The point is that we can be credited with such an ability even in cases where we in fact do not know how to find a verification. It is enough that we can recognize it if we find it. Therefore the requirement of manifestability is taken to be fulfilled.

However, it has been claimed by Wright (1987) that if full manifestability is required, then problems begin already with sentences not decidable in practice, for example, sentences whose shortest proofs are too long to be surveyable by humans. But, as Wright points out, a finite upper bound on the length of proofs cannot be acknowledged within intuitionism.

Dummett rejects such finite upper bounds, but in fact leaves it open whether intuitionistic logic meets all the meaning-theoretic requirements. He does not, however, see any *principled* reason for doubting it, as he does in the case of classical logic, with its accompanying realism.

The book as a whole is to a great extent concerned with Dummett's projects, both the negative and the positive.)

Iqbal, Muhammad (1877-1938)

Muhammad Iqbal was an outstanding poet-philosopher, perhaps the most influential Muslim thinker of the twentieth century. His philosophy, though eclectic and showing the influence of Muslims thinkers such as al-Ghazali and Rumi as well as Western thinkers such as Nietzsche and Bergson, was rooted fundamentally in the Qur'an, which Iqbal read with the sensitivity of a poet and the insight of a mystic. Iqbal's philosophy is known as the philosophy of khudi *or Selfhood. Rejecting the idea of a 'Fall' from Eden or original sin, Iqbal regards the advent of human beings on earth as a glorious event, since Adam was designated by God to be God's viceregent on earth. Human beings are not mere accidents in the process of evolution. The cosmos exists in order to make possible the emergence and perfection of the Self. The purpose of life is the development of the Self, which occurs as human beings gain greater knowledge of what lies within them as well as of the external world. Iqbal's philosophy is essentially a philosophy of action, and it is concerned primarily with motivating human beings to strive to actualize their God-given potential to the fullest degree.*

1 Life

Muhammad Iqbal was born at Sialkot in India in 1877. His ancestors were Kashmiri Brahmans; his forefathers had a predilection for mysticism, and both his father, Nur Muhammad, and his mother, Imam Bibi, had a reputation for piety. An outstanding student, Iqbal won many distinctions throughout his academic career. He passed the intermediate examination from the Scotch Mission School in Sialkot in 1893 and then moved to the Government College in Lahore, where he graduated in 1897. In 1899 he obtained a master's degree in Arabic. Having been deeply influenced by Sir Thomas Arnold, the well-known scholar of Islam, while he was at the Government College, Iqbal followed his advice and proceeded to Trinity College, Cambridge in October 1905, graduating in 1907 having studied philosophy under J.M.E. McTaggart. His doctorate was taken at Munich University, with a thesis entitled *The Development of Metaphysics in Persia*.

On his return from Europe in July 1908, Iqbal took up the post of Professor of Philosophy and English Literature at the Government College in Lahore, and also began his law practice. In 1911 he gave up his teaching career because he felt that he had a message to deliver and could do it better if he adopted an independent profession such as law. However, he always remained interested in education and was associated with the Oriental College, the Government College and the Islamia College in Lahore, and with the Jami'a Millia in Delhi. During the sessions of the Round Table Conferences in London he worked on the various committees connected with educational reforms. In 1933 Iqbal, along with some others, was invited by the Afghan government to visit the country and advise the government and Kabul University on educational matters.

Iqbal also took an interest in the workings of the Muslim League, but did not participate actively in politics. During the period 1910-23 he tried instead to create political consciousness and bring about an awakening of Indian Muslims. In 1924 Iqbal became a member of the National Liberal League of Lahore; in 1926 he was elected a member of the Punjab Legislative Assembly, and in 1930 was elected president of the All-India Muslim League, where he delivered a historic address. He took part in the Second and Third Round Table Conferences held in London, and was most disappointed with the outcome. Iqbal was knighted on 1 January 1923. His last years were clouded with ill health. After his death in 1938 he was buried near the gate of the Badshahi Mosque in Lahore, with many attending and millions in mourning.

2 Works

A precocious youth, Iqbal began to write poetry at a very early age, and soon after he came to Lahore he became known through his participation in poetic symposia. As a young poet, he came under the influence of Mirza Dagh Dehalvi, one of the renowned exponents of Urdu poetry. An organization to which Iqbal was devoted all his life was the Anjuman-e-Himayat-e-Islam (Society for the Support of Islam). The annual sessions of the Anjuman fulfilled an acute emotional need of Indian Muslims and became national festivals. Iqbal read his poems regularly at these sessions, and in fact his poems were the main attraction for the thousands who flocked to Lahore, almost on an errand of pilgrimage, to see and hear him. It was at an Anjuman meeting in April 1911 that Iqbal read his famous 'Shikwa' (The Complaint), a poem which commands such a unique place in Urdu literature that Iqbal's fame could rest securely on it alone.

The publication of *Asrar-e-khudi (The Secrets of the Self)* in 1915 was a significant event. It was followed by *Rumuz-e-bekhudi (The Mysteries of Selflessness)*, which dealt with the development of the communal ego, in 1918; *Payam-e-mashriq (The Message of the East)*, Iqbal's answer to Goethe's *West-Östlicher Divan*, in 1923 (see Goethe, J.W. von); *Zabur-e-'ajam (The Persian Psalms)* in 1927; *Javid nama (The Pilgrimage of Eternity)*, Iqbal's magnum opus modelled on Dante's *Divine Comedy*, in 1932; *Musafir (The Traveller)* in 1934; *Bal-e-Jibril (Gabriel's Wing)* in 1935; *Zarb-e-Kalim (The Stroke of Moses)* and *Pas che bayad kard ai aqwam-i-sharq? (So What Should be Done, O Nations of the East?)* in 1936. *Armaghan-e-hijaz (The Gift of Hijaz)*, containing both Persian and Urdu verse, appeared posthumously in 1938. As well as his poetical works, Iqbal wrote three works in prose. *'Ilm-ul-iqtisad (The Study of Economics)*, which was the first book on political economy to be published in Urdu, appeared in 1903; Iqbal's doctoral thesis, *The Development of Metaphysics in Persia* was published in 1908; and his lectures, *The Reconstruction of Religious Thought in Islam*, were first published in 1930. Iqbal also wrote numerous articles in Urdu and English in various journals and newspapers.

3 Philosophy of the self

Iqbal's philosophy is often described as the philosophy of *khudi*, or the Self. For him, the fundamental fact of human life is the absolute and irrefutable consciousness of one's own being. For Iqbal, the advent of humanity on earth is a great and glorious event, not an event signifying human sinfulness and degradation. He points out that according to the Qur'an, the earth is humanity's 'dwelling-place' and 'a source of profit' to it. Iqbal does not think that having been created by God, human beings were placed in a supersensual paradise from which they were expelled on account of an act of disobedience to God. Pointing out that the term 'Adam' functions as the symbol of self-conscious humanity rather than as the name of an individual in the Qur'an, Iqbal describes the 'Fall' as a transition from 'a primitive state of instinctive appetite to the conscious possession of a free self, capable of doubt and disobedience' (Iqbal 1930: 85). For Iqbal, Adam's story is not the story of the 'First Man' but the ethical experience, in symbolic form, of every human being. Following the Qur'anic teaching that though human beings come from the earth, God's spirit has been breathed into them, Iqbal holds on the one hand that human beings are divinely created, and on the other hand that they have evolved from matter. Unlike dualists, Iqbal sees no impassable gulf between matter and spirit, nor does he see human beings as a mere episode or accident in the huge evolutionary process. On the contrary, the whole cosmos is there to serve as the basis and ground for the emergence and perfection of the Ego. Humanity's evolution has not come to an end, for the destiny of human beings lies 'beyond the stars'.

The purpose of life is the development of the Self. In order that they may achieve the fullest possible development, it is essential for human beings to possess knowledge. Following the Qur'an, Iqbal maintains that there are two sources of knowledge: the inner consciousness of human beings and the outer world of nature. Starting with the intuition of the Self, human beings become aware of the Not-Self, the confronting 'other' which provides a constant challenge for them. Nature, however, does not confront God in the same way as it confronts humanity, since it is a phase of God's consciousness. God is immanent since God comprehends the whole universe, but also transcendent since God is not identical with the created world. All life is individual. There is a gradually rising scale of selfness running from the almost inert to God who is the Ultimate Ego. God is not immobile nor is the universe a fixed product; God is constantly creative and dynamic and the process of Creation still goes on. The Qur'anic saying, 'Toward God is your limit' (Surah 53: 42), gives Iqbal an infinite worldview, and he applies it to every aspect of the life of humanity and the universe.

Iqbal distinguishes between two aspects of the Self, the efficient and the appreciative. The efficient self is that which is concerned with, and is itself partially formed by, the physical world. It apprehends the succession of impressions and discloses itself as a series of specific, and consequently numerable, states. The appreciative self is the deeper self, of which one becomes aware only in moments of profound meditation when the efficient self is in abeyance. The unity of the appreciative self is that in it, each experience permeates the whole. The multiplicity of its elements is unlike that of the efficient self. There is change and movement, but this change and movement are indivisible; their elements interpenetrate and are wholly non-serial in character.

Corresponding to the two aspects of the Self are the two levels of time, serial time and pure duration. Serial time is spatialized or clock time, whereas pure duration is a ceaseless continuous flow in which all things live and move and have their being. As human beings perfect their egohood, they cast off the girdle of serial time and gain a

measure of eternity.

Iqbal believes ardently that human beings are the makers of their own destiny and that the key to destiny lies in one's character. He constantly refers to the Qur'anic verse, 'Verily God will not change the condition of a people till they change what is in themselves' (Surah 13: 12). Humanity's mission on earth is not only to win greater freedom but also to gain immortality, which according to Iqbal 'is not ours by right; it is to be achieved by personal effort. Man is only a candidate for it' (Iqbal 1930: 119).

Though humanity is the pivot around which Iqbal's philosophy revolves, yet as pointed out by Schimmel, Iqbal's 'revaluation of Man is not that of Man qua Man, but of Man in relation to God' (Schimmel 1963: 382). Iqbal's Ideal Person is the Servant of God. The relation between humanity and God is a personal one; hence the great importance of prayer in the thought of Iqbal. The belief in the one living God gives humanity freedom from all false deities and fortifies it against forces of disintegration. Iqbal sees his concept of the Ideal Person realized in the Prophet of Islam, whose life exemplifies all the principles dearest to Iqbal's heart. In his view art, religion and ethics must be judged from the standpoint of the Self. That which strengthens the Self is good and that which weakens it is bad. Iqbal does not admit the absolute existence of evil but regards it as being necessary for the actualization of moral purpose as vital activity in the world. His Iblis (or *al-Shaytan*, Satan) is the counterpart to his Ideal Person (see Free will; Self, Indian theories of).

4 Epistemology

Iqbal cannot be easily or exclusively classified as an empiricist, rationalist or intuitionist since he combines sense-perception, reason and intuition in his theory of knowledge (see Epistemology in Islamic philosophy). He defines knowledge as 'sense-perception elaborated by understanding' ('understanding' here does not stand exclusively for 'reason' but for all non-perceptual modes of knowledge). There are two ways of establishing connections with the Reality that confronts us. The direct way is by means of observation and sense-perception; the other way is through direct association with that Reality as it reveals itself within.

Iqbal compares the classical spirit with its contempt for sense-perception with the empirical attitude of the Qur'an 'which sees in the humble bee a recipient of Divine inspiration and constantly calls upon the reader to observe the perpetual change of the winds, the alterations of day and night, the clouds, the starry heavens and the planets swimming through infinite space' (Iqbal 1930: 91) The cultures of the ancient world failed, says Iqbal, because their approach to reality was entirely introspective as they moved from within outwards. This gave them theory without power, and no durable civilization can be based on mere theory.

Iqbal distinguishes between 'logical understanding', which has a sectional nature and 'the deeper movement of thought', which is identical with intuition. He frequently points out (particularly in his poetry) the limitations of the former, but this does not mean that he was an anti-rationalist or anti-intellectual. Iqbal cites enthusiastically the Qur'anic verses (2: 28, 31) which state that Adam's superiority over angels lay in his power to 'name' things, that is, to form concepts. Concepts are not abstract logical entities: they are based on, and indissolubly linked with, facts of sensation. It is the knowledge of things and their inherent nature that exalted Adam over celestial creatures, and it is only through an unceasing struggle to attain the knowledge of things that humanity can maintain its superiority with justice in the world. Without discursive 'intellect' science would be impossible, and without science very little progress would be made in the material sphere. Iqbal believed strongly in the power and utility of science, but he did not regard science as the measure of all things. Science seeks to establish uniformities of experience, that is, the laws of mechanistic repetition, but does not take account of feelings, purposes and values. In Iqbal's opinion, the predicament of present-day humanity is that its life is wholly overshadowed by the results of its intellectual activity and it has ceased to live soulfully, or from within, having been cut off from the springs of life.

Like the existentialists, Iqbal sounds a warning that an idolatrous attitude towards reason and science leads in the direction of dehumanization. Since he puts great emphasis on intuition as a mode of knowledge, there has been much debate on the apparent conflict between reason and intuition in his works. However, Iqbal regarded reason and intuition as organically related and considered both to be necessary for the fulfilment of human destiny. Equating scientific knowledge with *'aql* (reason) and mystic knowledge with *'ishq* (love), Iqbal struggles constantly against separating the former from the latter since he believes that without love, reason becomes

demonic.

5 Political philosophy

Of all the parts of his thought, Iqbal's political philosophy is perhaps the most commonly misunderstood. This misunderstanding is largely the result of dividing his political philosophy into phases, such as the nationalistic phase, the pan-Islamic phase and the last phase in which he pioneered the Muslim independence movement. By regarding each phase as being quite different from and independent of the other phases, one almost always reaches the conclusion that either Iqbal's political views changed with astonishing rapidity or that he could not make up his mind and was inconsistent. One can indeed see Iqbal first as a young poet with rather narrow parochial sympathies which gradually widened into love of homeland, and then gave way to love of Islam which later became transformed into love of humanity. However, he can also be seen as a visionary, whose ideal from first to last was the realization of God's Kingdom on Earth, who believed in the interrelatedness, equality and freedom of human beings, and who strove at all times to achieve these goals; and by viewing Iqbal in this one light, one attains a much better understanding of his political philosophy.

Iqbal's interest in politics was secondary not primary. In his historic address at Lahore, in 1932, he made this clear:

> Politics have their roots in the spiritual life of Man. It is my belief that Islam is not a matter of private opinion. It is a society, or if you like, a civic Church. It is because present-day political ideals, as they appear to be shaping themselves in India, may affect its original structure and character that I find myself interested in politics.
>
> (Iqbal 1964: 288)

Iqbal's impact on the political situation of the Muslims in India was so great that he is hailed as the 'spiritual' founder of Pakistan. Undoubtedly, there was much focus on the Islamic community in his major works written between 1908 and 1938. Nevertheless, when accused by Lowes Dickinson of being exclusive in his thinking, Iqbal denied the allegation and said:

> The humanitarian ideal is always universal in poetry and philosophy, but if you make it an effective ideal…you must start, not with poets and philosophers, but with a society exclusive in the sense of having a creed and well-defined outline…. Such a society according to my belief is Islam. This society has so far proved itself a more successful opponent of the race-idea which is probably the hardest barrier in the way of the humanitarian ideal…. All men and not Muslims alone are meant for the Kingdom of God on earth, provided they say goodbye to their idols of race and nationality and treat one another as personalities. The object of my Persian poems is not to make out a case for Islam: my aim is simply to discover a universal social reconstruction, and in this endeavour, I find it philosophically impossible to ignore a social system which exists with the express object of doing away with all the distinctions of caste, rank and race.
>
> (Iqbal 1964: 98-9)

6 Critical evaluation

Iqbal undertook the task of uniting faith and knowledge, love and reason, heart and mind. In the case of a writer at once so prolific and so provocative, there is bound to be considerable controversy in the evaluation of the measure of his success. Some regard Iqbal's thought as mainly eclectic, while others regard it as exciting and original. But surely it is true that if any thinker has succeeded - to whatever degree - in the task of building a bridge between East and West, it is Iqbal.

One of the most important questions to be asked regarding Iqbal's work as a philosopher is, from what point of view is it to be judged? Inevitably the work of every philosopher must be subjected to the test of coherence and consistency. On the whole, Iqbal's philosophy sustains this test. Like any other philosopher he has first principles which seem to him self-evident, and which he therefore does not seek to defend. Like most other philosophers, there are times and places where he is not very clear or is evasive and unwilling to commit himself. Many writers have also seen a number of contradictions (which appear in some specific part of his thought, usually in his socio-political philosophy) disappear when viewed in the larger context of his total philosophy.

RIFFAT HASSAN

List of works

Iqbal, M. (1903) *'Ilm-ul-iqtisad (The Science of Economics)*, Lahore: Iqbal Academy, 1961.(Iqbal's first published book in Urdu was also the first book on economics to be published in Urdu, and contains a number of important socioeconomic ideas which were to become important elements of his philosophy of the individual and communal ego.)

Iqbal, M. (1908) *The Development of Metaphysics in Persia*, Cambridge: Cambridge University Press; Lahore: Bazm-Iqbal, 1964.(Iqbal's doctoral dissertation in which he traces the logical continuity of Persian thought.)

Iqbal, M. (1915) *Asrar-e-khudi (The Secrets of the Self)*, Lahore: Shaikh Ghulam Ali and Sons; trans. R.A. Nicholson, Lahore: Shaikh Muhammad Ashraf, 1950.(Iqbal's first volume of poetry in Farsi, in which he laid the foundations of his philosophy of life based on the mysticism of the struggle, the continuing endeavour of the self to fully actualize its potential.)

Iqbal, M. (1918) *Rumuz-e-bekhudi (The Mysteries of Selflessness)*, Lahore: Shaikh Ghulam Ali and Sons; trans. A. Arberry, London: John Murray, 1953.(This volume of Farsi poetry is concerned with the role of the individual in a community and forms the basis of Iqbal's social and political philosophy.)

Iqbal, M. (1923) *Payam-e-mashriq (The Message of the East)*, Lahore: Shaikh Muhammad Ashraf.(This volume of Farsi poetry was inspired by Goethe's *West-Östlicher Divan*, and highlights those social and religious ideas which have a bearing on the spiritual development of individuals and communities.)

Iqbal, M. (1924) *Bang-e-dara (The Sound of the Caravan Bell)*, Lahore: Shaikh Ghulam Ali and Sons.(Iqbal's first collection of poetry in Urdu, which contains some of his best known and most inspiring poems such as 'Shikwa' (The Complaint) and 'Jawab-e-shikwa' (The Response to the Complaint).)

Iqbal, M. (1927) *Zabur-e-'ajam (The Persian Psalms)*, Lahore: Shaikh Ghulam Ali and Sons.(In this volume of Farsi poetry, Iqbal's philosophy of love finds exquisite expression.)

Iqbal, M. (1930) *The Reconstruction of Religious Thought in Islam*, Lahore: Shaikh Muhammd Ashraf. (This is one of the most important works of philosophy in modern Islam, in which Iqbal formulates a new Muslim metaphysics in the light of the philosophical tradition of Islam and recent developments in various domains of human knowledge.)

Iqbal, M. (1932) *Javid nama (The Pilgrimage of Eternity)*, Lahore: Shaikh Ghulam Ali and Sons.(This volume of Farsi poetry is Iqbal's magnum opus, modelled on the Prophet's *me'raj* or ascension to the presence of God, which is a symbol of self-realization.)

Iqbal, M. (1933) *Musafir (The Traveller)*, Lahore: Shaikh Mubarak Ali.(This volume of Farsi poetry records Iqbal's visit to Afghanistan at the invitation of King Nadir Shah.)

Iqbal, M. (1935) *Bal-e-Jibril (Gabriel's Wing)*, Lahore: Shaikh Mubarak Ali.(Iqbal's second volume of poetry in Urdu is an acknowledged masterpiece in terms of its literary quality and its prophetic call to action.)

Iqbal, M. (1936) *Zarb-e-alim (The Stroke of Moses)*, Lahore: Shaikh Ghulam Ali and Sons.(This volume of Urdu poetry contains Iqbal's critique of the modern age in the light of the symbol of Moses, a seeker of God who insisted on seeing God.)

Iqbal, M. (1938) *Armaghan-i-hijaz (The Gift of Hijaz)*, Lahore: Shaikh Ghulam Ali and Sons.(This volume, containing both Farsi and Urdu poetry, was published posthumously and sums up what Iqbal believed to be the teaching of the Prophet from the Hijaz, the symbol of the desert which represents a life of struggle and austerity.)

Iqbal, M. (1948) *Speeches and Statements*, ed. Shamloo, Lahore: Al-Manar Academy. (Collection of shorter works on a variety of subjects.)

Iqbal, M. (1961) *Stray Reflections*, ed. J. Iqbal, Lahore: Shaikh Ghulam Ali and Sons.(Collection of Iqbal's reflections on a number of topics, ranging from the philosophical to the practical.)

Iqbal, M. (1964) *Thoughts and Reflections of Iqbal*, ed. S.A. Vahid, Lahore: Shaikh Muhammad Ashraf. (Contains Iqbal's historic addresses and significant writings on a number of subjects.)

Irigaray, Luce (1930-)

Luce Irigaray holds doctorates in both linguistics and philosophy, and has practised as a psychoanalyst for many years. Author of over twenty books, she has established a reputation as a pre-eminent theorist of sexual difference - a term she would prefer to 'feminist'. The latter carries with it the history of feminism as a struggle for equality, whereas Irigaray sees herself more as a feminist of difference, emphasizing the need to differentiate women from men over and above the need to establish parity between the sexes.

Speculum de l'autre femme (1974) (Speculum of the Other Woman) (1985), the book that earned her international recognition, fuses philosophy with psychoanalysis, and employs a lyrical 'mimesis', or mimicry, that parodies and undercuts philosophical pretensions to universality. While adopting the standpoint of universality, objectivity and uniformity, the philosophical tradition in fact reflects a partial view of the world, one which is informed by those largely responsible for writing it: men. Without the material, maternal and nurturing succour provided by women as mothers and homemakers, men would not have had the freedom to reflect, the peace to think, or the time to write the philosophy that has shaped our culture. As such, women are suppressed and unacknowledged; femininity is the unthought ground of philosophy - philosophy's other.

1 Life and works

Born in Belgium, Luce Irigaray first studied literature, focusing on Paul Valéry, and her early training was at Louvain. She completed her Doctorate of Letters at the University of Paris VIII, and has lived in France since that time. Her thesis was later published in 1974 as *Speculum de l'autre femme* (1974) (*Speculum of the Other Woman*, 1985). In 1977 a collection of articles and interviews, *Ce sexe qui n'est pas un* (1977) (*This Sex Which is Not One*, 1985), appeared. Translations of both books were published in 1985, and these are the two early works for which she is still best known in the English-speaking world. She is better known in Italy, where she has established a large following, has contributed frequently to a Communist Party paper, and has engaged with public dialogues with Renzo Imbeni, an Italian politician to whom her book *J'aime à toi* (1992) is dedicated.

While at times she insists on the importance of her philosophical contribution, her work is also heavily indebted to Jacques Lacan, whose psychoanalytic theory remains an important influence in her more recent work, such as *Sexes et parentés* (1987) (*Sexes and Genealogies*, 1987) - despite the break with Lacan after the appearance of *Speculum* in 1974. Luce Irigaray is the Director of the Centre National de la Recherche Scientifique, where she established an international team to work on linguistic patterns in relation to gender, the focus of her most recent work.

In a 1994 interview (Hirsh and Olson 1995) Luce Irigaray divides her work into three periods. The first stage includes *Speculum of the Other Woman* and *This Sex Which is Not One*, and is characterized as a critique of the way in which 'a single subject, traditionally the masculine subject, had constructed the world and interpreted the world according to a single perspective' (see Subject, postmodern critique of the§2). The second stage, in which one might include *Sexes and Genealogies*, was one in which she defined 'a second subject', that of a 'feminine subjectivity'. The third phase, represented by*Je, tu, nous* (1990) (*Je, Tu, Nous: Toward a Culture of Difference*, 1993), is one in which she constructs 'an intersubjectivity respecting sexual difference'. Here I shall focus on the first phase of Irigaray's tripartite division, as the most overtly philosophical period of her work, noting only that the third phase contains some more accessible works such as *Je, tu, nous*. It is also the period during which Irigaray began to receive a more sympathetic hearing from critics, who in the 1980s tended to dismiss her, with Julia Kristeva, as an essentialist.

2 'Luce' and 'Irigaray'

Luce Irigaray prefers to be referred to by her given name, Luce, as well as her paternal name, Irigaray. This preference reflects several fundamental issues with which her work is centrally concerned, the most obvious of which is a rejection of the primacy of the name of the father, and an insistence upon the distinction between femininity and masculinity. By insisting on the difference between her first name and her surname, Luce Irigaray draws attention to the act of naming and its presuppositions, and calls for a thoughtful relation to the language and traditions that we often unthinkingly inhabit. At the same time, she reclaims authority from the paternal law that

governs language, refusing to capitulate to the dictates of a system of representation that has repressed and marginalized women. In doing so, she recreates and transforms the significance that we usually assume in the process of naming, in a gesture that is both negative and positive. On the one hand Luce Irigaray challenges the traditional place of women as defined by mainstream Western society, and on the other she offers a new interpretation of women's roles. This double gesture opens the way for a third contribution, namely the re-enactment of sexual difference as a relationship between men and women that is not governed by a privileging of masculinity.

3 *Speculum of the Other Woman*

In *Speculum*, Luce Irigaray provides close textual readings of philosophical figures ranging from Plato to Freud, and including Descartes, Hegel and Plotinus. In her own words, *Speculum* treats 'the problem of the Other as woman in Western culture'. In 1985, along with *This Sex Which is Not One*, the English translation of *Speculum* appeared, marking the beginning of what has proved to be a turbulent relationship between Luce Irigaray and her critics. One reason for the controversial reception her work has elicited from English-speaking readers is the difficulties her writing - which is full of word play - poses for translators. By the word 'speculum' Luce Irigaray intended an allusion not only to 'the mirror in a simple sense', in which 'one sees oneself', but also to works that speak of '"*speculum mundi*" - that is, the "mirror of the world"'. Thus, says Luce Irigaray, at issue is how 'it's possible to give an account of the world within a discourse'.

The problems of translation that Luce Irigaray's work precipitates are not limited to her sometimes elliptical allusions. The translation of *Speculum: de l'autre femme* as *Speculum of the Other Woman* led to the assumption, says Luce Irigaray, that she was concerned with 'the image of the other woman', or with 'an empirical relation between two women, for example. This is absolutely not the project of *Speculum*.… it should have been put, *Speculum* on *the Other Woman* or *On the Other: Woman*. That would have been best' (Hirsh and Olson 1995).

By documenting the ways in which diverse texts of the Western philosophical tradition adhered to a systematic representation of women as other, Luce Irigaray demonstrated the sense in which the tradition achieved a certain unity and coherence on the basis of that which it excluded: women. Disparate in other respects, the philosophers she explores in *Speculum* share in common their dismissal, neglect and denigration of women.

Deploying a strategy of mimicry, imitating the methods of the very texts she examines, Luce Irigaray exhumes what remains of women, once the tradition has had its say, putting together the disparate parts, the shattered remnants, in order to create for the first time an image of women that goes beyond the mirroring function they have served in order to 'constitute a masculine subject' and knowledge.

Thus, for example, she retrieves the tragic and mythical figure of Antigone from the hands of Hegel ([1807] 1952) not by repudiating from the start the Hegelian analysis of this Sophoclean heroine, but precisely by taking his analysis to its limits, pushing the boundaries of his own presuppositions until they pass into their opposite, and yielding conclusions that contradict Hegel's own premises. Thus Hegel, the master of dialectic, is dialectically forced to say what he both says and cannot say: that women are 'the eternal irony of the community', and that their disruption of the ethical system of the state is to be celebrated and desired, rather than contained and repressed. Luce Irigaray thus sublates the conclusions of his absolute knowledge. She perfects and masters Hegel's own methods, even as she undermines and erases their results.

Antigone represents for Hegel the purest tragic figure, but she is not conscious of the meaning of her own deed. Hegel will grant Antigone only an immediate and intuitive understanding of ethical action, denying her the ability to reflect rationally on the significance of her action in the state as a whole. He thereby privileges the community over the individual, rationality over intuition, and abstract political duty over the exigencies of body, blood, and kinship. He upholds Creon's male claim to represent the *polis*, over Antigone's female adherence to the only tasks that ancient Thebes allows her as a woman - the care of the body and allegiance to family. Insisting on performing the rites of burial for her traitorous brother, Antigone will care for her family members in death, as in life. But whereas Hegel, along with Creon, upbraids her for this, Luce Irigaray rejoices in her refusal to obey an edict that forbids her to do the only task that is truly hers as a woman - banned from public life as her sex is.

4 Lips that speak together

Luce Irigaray is best known for the image that she presents in her essay 'When Our Lips Speak Together' (in *Ce sexe qui n'en est pas un*, 1977). Read as an ironic counterpart to Lacan's 'phallus', Luce Irigaray's view of the subject is what one critic calls 'lipcentric', but in a way that seeks to uncover multiple 'phalluses' rather than make any foundational or univocal claims for its own privilege. Luce Irigaray's work creates a 'feminine imaginary' to counteract that of the dominant culture, a masculine imaginary. A feminine or female imaginary can be understood both as the shards or fragments that remain of woman in the Western philosophical unconscious, and the creative space that these open for future re-mapping of women's identification. Luce Irigaray's texts flout academic conventions, insisting on a plurality of meanings, and blurring the boundaries separating commentary from the original texts she interprets, in order to make the point that the authority of the canon often derives from a source of unacknowledged sustenance, namely the work of women.

TINA CHANTER

List of works

Irigaray, L. (1974) *Speculum de l'autre femme*, Paris: Éditions de Minuit; trans. G.C. Gill, *Speculum of the Other Woman*, Ithaca, NY: Cornell University Press, 1985. (Exposes the phallogocentric mythology pervading philosophical texts of the Western tradition from Plato to Freud.)

Irigaray, L. (1977) *Ce sexe qui n'en est pas un*, Paris: Éditions de Minuit; trans. C. Porter with C. Burke, *This Sex Which is Not One*, Ithaca, NY: Cornell University Press, 1985.(A collection of essays and interviews expounding the ways in which women have functioned as objects of exchange among a male economy, as the unacknowledged resource that supports a phallic symbolic, and suggesting an alternative view of interaction both among women and between women and men.)

Irigaray, L. (1980) *Amante marine. De Friedrich Nietzsche*, Paris: Éditions de Minuit; trans. G. Gill, *Marine Lover of Friedrich Nietzsche*, New York: Columbia University Press, 1991.(A study of the ways in which Nietzsche's work operates by excluding one of the four elements, water.)

Irigaray, L. (1982) *Passions élémentaires*, Paris: Éditions de Minuit; trans. J. Collie and J. Still, *Elemental Passions*, New York: Routledge, 1992.(A poetic meditation on the role of earth, air, fire and water, emphasizing the fluidity of these categories.)

Isaac of Stella (d. *c*.1177)

Like other twelfth-century Cistercians, Isaac of Stella was well versed in secular learning. Centrally engaged with the contemplative life, he expresses his spiritual insights in terms of the science of his day, and combines a spiritual psychology derived from Johannes Scottus Eriugena and Hugh and Richard of St Victor with an anthropology grounded in Stoic physics, Greek and Arab medicine, and a cosmic model derived from Plato's Timaeus. A unifying theme of his writings is the relation between the physical and spiritual dimensions of human experience.

Born in England in the early twelfth century, Isaac studied in France. Though he speaks of the boldness and brilliance of his teachers, he mentions no names, but his writings reveal the influence of Thierry of Chartres, Gilbert of Poitiers and William of Conches, and indicate a solid grounding in the liberal arts and the writings of secular authors. He was also throughly versed in the Augustinian tradition represented by Hugh of St Victor (see Augustinianism), and in Greek patristic thought as transmitted by Eriugena. He had presumably been a monk for some time when, in 1147, he became abbot of the monastery of l'Étoile (Latin *Stella*), near Poitiers, which had recently been joined to the Cistercian Order. After twenty years during which he helped to found further Cistercian houses, and apparently aided Thomas Becket in his exile from England in the mid-1160s, Isaac removed, probably in 1167, to the island of Ré near La Rochelle. Here he assisted in founding a new monastery, Notre-Dame des Chateliers, where he evidently remained until his death around 1177.

Isaac's secular training appears plainly in his sermons, which are in effect brief theological essays dealing, frequently in technical language, with human nature, the relation of God to the universe, the Trinity and the stages of the soul's ascent to God. The distinctive features of his thought are synthesized in his *Epistola de anima (Letter on the Soul)*, a short treatise which considers the soul as an intermediary between the material world and the divine. Like Plato in the *Timaeus*, Isaac develops the idea that human nature in its complexity mirrors the universe at large, but a human being is more than a 'lesser universe', for the human soul has the power to comprehend its cosmic environment and consider it in relation to the divine Wisdom it manifests. The soul is the eye of the cosmic body, and at the same time bears a unique relation to God. Its three fundamental faculties, the rational, concupiscible and irascible (*rationabilitas*, *concupiscibilitas*, *irascibilitas*), correspond to the Persons of the Trinity conceived as Wisdom, Love and Power.

Set between God and the material world, the soul, sustained and inspired by divine grace, has the capacity to resolve the opposition between body and spirit. *Rationabilitas*, in which the soul resembles the divine Wisdom, and *conscupiscibilitas*, which emulates the all-embracing love of the Holy Spirit, reach out to the created world by means of the senses, whose perceptions are adapted to spiritual understanding by reason and imagination. When intimately engaged with the material world, the soul's imagining power (*phantasticum animae*) conceives images that are 'almost bodily', while sensory imagination for its part can form images of an 'almost spiritual' purity. At this level, Isaac declares, drawing on the Stoic concept of a 'fiery' power which informs physical and mental activity at all levels (see Stoicism), bodily and spiritual perception can collaborate, 'joined in a personal union without confusion of nature'. This linkage, through which material reality becomes accessible to the divine faculties of the soul, is analogous to the relationship whereby the soul itself bears the likeness of God and has the capacity to be 'taken up even into personal oneness' with him. From this analogy, Isaac proceeds to consider other ways in which the 'likeness' between physical and spiritual allows perception to transcend the limits of bodily existence by bringing all levels of our nature into collaboration with 'the gift of creating grace'.

Though the circulation of Isaac's writings seems to have been limited, the *Letter on the Soul* had a considerable influence through its contribution to the widely circulated treatise *On the Spirit and the Soul*. This compilation, wholly unoriginal and occasionally confused, nonetheless exercised a wide influence, partly because of its attribution to Augustine, and brought elements of Isaac's spiritual psychology to bear on the *summae* of the thirteenth-century pioneers of systematic theology, as well as the contemplative writers of the later Middle Ages.

Islam, concept of philosophy in

There is no generally accepted definition of what Islamic philosophy is, and the term will be used here to mean the sort of philosophy which arose within the culture of Islam. There are several main strands to Islamic philosophy. Peripatetic philosophy follows broadly the Greek tradition, while Sufism uses the principle of mystical knowledge as its leading idea. Some would argue that Islamic philosophy has never lost its concentration on the Qur'an and other significant Muslim texts, and that throughout its history it has sought to understand the essence of the realities both of the Sacred Book and of the created world. The decline of Peripatetic philosophy in the Islamic world did not mean the decline of philosophy as such, which continued to flourish and develop in other forms. Although it is sometimes argued that philosophy is not a proper activity for Muslims, since they already have a perfect guide to action and knowledge in the Qur'an, there are good reasons for thinking that Islamic philosophy is not intrinsically objectionable on religious grounds.

1 Nature and origins of Islamic philosophy

One of the interesting features of Islamic philosophy is that there is controversy as to what it actually is. Is it primarily the sort of philosophy produced by Muslims? This is unsatisfactory, since many Muslims who work as philosophers do not deal with Islamic issues in their philosophical work. Also, there are plenty of philosophers who are not Muslims and yet whose work is clearly in the area of Islamic philosophy. Could we call 'Islamic philosophy' philosophy which is written in Arabic? Certainly not, since a great deal of Islamic philosophy, perhaps the majority of it, is written in other languages, in particular Persian. Is Islamic philosophy then philosophy which examines the conceptual features of specifically Islamic issues? Not necessarily, since there are many thinkers whose work on logic and grammar, for example, is part of Islamic philosophy, even though there is no direct religious relevance in their work. Some commentators have tried to develop a central agenda which everyone who can be called an Islamic philosopher must share; they then have the difficulty of fitting everything in Islamic philosophy into that framework, a task which ultimately tends to fail (Leaman 1980). Perhaps the best way of specifying the nature of Islamic philosophy is to say that it is the tradition of philosophy which arose out of Islamic culture, with the latter term understood in its widest sense.

When did Islamic philosophy start? This is also a difficult question to answer, since from the early years of Islam a whole variety of legal and theological problems arose which are clearly philosophical, or at least use philosophical arguments in their elucidation. For example, there were heated debates about the acceptability of anthropomorphic language to describe the deity, and about the roles of free will and determination in the lives of human beings. Philosophy in its fullest sense began in the third century of the *hijra*. (The *hijra* was in 622 AD, when the Prophet Muhammad moved to Medina and set up a political community there; it is the first year according to the Muslim calendar, represented as AH 1.) The supremacy of the Abbasids over the Umayyads had led to an eastward movement of the Islamic empire, with the capital moving from Damascus to Baghdad. By this time also, Islam dominated such areas as Egypt, Syria and Persia, all places which were thoroughly immersed in Greek culture. The new rulers sought to apply the learning which existed in the empire to their own purposes. Much of this knowledge was very practical, being based on medicine, astrology, astronomy, mathematics and engineering. The caliph al-Ma'mun founded in Baghdad the *bayt al-hikma*, the House of Wisdom, in AH 217/AD 832, which served as an observatory and, more importantly, as a library and centre for the translation of Greek texts into Arabic. Many of the translators were Christians, who translated texts first from Greek into Syriac and then into Arabic (see Greek philosophy: impact on Islamic philosophy). In addition to the influence of the many translations of Greek texts, there was also an important transmission of Indian and Persian literature into Arabic, which undoubtedly had an influence on the development of Islamic philosophy.

It should not be thought that these translations were uncontroversial. Many Muslims questioned the necessity for Muslims to study philosophy at all. After all, Islam presents a complete practical and theoretical model of the nature of reality, and the 'first sciences' of the Greeks often seemed unnecessary and even opposed to Islam. Muslims had not only the Qur'an to help them regulate their lives and theoretical queries, they had also the *hadith*, the traditional sayings of the Prophet and the righteous caliphs (his immediate successors and companions) and the *sunna*, the practices of the community. There was further the system of *fiqh*, Islamic law, which discussed particular problems concerning how Muslims ought to behave, and the science of grammar, which explained how

the Arabic language ought to be understood. There was also by this time a well-developed system of *kalam*, theology, which dealt with the less obvious passages of the Qur'an, and which sought conceptual unity in apparent difficulties arising from the combinations of different canonical texts (see Islamic theology). What need was there then for the sort of philosophy which existed in Greek, which originated with non-Muslims and was initially transmitted into Arabic by non-Muslims?

This would not have been such a heated issue had philosophy not seemed to be so antagonistic to Islam on so many points. The philosophy that was transmitted into Arabic at this time was profoundly Neoplatonic (see Neoplatonism in Islamic philosophy); it tended to agree with Aristotle (§16) that the world is eternal, that there is a hierarchy of being with the intellect at the summit and the world of generation and corruption at the bottom, and recommended a rather ascetic system of ethics (see Neoplatonism §3). Even more crucial was the criterion of validity which the philosophers used. This was based on reason, as opposed to revelation, and naturally brought into question the significance of religious revelation. Thus philosophy came to be seen not so much as an alternative formulation of religious truths but as a rival and competing system of thought, one which required opposition by Islam. Those Muslims who worked as philosophers had to justify themselves, and they did so in a number of ways.

The first philosopher of the Arabs, al-Kindi, tended to argue that there is no basic inconsistency between Islam and philosophy, just as there is no basic inconsistency between Plato and Aristotle. Philosophy helps the Muslim to understand the truth using different techniques from those directly provided through Islam. Once philosophy became better established, however, it managed to sever the link with religion altogether, as we can see from al-Farabi onwards. Religion is then taken to represent the route to truth available to the unsophisticated and simple believer; when compared to philosophy it is seen as a version of the truth, albeit perhaps of poorer conceptual quality. The most determined defender of this view is undoubtedly Ibn Rushd (Averroes), with whom this form of philosophy largely came to an end in the sixth century AH (twelfth century AD).

2 *Falsafa* and *hikma*

Peripatetic philosophy in the Islamic world came to have considerable importance for a fairly limited period, from the third to sixth centuries AH (ninth to twelfth centuries AD). Sometimes the distinctness of this form of reasoning from traditional Islamic methodologies was emphasised by the use of the term *falsafa*, an Arabic neologism designed to represent the Greek *philosophia*. Often, however, the familiar Arabic term *hikma* was used. *Hikma* means 'wisdom', and has a much wider meaning than *falsafa*. A good deal of *kalam* (theology) would be classed as *hikma*, as would mysticism or Sufism (see Mystical philosophy in Islam §1). Whereas much *falsafa* is defined as the knowledge of existents, wider conceptions of the discipline tend to use the term *hikma*. Al-Suhrawardi, the creator of illuminationist philosophy, called it *hikmat al-ishraq*, a title which was taken up later by Mulla Sadra, and which is often translated in English as theosophy (see Illuminationist philosophy; Theosophy). This sort of philosophy involves study of reality which transforms the soul and is never really separated from spiritual purity and religious sanctity.

Philosophy as *hikma* has the advantage of referring to a wide range of conceptual issues within Islam. Philosophy can then deal both with the exoteric aspects of the Qur'anic revelation and the esoteric dimensions which lie at the heart of religion. Both the Qur'an and the universe are often viewed as aspects of divine revelation which require interpretation, and philosophy in its widest sense has a vital role here. Western commentators have tended to overemphasize the Greek background of Islamic philosophy, yet most of the major Islamic philosophers wrote extensively on the Qur'an and saw the role of philosophy as lying chiefly in the hermeneutic investigation of holy texts. This is particularly the case with the philosophers in Persia and India, who continued the philosophical tradition after it largely came to an end in its Peripatetic form. Islamic philosophy is then essentially 'prophetic philosophy', since it is based on the interpretation of a sacred text which is the result of revelation. It deals with human beings and their entelechy, with the One or Pure Being, and the grades of the universal hierarchy, with the universe and the final return of all things to God. An important aspect of this view is that it sees Islamic philosophy not as a transitory phenomenon but as a continuing tradition in the Islamic world, not as something largely imported from an alien culture but as an essential aspect of Islamic civilization.

A good example of this wider notion of philosophy lies in the controversy over the 'oriental philosophy' (*al-hikmat al-mashriqiyya*) of Ibn Sina (Avicenna). Ibn Sina is well known as a creator of a Peripatetic

philosophical system, one which came to have considerable significance within both Islamic and Western philosophy. His book *Mantiq al-mashriqiyyin (Logic of the Orientals)* deals largely with logical differences between him and Aristotle, but also includes a reference to other of his own works in which he claims to have gone in an entirely different direction from that of the Peripatetic (*mashsha'i*) thinkers. This book is not extant; perhaps the *Mantiq* is the first part of it. From what we find in his surviving works, a picture of the 'oriental philosophy' can be constructed. The Aristotelian universe becomes transformed, reason is linked to the intellect, the external universe becomes interiorized, facts become symbols and philosophy itself becomes a type of gnosis or *sophia*. The aim of philosophy is not only the theoretical knowledge of the substances and accidents of the universe, but also the experience of their presence and instantiation in such a way as to enable the soul to free itself from the confines of the universe. The universe is experienced not as something external to be understood but rather as a succession of stages along a path on which one is travelling. The notion of this 'oriental philosophy' has played an important part in the development of future illuminationist and Sufi forms of philosophy which not only seek to understand the universe rationally but also analyse the wonder we feel when we contemplate the divine mystery of that universe.

An advantage of seeing Islamic philosophy as broadly *hikma* rather than as the more narrow *falsafa* is that it avoids the danger of regarding it as predominantly an unoriginal and transmitted form of thought. This has often been the form of interpretation favoured by Western commentators, who are interested in seeing how originally Greek (and sometimes Indian and Persian) ideas reach the Islamic world and then form part of alternative systems of philosophy. There is no doubt that an important part of Islamic philosophy does follow this path, and the study of it is perhaps more appropriately a part of the history of ideas than of philosophy. Yet it should not be forgotten that by far the larger part of Islamic philosophy does not deal with the concerns of Peripatetic philosophy as such, but is firmly directed to the issues which arise within the context of an Islamic perspective on the nature of reality. Peripatetic philosophy, *falsafa*, may well enter this process, but it is far from the uncritical application of Greek ideas to Islamic issues. Although the central principles of *falsafa* have their origin in Greek philosophy, they were so radically transformed and developed within Islamic philosophy that there is no justification in thinking that the latter is merely a result of the transmission of ideas from outside Islam.

3 Heresy and the decline of Peripatetic philosophy

A highly influential attack on the role of philosophy as part of Islam was carried out by al-Ghazali in his *Tahafut al-falasifa (The Incoherence of the Philosophers)*. According to al-Ghazali, the Peripatetic philosophers (he was thinking in particular ofIbn Sina) present as truths theses which are often either heretical (*kufr*) or innovatory (*bid'a*). One might have expected him to go on to argue that these philosophical theses are therefore unacceptable on those grounds alone, but he does not do so. Instead, al-Ghazali criticizes these theses because, he argues, they do not follow from the arguments which the philosophers themselves give. These arguments are philosophically weak, and so need not be accepted. It is a happy consequence of the failure of these arguments that the principles of Islam are seen to rest on solid rational principles, at least in the sense that their contraries are untrue. Although al-Ghazali is often regarded as the archenemy of philosophy, it is evident on closer inspection of many of his texts that he himself seems to adhere to many of the leading principles of Ibn Sina's thought. Also, in common with many other opponents of philosophy, he had a high regard for logic (which was regarded as a tool of philosophy rather than a part of it) and insisted on the application of logic to organized thought about religion. Some opponents of philosophy such as Ibn Taymiyya even went so far as to criticize logic itself, but on the whole as the Peripatetic tradition of philosophy declined in the Sunni Islamic world it nonetheless entered other areas of Islamic life, such as theology and jurisprudence, and continued to have an influence until it was revived within the last century as part of the Islamic renaissance (*nahda*) (see Islamic philosophy, modern §1).

Philosophy persisted in the Shi'i world far more easily, and there has been a continuing tradition of respect for philosophy in Persia and other Shi'i communities up to today. Sunni Muslims tend to accept that the door to *ijtihad* (independent judgment) is now closed, and we must seek resolution of any theoretical and practical difficulties by referring to a series of canonical texts and to the consensus of the community. Shi'i Muslims appeal also to the authority of the imams, and especially in the case of some Shi'is to the 'hidden' or twelfth imam, as being in the continuing line of religious descent from the Prophet and from his son-in-law Imam 'Ali. Since the bases of religious authority are more fluid for the *shi'a*, it tends to be more receptive to philosophy than is the case with the Sunnis. The legal definitions of what constitutes heresy and unbelief are sometimes much looser (as with the

Isma'ilis, for example), and the openness to a diversity of ideas and approaches has marked many Shi'i communities and countries. While Peripatetic philosophy went into a sharp decline in the Sunni world after the sixth century AH/twelfth century AD, it continued as part of a variety of philosophical approaches in the Shi'i world, either on its own or combined with elements of illuminationist (*ishraqi*) philosophy, and developed into more and more complex theoretical systems. Of course, philosophy continued to flourish in both the Sunni and Shi'i worlds in the sense of mystical philosophy or Sufism, which has been a persistent aspect of Islamic philosophy throughout its life.

4 Reason and revelation

Many Western commentators on Islamic philosophy take the conflict between reason and revelation as its central issue. This is often symbolized as the struggle between Athens and Jerusalem, or between philosophy and religion. While this is far too crude to be an accurate description, it does raise an important issue which has been discussed ever since Islamic philosophy began and which is still a live issue today in the Islamic world. If revelation tells believers everything they need to know, why bother to explore the same topics with reason? There are a number of answers to this question. First of all, the Qur'an itself speaks not only to Muslims, but to everyone who is able to read and understand it. It constantly urges the reader to consider rationally the evidences for Islam, and so places a high value on reason (Leaman 1985). This is not to suggest that there is no role for faith, nor that faith will not be necessary at some stage in order to approach God, but the Qur'an does offer rational indications of the truth of what it is advocating in terms of signs and proofs. This is certainly not an argument for free enquiry in the modern sense of the term, but it is an approach which places high value on the notion of independent reason, which might be seen as sympathetic also to the practice of philosophy itself.

According to Islam, the Prophet Muhammad is the last prophet. This implies that from that time on, no messenger can claim divine authority. We are reliant upon the correct interpretation of the *ayat* (signs) in both the Qur'an and in the universe. The ending of prophecy means that God expects human beings to use their reason to seek to understand the nature of reality, albeit reason which is guided by the principles of Islam. As the Qu'ran has it, 'We will show them our signs in all the parts of the earth and in their own souls, until they clearly see what is true' (Surah 41: 53). It is not as though there is competition between prophecy and philosophy, since the latter should be seen as supplementing and explaining the former. There are good grounds, then, for thinking that there is no basic incompatibility between the pursuit of reason and the pursuit of religion, at least not in Islam.

Islamic fundamentalism

The philosophical roots of Islamic fundamentalism are largely the result of a conscious attempt to revive and restate the theoretical relevance of Islam in the modern world. The writings of three twentieth-century Muslim thinkers and activists - Sayyid Qutb, Ayatollah Ruhollah al-Khumayni and Abu al-'Ala al-Mawdudi - provide authoritative guidelines delineating the philosophical discourse of Islamic fundamentalism. However, whereas al-Khumayni and al-Mawdudi made original contributions towards formulating a new Islamic political theory, it was Qutb who offered a coherent exposition of Islam as a philosophical system.

Qutb's philosophical system postulated a qualitative contradiction between Western culture and the religion of Islam. Its emphasis on Islam as a sui generis *and transcendental set of beliefs excluded the validity of all other values and concepts. It also marked the differences between the doctrinal foundations of Islam and modern philosophical currents. Consequently Islamic fundamentalism is opposed to the Enlightenment, secularism, democracy, nationalism, Marxism and relativism. Its most original contribution resides in the formulation of the concept of God's sovereignty or lordship. This concept is the keystone of its philosophical structure.*

The premises of Islamic fundamentalism are rooted in an essentialist world view whereby innate qualities and attributes apply to individuals and human societies, irrespective of time, historical change or political circumstances. Hence, an immutable substance governs human existence and determines its outward movement.

1 Essentialism and dualism

Paganism (*jahiliyya*) is the generic designation given to all systems of thought other than Islam, both ancient and modern. According to Islamic fundamentalism, since the dawn of history human society has been a battleground between belief and unbelief, right and wrong, religious faith and idolatry. Individuals and their beliefs may carry different names in different ages, but this duality remains essentially the same.

The definition of paganism is thus stretched to encompass Greek philosophy in the ancient world as well as utilitarianism and existentialism in the modern age. To Sayyid Qutb, for example, paganism is deemed to be present wherever 'people's hearts are devoid of a divine doctrine that governs their thought and concomitant legal rules to regulate their lives' (Qutb 1982: 510). Moreover, although outward manifestations may differ from age to age, the nature and attributes of paganism remain permanent. On the other hand, religion operates throughout the ages within constant perimeters, rotating around a fixed axis. Furthermore, religion and the cosmic order reflect God's will in its harmonious design (see Cosmology).

In this scheme of things, human nature and the cosmos are substances which retain their identities while undergoing change. A substance generates properties and assigns them a function peculiar to their qualities. Properties inhere in substances and are dependent for their existence and persistence on them. Such properties are not incidental, but form an identifiable structure quite distinct from other structures. These properties are therefore not transferable, in that once transferred they lose their function or significance (see Substance).

According to Islamic fundamentalism, the essential nature of human beings is religious and atheism is an aberration. Throughout human history there have been only two methods of organizing human life: one that declares God to be the sole sovereign and source of legislation, and another that rejects God, either as a force in the universe or as the lord and administrator of society. These two methods are irreconcilable: the first denotes Islam, the second paganism. Once human beings accept legislation to be dependent on the will of an individual, a minority or a majority, and not as the prerogative of God alone, they lapse into a type of paganism, be it a dictatorship, capitalism, theocracy or communism.

However, human history is an emanation of a doctrinal concept that is implanted by God in human beings in their capacity as his designated lieutenants on this earth. The lieutenancy (*khilafa*) of a human being is to carry out the commands of God. According to this line of reasoning, most human societies in the twentieth century resemble in their way of life the state of affairs that existed before the rise of Islam. In order to re-establish Islam as a system of government, it is thus of primary importance to discover anew the fundamental constituents of its doctrine. Such an honourable task falls to a well-disciplined group of believers. These pioneers, dubbed 'the vanguard' by Qutb, 'the Revolutionary Party' by Abu al-'Ala al-Mawdudi and 'the holy warriors' by Ayatollah Ruhollah

al-Khumayni, are called upon to undertake the reinstatement of Islam in both its doctrinal and political dimensions. The method of struggle is often referred to as *jihad*, or holy war launched in the path of God.

2 The fundamental principles of Islam

The fundamental principles of Islam and the injunctions of its laws are one seamless garment woven by God for his creatures. Whereas Greek thought, particularly Aristotelian thought, asserted that we are political animals by nature, Islamic fundamentalism contends that the basic instinct of human beings is intrinsically religious. Religion is understood in this context to be Islam itself (see Islamic theology).

Islam has its own constant, immutable and clearly defined nature. Its underlying aim is to change the process of history and create a new human being, unfettered by subservience to other human beings or institutions. To be a Muslim is to believe in the fundamental principles of Islam in their entirety. Moreover, the doctrinal principles of Islam are not to be studied theologically, metaphysically or philosophically. Their study is primarily a practical endeavour aimed at discovering the base on which an all-embracing system is to be erected for the benefit of humanity. Theory and praxis go hand in hand; knowledge is simply a prelude to social action and political engagement.

For Qutb, al-Mawdudi and al-Khumayni, the doctrine of Islam forms an organic unity. A description of its constituent parts is therefore a mere analytical device, which should under all circumstances indicate the interdependence and complementarity of these parts. Once a part is detached and treated on its own it loses its significance, depriving the harmonious totality of its beauty and truth. The true nature of divinity, for example, cannot be understood apart from its direct efficacy in regulating the movement of the universe and in all its physical and spiritual connotations. Thus God’s divinity ensures the harmonious essence of cosmic laws: God sustains, guards and regulates the universe according to fixed laws. Nevertheless, his absolute will fashions every movement or event without being bound by them. These laws are not self-regulatory in that they persist as a result of the immediate act of God, and are thus created anew every moment. The world was created in time, a fact denoting a temporal beginning rather than an eternal existence.

In classical Islam, God’s attributes were enumerated and discussed by a number of theologians and philosophers, but his essence was deemed to lie beyond human knowledge. Islamic fundamentalism, as represented by Qutb’s system, shifted the debate to Islam’s essence and attributes. Hence the fundamental principles of Islam were considered by Qutb to consist in their delineation of God’s divinity as well as human servitude in carrying out the tenets of the message as handed down to the seal of the prophets, Muhammad. These fundamentals spell out God’s divinity (*uluhiyya*) and the servitude of animate and inanimate objects to God (*‘ubudiyya*), in addition to the true essence of the cosmos, life and humanity (see God, concepts of). Moreover, the visible and invisible worlds are both an integral part of this doctrine and should be present in treating the vicissitudes of human existence.

These fundamentals are not the result of an exertion by the human mind. Rather, the human mind receives them in their entirety once it is freed of its *a priori* conceptions. One does so by adhering to the sound linguistic or conventional meaning of the text in which such principles are propounded. The human mind has no function other than to understand the exact meaning of the text, irrespective of its conformity to the axioms of reason. Hence, one must accept the existence of angels, *jinns*, resurrection, hell and paradise without equivocation.

According to Qutb, the principle of divinity is the primary and most efficacious essence in the formation of the Islamic doctrine. The existence of such an essence, being absolute and eternal, does not stand in need of external evidence. The innate nature of human beings recognizes this existence, unless it is encumbered by corrupt beliefs that render it incapable of receiving this single fact. Furthermore, the methodology of the Qur’an itself is not concerned with affirming the existence of divine power. Rather, it concentrates on describing its true quality in order to rectify the distorted views of other creeds. This rectification is not confined to distortions which prevailed before the rise of Islam; its scope covers all deviant beliefs down to the present. It thus shows the aberrance or the negativity of Aristotle’s God (see Aristotle §16), that of Plato’s Forms and their adoption in Schopenhauer’s unconscious will (see Plato; Schopenhauer, A.), and the series of emanations elaborated by Plotinus and taken over by so-called Islamic philosophy (see Neoplatonism in Islamic philosophy). It also rectifies the dualism of Descartes as well as Bergson’s vital power (see Bergson, H.-L. §7), in addition to the materialism of Parmenides in the ancient world and that of Karl Marx in our modern period (see Materialism). The Qur’anic methodology is first

and foremost concerned with the question of monotheism rather than existence (see Monotheism). Its main aim is to show the simple, indivisible and unique essence of God; it also asserts the attributes of God in their utter uniqueness and splendour.

3 Islam's attributes

Whereas orthodox Islamic philosophy and theology (*'ilm al-kalam*) were largely concerned with defining and elaborating God's attributes, Islamic fundamentalism shifted its focus to the attributes of Islam itself. In other words, Islam became a substantive quality with certain characteristics which could rival in their structures and functions other modern ideologies, such as fascism and Marxism. This is not to say that the divine attributes were ignored, but their significance was made a function of the predicative characteristics of a new Islamic theory.

It is well known that in mainstream Islamic theology, as propounded in the tenth century AD by Abu al-Hasan al-Ash'ari, only those attributes denoting God's acts are considered to lie within human knowledge (see Islamic theology §§2-3; Ash'ariyya and Mu'tazila §1). These acts were held by al-Ash'ari to be seven in number. It is in this context that Qutb's doctrinal work, *Khasa'is al-tasawwur al-islami (The Characteristics of the Islamic Conception)*, gains in significance. Although Qutb contended that Islamic theology and philosophy were outdated modes of knowledge, tainted by their reliance on categories derived from classical Greek thought, he aspired to inaugurate a new Islamic vision using an amalgamation of ancient and modern ideas. He claimed, for example, that his new interpretation consisted of a direct act of understanding the Qur'an. This receptivity is said to be unmediated and based on an immediate grasp of Qur'anic verses.

However, Qutb's binary division of Islam into 'characteristics' and 'fundamentals' is reminiscent of orthodox debates on the essence and attributes of God. It is also worth mentioning that in enumerating the characteristics of Islam, Qutb devised a new list which nevertheless, in a manner reminiscent of al-Ash'ari, included seven attributes: lordship, constancy, comprehensiveness, balance, positivity, realism and absolute unity or monotheism. These attributes of Islam emanate from God's will and specify certain rules and modes of behaviour incumbent on all believers.

4 Knowledge, causation and faith

In Islamic fundamentalism, the affinity between philosophy and natural science, an axiom of classical and medieval thought (see Natural philosophy, medieval), is ruptured and deemed to be unwarranted. Scientific knowledge is then confined to technical details and superficial alterations, a fact that renders its concepts temporary, relative and liable to change. Science is linked with experimental knowledge rather than the discovery of underlying principles.

Islam continues to be credited with stimulating the promotion of experimental methodologies that were appropriated by European scholars after the Renaissance. Nevertheless, Islamic fundamentalism, while placing the Qur'an outside the scope of modern science and philosophical debates, persists in alluding to the shortcomings of Western theories and trends of thought. Qutb, for example, highlights the fact that life itself is not inherent in the nature of matter or the universe (see Life, origin of); rather, it was infused by God into dead substances. This statement allows him to refute Darwin's theory of evolution in so far as it leaves aside supernatural factors in explaining the emergence of living beings (See Darwin, C.R.). He also calls Karl Marx's interpretation of social progress by means of purely economic laws an arbitrary idea; so also is Bergson's concept of life as a willed or vital creation (see Marx, K. §8; Bergson, H-L. §7).

While Islamic fundamentalism rejects the atomist theory of orthodox Muslim theologians, it retains the idea of God as the real cause of events (see Islamic theology). Thus the connection between a cause and its effect is assumed to be the result of God's action. The metaphor used by al-Ghazali to show that combustibility, in the case of a flame coming into contact with a piece of cotton, has no other cause but God, is reiterated by Qutb. A piece of cotton is not set alight because of an act performed by a flame, but as a result of God's will to render the piece of cotton combustible. Moreover, God may decide to suspend the common course of nature, and miracles occur as an indication of the divine interruption of fixed laws. Such a miracle, Qutb points out, is mentioned in the Qur'an in relation to Abraham when a burning flame failed to set him alight. It is for this reason that the use of empirical evidence in order to demonstrate causality becomes an arbitrary human construct.

Islamic philosophy

Islamic philosophy may be defined in a number of different ways, but the perspective taken here is that it represents the style of philosophy produced within the framework of Islamic culture. This description does not suggest that it is necessarily concerned with religious issues, nor even that it is exclusively produced by Muslims (see Islam, concept of philosophy in).

1 The early years of Islamic philosophy

Islamic philosophy is intimately connected with Greek philosophy, although this is a relationship which can be exaggerated. Theoretical questions were raised right from the beginning of Islam, questions which could to a certain extent be answered by reference to Islamic texts such as the Qur'an, the practices of the community and the traditional sayings of the Prophet and his Companions. On this initial basis a whole range of what came to be known as the Islamic sciences came to be produced, and these consisted largely of religious law, the Arabic language and forms of theology which represented differing understandings of Islam.

The early conquests of the Muslims brought them into close contact with centres of civilization heavily influenced by Christianity and Judaism, and also by Greek culture. Many rulers wished to understand and use the Greek forms of knowledge, some practical and some theoretical, and a large translation project started which saw official support for the assimilation of Greek culture (see Greek philosophy: impact on Islamic philosophy). This had a powerful impact upon all areas of Islamic philosophy. Neoplatonism definitely became the prevalent school of thought (see Neoplatonism in Islamic philosophy), following closely the curriculum of Greek (Peripatetic) philosophy which was initially transmitted to the Islamic world. This stressed agreement between Plato and Aristotle on a range of issues, and incorporated the work of some Neoplatonic authors. A leading group of Neoplatonic thinkers were the Ikhwan al-Safa' (Brethren of Purity), who presented an eclectic philosophy designed to facilitate spiritual liberation through philosophical perfection (see Ikhwan al-Safa'). However, there was also a development of Aristotelianism in Islamic philosophy, especially by those thinkers who were impressed by the logical and metaphysical thought of Aristotle, and Platonism was inspired by the personality of Socrates and the apparently more spiritual nature of Plato as compared with Aristotle (see Aristotelianism in Islamic philosophy; Platonism in Islamic philosophy). There were even thinkers who seem to have been influenced by Greek scepticism, which they turned largely against religion, and Ibn ar-Rawandi and Muhammad ibn Zakariyya' al-Razi presented a thoroughgoing critique of many of the leading supernatural ideas of Islam.

Al-Kindi is often called the first philosopher of the Arabs, and he followed a broadly Neoplatonic approach. One of the earliest of the philosophers in Baghdad was in fact a Christian, Yahya Ibn 'Adi, and his pupil al-Farabi created much of the agenda for the next four centuries of work. Al-Farabi argued that the works of Aristotle raise important issues for the understanding of the nature of the universe, in particular its origination. Aristotle suggested that the world is eternal, which seems to be in contradiction with the implication in the Qur'an that God created the world out of nothing. Al-Farabi used as his principle of creation the process of emanation, the idea that reality continually flows out of the source of perfection, so that the world was not created at a particular time. He also did an enormous amount of work on Greek logic, arguing that behind natural language lies logic, so that an understanding of the latter is a deeper and more significant achievement than a grasp of the former. This also seemed to threaten the significance of language, in particular the language - Arabic - in which God transmitted the Qur'an to the Prophet Muhammad. A large school of thinkers was strongly influenced by al-Farabi, including al-'Amiri, al-Sijistani and al-Tawhidi, and this surely played an important part in making his ideas and methodology so crucial for the following centuries of Islamic philosophy.

Ibn Sina went on to develop this form of thought in a much more creative way, and he presented a view of the universe as consisting of entirely necessitated events, with the exception of God (see Causality and necessity in Islamic thought). This led to a powerful reaction from al-Ghazali, who in his critique of Peripatetic philosophy argued that it was both incompatible with religion, and also invalid on its own principles. He managed to point to some of the major difficulties with the developments of Neoplatonism which had taken place in Islamic philosophy, and he argued that while philosophy should be rejected, logic as a conceptual tool should be retained. This view became very influential in much of the Islamic world, and philosophy came under a cloud until the

nineteenth century.

2 Philosophy in Spain and North Africa

A particularly rich blend of philosophy flourished in al-Andalus (the Islamic part of the Iberian penninsula), and in North Africa. Ibn Masarra defended a form of mysticism, and this type of thinking was important for both Ibn Tufayl and Ibn Bajja, for whom the contrast between the individual in society and the individual who primarily relates to God became very much of a theme. The argument was often that a higher level of understanding of reality can be attained by those prepared to develop their religious consciousness outside of the framework of traditional religion, a view which was supported and became part of a highly sophisticated account of the links between religion and reason as created by Ibn Rushd. He set out to defend philosophy strenuously from the attacks of al-Ghazali, and also to present a more Aristotelian account than had been managed by Ibn Sina. He argued that there are a variety of routes to God, all equally valid, and that the route which the philosopher can take is one based on the independent use of reason, while the ordinary member of society has to be satisfied with the sayings and obligations of religion. Ibn Sab‘in, by contrast, argued that Aristotelian philosophy and logic were useless in trying to understand reality since those ideas fail to mirror the basic unity which is implicit in reality, a unity which stems from the unity of God, and so we require an entirely new form of thinking which is adequate to the task of representing the oneness of the world. A thinker better known perhaps for his work on history and sociology than in philosophy is Ibn Khaldun, who was nonetheless a significant philosophical writer; he presents an excellent summary of preceding philosophical movements within the Islamic world, albeit from a conservative (Ash‘arite) point of view.

3 Mystical philosophy

Mystical philosophy in Islam represents a persistent tradition of working philosophically within the Islamic world (see Mystical philosophy in Islam). Some philosophers managed to combine mysticism with Peripatetic thought, while others saw mysticism as in opposition to Peripateticism. Al-Ghazali had great influence in making mysticism in its Sufi form respectable, but it is really other thinkers such as al-Suhrawardi and Ibn al-‘Arabi who produced actual systematic mystical thought. They created, albeit in different ways, accounts of how to do philosophy which accord with mystical approaches to reality, and which self-consciously go in opposite directions to Peripateticism. Ibn al-‘Arabi concentrated on analysing the different levels of reality and the links which exist between them, while al-Suhrawardi is the main progenitor of Illuminationist philosophy (see Illuminationist philosophy). This tries to replace Aristotelian logic and metaphysics with an alternative based on the relationship between light as the main principle of creation and knowledge, and that which is lit up - the rest of reality. This tradition has had many followers, including al-Tusi, Mulla Sadra, Mir Damad and al-Sabzawari, and has been popular in the Persian world right up to today. Shah Wali Allah extended this school of thought to the Indian subcontinent.

4 Islamic philosophy and the Islamic sciences

Islamic philosophy has always had a rather difficult relationship with the Islamic sciences, those techniques for answering theoretical questions which are closely linked with the religion of Islam, comprising law, theology, language and the study of the religious texts themselves. Many theologians such as Ibn Hazm, al-Juwayni and Fakhr al-Din al-Razi presented accounts of Islamic theology which argued for a particular theory of how to interpret religious texts (see Islamic theology). They tended to advocate a restricted approach to interpretation, rejecting the use of analogy and also the idea that philosophy is an objective system of enquiry which can be applied to anything at all. Most theologians were Ash‘arites (see Ash‘ariyya and Mu‘tazila), which meant that they were opposed to the idea that ethical and religious ideas could be objectively true. What makes such ideas true, the Ash‘arites argued, is that God says that they are true, and there are no other grounds for accepting them than this. This had a particularly strong influence on ethics (see Ethics in Islamic philosophy), where there was much debate between objectivists and subjectivists, with the latter arguing that an action is just if and only if God says that it is just. Many thinkers wrote about how to reconcile the social virtues, which involve being part of a community and following the rules of religion, with the intellectual virtues, which tend to involve a more solitary lifestyle. Ibn Miskawayh and Al-Tusi developed complex accounts of the apparent conflict between these different sets of virtues.

Political philosophy in Islam looked to Greek thinkers for ways of understanding the nature of the state, yet also

generally linked Platonic ideas of the state to Qur'anic notions, which is not difficult given the basically hierarchical nature of both types of account (see Political philosophy in classical Islam). Even thinkers attracted to Illuminationist philosophy such as al-Dawani wrote on political philosophy, arguing that the structure of the state should represent the material and spiritual aspects of the citizens. Through a strict differentiation of role in the state, and through leadership by those skilled in religious and philosophical knowledge, everyone would find an acceptable place in society and scope for spiritual perfection to an appropriate degree.

Particular problems arose in the discussions concerning the nature of the soul (see Soul in Islamic philosophy). According to the version of Aristotle which was generally used by the Islamic philosophers, the soul is an integral part of the person as its form, and once the individual dies the soul disappears also. This appears to contravene the notion of an afterlife which is so important a part of Islam. Even Platonic views of the soul seem to insist on its spirituality, as compared with the very physical accounts of the Islamic afterlife. Many of the philosophers tried to get around this by arguing that the religious language discussing the soul is only allegorical, and is intended to impress upon the community at large that there is a wider context within which their lives take place, which extends further than those lives themselves. They could argue in this way because of theories which presented a sophisticated view of different types of meaning that a statement may have in order to appeal to different audiences and carry out a number of different functions (see Meaning in Islamic philosophy). Only the philosopher really has the ability to understand this range of meanings, and those who work in the Islamic sciences do not know how to deal with these issues which come outside of their area of expertise. While those skilled in dealing with the law will know how to adjudicate between different legal judgements, we need an understanding of the philosophy of law in Islam if we are to have access to what might be called the deep structure of law itself (see Law, Islamic philosophy of). Similarly, although the Qur'an encourages its followers to discover facts about the world, it is through the philosophy of science that we can understand the theoretical principles which lie behind that physical reality (see Science in Islamic philosophy).

Many of the problems of religion versus philosophy arose in the area of aesthetics (see Aesthetics in Islamic philosophy). The rules of poetry which traditionally existed in the Arabic tradition came up against the application of Aristotle's *Poetics* to that poetry. One of the interesting aspects of Islamic aesthetics is that it treated poetry as a logical form, albeit of a very low demonstrative value, along the continuum of logical forms which lie behind all our language and practices. This is explained in studies of both epistemology and logic (see Epistemology in Islamic philosophy; Logic in Islamic philosophy). Logic came to play an enormous role in Islamic philosophy, and the idea that logic represents a basic set of techniques which lies behind what we think and what we do was felt to be very exciting and provocative. Many theologians who attacked philosophy were staunch defenders of logic as a tool for disputation, and Ibn Taymiyya is unusual in the strong critique which he provided of Aristotelian logic. He argued that the logic entails Aristotelian metaphysics, and so should be abandoned by anyone who wishes to avoid philosophical infection.

However, the general respect for logic provides the framework for the notion that there is a range of logical approaches which are available to different people, each of which is appropriate to different levels of society. For the theologian and the lawyer, for instance, dialectic is appropriate, since this works logically from generally accepted propositions to conclusions which are established as valid, but only within the limits set by those premises. This means that within the context of theology, for example, if we accept the truth of the Qur'an, then certain conclusions follow if we use the principles of theology; but if we do not accept the truth of the Qur'an, then the acceptability of those conclusions is dubious. Philosophers are distinguished from everyone else in that they are the only people who use entirely certain and universal premises, and so their conclusions have total universality as well as validity. When it comes to knowledge we find a similar contrast. Ordinary people can know something of what is around them and also of the spiritual nature of reality, but they are limited to the images and allegories of religion and the scope of their senses. Philosophers, by contrast, can attain much higher levels of knowledge through their application of logic and through their ability to perfect their understanding and establish contact with the principles which underlie the whole of reality.

5 Islamic philosophy in the modern world

After the death of Ibn Rushd, Islamic philosophy in the Peripatetic style went out of fashion in the Arab world, although the transmission of Islamic philosophy into Western Europe started at this time and had an important

influence upon the direction which medieval and Renaissance Europe was to take (see Averroism; Averroism, Jewish; Translators; Islamic philosophy: transmission into Western Europe). In the Persian-speaking world, Islamic philosophy has continued to follow a largely Illuminationist curriculum right up to today; but in the Arab world it fell into something of a decline, at least in its Peripatetic form, until the nineteenth century. Mystical philosophy, by contrast, continued to flourish, although no thinkers matched the creativity of Ibn al-'Arabi or Ibn Sab'in. Al-Afghani and Muhammad 'Abduh sought to find rational principles which would establish a form of thought which is both distinctively Islamic and also appropriate for life in modern scientific societies, a debate which is continuing within Islamic philosophy today (see Islamic philosophy, modern). Iqbal provided a rather eclectic mixture of Islamic and European philosophy, and some thinkers reacted to the phenomenon of modernity by developing Islamic fundamentalism (see Islamic fundamentalism). This resuscitated the earlier antagonism to philosophy by arguing for a return to the original principles of Islam and rejected modernity as a Western imperialist instrusion. The impact of Western scholarship on Islamic philosophy has not always been helpful, and Orientalism has sometimes led to an overemphasis of the dependence of Islamic philosophy on Greek thought, and to a refusal to regard Islamic philosophy as real philosophy (see Orientalism and Islamic philosophy). That is, in much of the exegetical literature there has been too much concern dealing with the historical conditions under which the philosophy was produced as compared with the status of the ideas themselves. While there are still many disputes concerning the ways in which Islamic philosophy should be pursued, as is the case with all kinds of philosophy, there can be little doubt about its major achievements and continuing significance.

Islamic philosophy: transmission into Western Europe

The Arabs took on the mantle of late antique philosophy and passed it on to both Latin scholars and Jewish scholars in Western Europe in the Middle Ages. The debates among Islamic scholars between rationalism and fideism also provided texts and models for Christian and Jewish debates. In this assimilation of Islamic thought, several stages can be observed. First, there was an interest in Neoplatonic cosmology and psychology in the latter half of the twelfth century, which fostered the translation of texts by al-Kindi, al-Farabi, the Ikhwan al-Safa' and, especially, Avicenna (Ibn Sina). Second, the desire to understand Aristotle's philosophy resulted in the translation of the commentaries and epitomes of Averroes (Ibn Rushd) in the second quarter of the thirteenth century. Jewish scholars participated in both these movements, and from the second quarter of the thirteenth century they took the initiative in translating and commenting upon Arabic texts. Thus when, in the late fifteenth century, a renewed interest in the ancient texts led scholars to search out the most accurate interpretations of these texts, it was to Jewish scholars that they turned for new translations or retranslations of Avicenna and, in particular, Averroes. From the early sixteenth century, Arabic philosophical texts were again translated directly into Latin, Arabic speakers began to collaborate with Christian scholars and the foundations for the teaching of Arabic were being laid. With the establishment of Arabic chairs in European universities, the rich variety of Islamic thought began to be revealed. This process has lasted until the present day.

1 Early translations: twelfth century

Some seventy works were translated from Arabic by Gerard of Cremona, nicknamed 'the Master' (*dictus magister*), at the cathedral of Toledo. These included Aristotle's *Posterior Analytics*, *Physics*, *On Generation and Corruption* and *Meteorology* I-III (see Aristotle), as well as four short tracts on natural science by Alexander of Aphrodisias. To these originally Greek works, Gerard added four philosophical letters of al-Kindi, a letter on proof by the Ikhwan al-Safa' and al-Farabi's *Kitab ihsa' al-'ulum (On the Classification of the Sciences)* (see al-Farabi).

Also at this time, the importance of the *al-Shifa' (Healing)* of Avicenna (Ibn Sina) was brought to the notice of Archbishop John of Toledo by a Jewish scholar called 'Avendauth' (perhaps the same as Abraham Ibn Daud, the author of *al-'Aqida al-rafi'a (The Exalted Faith)*). Portions of the text, including those on universals, physics (in part), the soul and metaphysics, were translated by Avendauth, Dominicus Gundissalinus (an archdeacon in the cathedral, *fl.* 1161-81) and a certain '*magister* John of Spain'. Members of this team also translated Algazel's *Maqasid al-falasifa (The Aims of the Philosophers)* (the first part of a two-part work, the second part being *Tahafut al-falasifa (Incoherence of the Philosophers)*) (see al-Ghazali); the *Mekor Hayyim (Fountain of Life)* of the Jewish philosopher Ibn Gabirol, translated into Latin as *Fons vitae*; and the *Liber de causis*, a cento of propositions from the *Elements of Theology* of Proclus, assembled in Arabic (see Liber de causis). Unattributed are translations of *On the Rise of the Sciences* (said in the Latin version to be by al-Farabi), and a compendium of sixteen questions on Aristotle's *On the Heavens* made by Hunayn ibn Ishaq and added to the selections from the *al-Shifa'* in the Latin tradition (*Collectiones expositionum ab antiquis grecis in libro Aristotelis De mundo qui dicitur liber caeli et mundi*).

Many of these works have a distinctly Neoplatonic tone, which is reflected in the original works of Gundissalinus and the anonymous author of the *Liber de causis primis et secundis et… qui consequitur eas (Book of the First and Second Causes and… Which Follows Them)*, who joins Avicenna to the radically Neoplatonic John Scottus Eriugena. Some of these works were being read in the late twelfth century at Oxford University, amongst whose scholars was, in all probability, the translator Alfred of Shareshill (responsible for the translation from Arabic of Nicholas of Damascus' *De plantis* and the sections from *al-Shifa'* on mineralogy, on inundations and, perhaps, on botany) whose commentaries influenced the style of philosophical teaching in the embryonic university (see Translators §3).

2 Thirteenth-century translations

The translation of *al-Shifa'* continued in the thirteenth century: Aristotle's *Zoology* was translated by Michael Scot, and the *Physics* (starting from the point where the earlier translation left off), *On the Heavens*, *On Generation and Corruption*, *On Actions and Passions*, *Meteorology* and perhaps the *Botany* were translated by Juan Gonsalvez de Burgos and a Jew called Salomon for Gonsalvez García de Gudiel, Bishop of Burgos

(1275-80), apparently from a single manuscript deposited in Toledo cathedral.

However, with the exception of the *Zoology*, these translations were hardly read. Rather, a new climate in which Aristotle's texts were on the one hand being accepted as the foundation for the arts curricula in the newly-founded universities, but on the other hand appeared to present some views dangerous to Christianity, made the interpretative works of Averroes (see Ibn Rushd) particularly relevant (see Aristotelianism, medieval). Many of the latter's commentaries on Aristotle's texts were translated. Michael Scot (d. before 1236), who moved from Toledo to the court of Frederick II in Sicily, translated Averroes' 'large commentaries' on the *On the Heavens* and probably those on the *On the Soul*, *Physics* and *Metaphysics* and others as well. Theodore of Antioch, the court philosopher, translated Averroes' *Proemium to the Physics*, and William of Luna, perhaps another member of Frederick II's circle, translated the 'middle commentaries' on the *Isagōgē* of Porphyry, and on Aristotle's *Categories* and *De interpretatione*.

Hermann the German (see Translators §3) translated the 'middle commentaries' on the *Rhetoric* (partial, together with excerpts on rhetoric from *al-Shifa'* and by al-Farabi), *Poetics* (in 1256) and *Nicomachean Ethics* (in 1240) in Toledo, but may also have been patronized by Frederick II's son Manfred, if he is the same as the 'translator Manfredi' mentioned by Roger Bacon (*Opus tertium*, cap. 25). Hermann's translation of Averroes' 'middle commentary' on the *Poetics* was the only form in which Aristotle's *Poetics* was known to Latin readers in the Middle Ages: William of Moerbeke made a Greek-Latin translation in 1278, but this was lost until the 1930s. The letter of Manfred to the philosophers of Paris, accompanying translations of 'Aristotle and other philosophers from Greek and Arabic', indicates one route by which these texts may have been transmitted, although the 'large commentaries' on *On the Soul*, *Physics* and *Metaphysics* were already known in Paris and Oxford in the late 1220s.

The fact that only authors whose writings have been translated from Arabic are included amongst the philosophers whose errors are listed by Giles of Rome - who mentions Aristotle, Averroes, Avicenna, Algazel, al-Kindi and Maimonides - gives some idea of the extent of the penetration of these texts. The margins of manuscripts of Aristotle's works on natural science from Oxford University in the same period, which are crammed with citations from Averroes' commentaries, also testify to this penetration.

The Arabic contribution to the Latin rationalist-fideist controversy began with the translation of Algazel's introduction to his double volume *Maqasid al-falasifa* and *Tahafut al-falasifa* by Gundissalinus' circle (see al-Ghazali). This introduction only survives in one manuscript, but was known to Roger Bacon. Maimonides' *Dalalat al-ha'irin (Guide to the Perplexed)*, originally written in Arabic (see Maimonides), which was read by and was most likely translated in the circle of Frederick II, provided material for the debate; both Algazel's work and Averroes' *Tahafut al-tahafut (Incoherence of the Incoherence)*, along with other texts, were used in the Arabic original by the Franciscan Ramón Llull, and in the polemical work *Pugio fidei (The Dagger of Faith)*, written in 1278 by the Dominican Ramón Martí. The doctrines of the Mu'tazila and Ash'ariyya, and especially the dialectical theologians (*mutakallimun*) were reported in the *Dalahat al-ha'irin* and the *Tahafut al-tahafut*, and Averroes' 'large commentary' on the *Physics* included the ideas of Ibn Bajja as well as of the Greek philosophers Themistius, Alexander of Aphrodisias and John Philoponus.

If the edict promoted by Llull at the Church Council of Vienne in 1312, calling for chairs in Arabic to be set up in four universities and the Papal curia, had been put into effect, Arabic studies in Europe might have had a different history. As it is, the teaching of Arabic in the Dominican mission schools and the use of newly-translated Arabic philosophical works by Dominican preachers against the Cathar heresy may have contributed to the interest in Arabic authorities shown by the Dominican masters, Albert Magnus (see Albert the Great) and Thomas Aquinas.

3 The contribution of Jewish scholars

Jewish scholars had often acted as interpreters of the Arabic texts for Christian translators or patrons. This practice continued in the fourteenth century when Calonymus ben Calonymus ben Meir translated Averroes' *Tahafut al-tahafut* from Arabic for Robert of Anjou, King of Naples. However, from the late thirteenth century onwards, most of the Latin translations of Arabic authors were made from Hebrew versions. When Jewish scholars in the West started to use Hebrew rather than Arabic as the language of learning, they began to translate a large number of Arabic philosophical texts into Hebrew. At least thirty-eight of Averroes' commentaries were translated into

Hebrew; the earliest of these is the 'middle commentary' on *De interpretatione*, translated at the court of Frederick II by Jacob Anatoli at the same time as William of Luna translated it into Latin. Thereafter in the thirteenth and fourteenth centuries several scholars in the south of France, Catalonia and Italy, including Moses ibn Tibbon, Shem Tov Ibn Falaquera, Levi ben Gerson (see Gersonides) and Moses of Narbonne translated Averroes' commentaries and other works, and wrote 'super-commentaries' on them. It was to these Hebrew versions that humanist scholars turned in the late fifteenth century, just at the time when the works of Aristotle, Avicenna and Averroes were being set in print (see Humanism, renaissance).

The new translations, patronized especially by Pico della Mirandola, Cardinal Domenico Grimani and Pope Leo X, were made by Elias del Medigo ('middle commentary' on *Meteorology* I-II, *Quaestiones* on *Prior Analytics*, the preface to Book Lambda of the *Metaphysics*, the 'middle commentary' on *Metaphysics* I-VII and the 'middle commentary' on Plato's *Republic*) (see Delmedigo, E.); by Paulus Israelita ('middle commentary' on *On the Heavens*); Abram de Balmes (epitomes of the Organon, 'middle commentaries' on *Topics*, *Sophistical Refutations*, *Rhetoric* and *Poetics*, the 'large commentary' on the *Posterior Analytics* and the *Epistola expeditionis* of Avempace (see Ibn Bajja)); Johannes Burana (epitome and 'middle commentary' on *Prior Analytics*, 'middle' and 'large commentary' on *Posterior Analytics*); Vitalis Nissus (epitome on *On Generation and Corruption*) and above all, Jacob Mantinus. This hard-working Jewish doctor from Tortosa had apparently been charged by Girolamo Bagolino, Romolo Fabi and Marco degli Oddi, the ambitious editors of Aristotle's complete works with Averroes' commentaries (finally published by Tommaso Giunta in Venice in 1550-2), with the complete overhaul of the translations of Averroes' commentaries. However, having made ten new translations of Averroes' texts (including another translation of the 'middle commentary' on Plato's *Republic*) and of Levi ben Gerson's 'super-commentary' on the Organon, he died in 1549 on a journey to Damascus. From the late 1530s onwards, the old translations were replaced or at least printed side by side with the new, as can be seen especially in the Giunta printing of 1550-2 and the subsequent Aristotle - Averroes editions of 1562 and 1573-6.

4 The beginnings of Arabic scholarship

The early sixteenth century also saw the beginning of a revival of the study of Arabic texts directly and, of providing the means to do this. A grammar and dictionary of Granadan Arabic by Pedro Alcalà was published in 1505. The kidnapped Arab scholar who took the name Leo Africanus, from Pope Leo X, provided biographies of Arabic authors after 1518. An Arabic manuscript of the so-called *Theology of Aristotle* (in reality parts of Plotinus' *Enneads* 4-6) (see Plotinus) was found in Damascus and, in the translation by Moses Arovas and Pier Nicolas Castellani, was published in Rome in 1519. Also in Damascus, Andrew Alpago revised the medieval translation of Avicenna's medical *Canon*, introduced two new works on the soul by Avicenna and described Sufi rituals from first-hand experience. In 1584, an Arabic press was set up in Rome by Giovan Battista Raimondi under the aegis of the Medici. Arabic studies became established through the efforts of Guillaume Postel, who took the first European chair in Arabic in Paris in 1535, and wrote a grammar, Franciscus Raphelengius, the author of the first dictionary of classical Arabic, Thomas Erpenius, the first to hold a chair in Arabic in Leiden in 1613 and the author of what became the standard grammar of Arabic, Jacob Golius and Edward Pococke. Pococke's *Specimen historiae Arabum* (including sketches of the ideas of a wide range of Islamic philosophers) and translation of Ibn Tufayl's philosophical novel, *Hayy ibn Yaqzan* (to which his son, of the same name, added an edition of the Arabic text), are indicative of the new, academic study of Arabic philosophy which was to flourish in European universities and which has culminated in the multi-volume publications of the Egyptian Academy's edition of the Arabic Avicenna, Simone Van Riet's *Avicenna Latinus* and the *Corpus Averroicum*. But at the same time, these works mark the end of a period in which Arabic authors were regarded as important for assimilating the knowledge which made humanity wise.

Islamic philosophy, modern

There are a number of major trends in modern Islamic philosophy. First, there is the challenge of the West to traditional Islamic philosophical and cultural principles and the desire to establish a form of thought which is distinctive. From the mid-nineteenth century onwards, Islamic philosophers have attempted to redefine Islamic philosophy; some, such as Hasan Hanafi and Ali Mazrui, have sought to give modern Islamic philosophy a global significance and provide an agenda for world unity.

Second, there is a continuing tradition of interest in illuminationist and mystical thought, especially in Iran where the influence of Mulla Sadra and al-Suhrawardi has remained strong. The influence of the latter can be seen in the works of Henry Corbin and Seyyed Hossein Nasr; Mulla Sadra has exercised an influence over figures such as Mahdi Ha'iri Yazdi and the members of Qom School, notably Ayatollah Ruhollah Khomeini. The philosopher Abdul Soroush has introduced a number of concepts from Western philosophy into Iran.

Finally, there have been many thinkers who have adapted and employed philosophical ideas which are originally non-Islamic as part of the normal philosophical process of seeking to understand conceptual problems. This is a particularly active area, with a number of philosophers from many parts of the Islamic world investigating the relevance to Islam of concepts such as Hegelianism and existentialism. At the same time, mystical philosophy continues to exercise an important influence. Modern Islamic philosophy is thus quite diverse, employing a wide variety of techniques and approaches to its subject.

1 Reactions to the West

There has been a tendency in the Islamic world since the late nineteenth century to explore the issue of the relative decline or decadence of Arabic intellectual thought and science as compared with its Western equivalent. During the Christian medieval period the Islamic world was in its cultural and political ascendancy, and was at the centre of theoretical work in both science and philosophy. However, by the nineteenth century an enormous gap had opened between the Islamic world and the West. A wide variety of explanations for this decline have since been sought.

The realization that this gap existed led to the *Nahda* (rebirth or renaissance) movement between 1850 and 1914. Beginning in Syria but developed largely in Egypt, the movement sought to incorporate the main achievements of modern European civilization while at the same time reviving classical Islamic culture which predated imperialism and the centuries of decadence.

The main problem facing the *Nahda* thinkers had was how to interpret the Islamic cultural tradition, including philosophy, in an environment dominated by the West. Jamal al-Din al-Afghani and Muhammad 'Abduh both argued that Islam is inherently rational and need not be abandoned in the face of the encroachment of Western forms of scientific and cultural thought. The Egyptian philosopher Mustafa 'Abd al-Raziq also argued that it is possible to demonstrate the authenticity of traditional Islamic philosophical work and its modern relevance within Islamic society. He posits an inseparable link connecting rationalism and revelation in Islam, and he defends the traditional Islamic sciences as compatible with science and rationality. In this he constitutes what might be thought of as a more conservative position than his predecessor 'Abduh, who was more dubious about the values of some of the Islamic schools of thought, in particular of Sufism (see Mystical philosophy in Islam).

Muhammad 'Abid al-Jabiri suggests that a viable Arab future can only come about through a deconstruction and critique of the reasons for the decline of the Arab world. He criticizes the dichotomy between the Islamicists, who hark back to a Golden Age in the past, and the liberal Westernizers, who praise the principles of the European Renaissance from which colonialism originated. The solution he offers is the freeing of modern Arabic thought from both the language and the theological limitations of the past. The Arab mind has become very much part and parcel of traditional ways of exploring the world, and is restricted in its potential if it remains too closely wedded to its Islamic heritage.

Fu'ad Zakariyya' argued that the Arab world declined due to its inability to historicize the past and its dependence on tradition, while Zaki Najib Mahmud brought out the importance of philosophy in taking us from the known to the unknown, and was critical of the ability of religion to interfere with this movement in thought. Hasan Hanafi

presents a form of phenomenology which argues that a new concept of *tawhid* (divine unity) should be developed which will involve a principle of unity and equality for all people. Hanafi also throws the charge of decadence back at the West, suggesting that the West is now entering a period of decadence and will require an infusion of ideas and energy from the East. He uses the language of liberation theology, which holds that revelation is adaptable to the language of each age (see Liberation theology). The original revelation was suited to the time and place of the Prophet and not necessarily of the current world. Modern Muslims should reinterpret revelation in modern language and in accordance with present demands; fossilized conservatism is a misinterpretation of the true dynamic and dialectical spirit of Islam.

Fazlur Rahman also contends that Islamic conservatism contradicts the essence of Islam. Islam's aims are economic reform and the establishment of a just social order (see Islamic theology §6). According to the Qur'an, he argues, moral and economic decline are related events. Therefore Islamic societies should turn away from petrified conservatism and educate their children in the new technologies. Islam should not be limited to communities of the faithful, but should seek a prominent place in the new ethical and social world order.

Another movement in Islamic political philosophy depicts Muslims not as the antagonists of Western culture, but rather as being in the vanguard of the globalization of peace and social justice. The most popular thinker of this school in the USA is Malcolm X, who began his career as an isolationist minister for the Nation of Islam movement. At first he used Islam to separate African-Americans from white people, but later he preached an internationalized Islam that reaches beyond racial and national differences.

An important African thinker in this tradition is Ali Mazrui, who tries to harmonize several interdependent factors in Islamic theology with current global realities. Mazrui proposes a marriage between the Islamic monotheistic *jihad* (universal struggle), Islam's anti-racist and humanist agenda, and the need for global economic cooperation; he employs culture as a vehicle for social change through his integration of multiculturalism, the politics of pan-Islamicism and the need for globalism. He takes Islam to be the first Protestant revolution in Christianity. Moreover, he suggests that Islam's economic message turns monotheism from isolated spirituality to communitarian humanism - in the form of a Muslim world order among a community of faithful (*umma*) - through global economic cooperation, social justice and the brotherhood of all. The essence of a multicultural perspective implies the acknowledgement that cultures project their own biases onto their perceptions of other societies. In a world which demands global economic policy-making and increasing interdependency, Mazrui believes that Muslims should see their religion of 'all is Godism' as a type of globalism. His innovation (*ijtihad*) interprets the Islamic *jihad* as an agenda of global peace and justice, thereby transforming what is taken to be a negative image of Islam into a signal for economic unity and world peace.

2 The Persian approach to philosophy

The area of the Islamic world which continued most forcefully the Islamic tradition in philosophy after the decline of Peripateticism is undoubtedly Persia (see Islam, concept of philosophy in §§3-4). Interestingly, one of the most staunch advocates of the form of thought which might be called neo-Illuminationism, and which stems from the *ishraqi* principles of al-Suhrawardi, is Henry Corbin (1903-78), a French philosopher who worked in Iran. Corbin was active in translating and interpreting post-Avicennan Islamic philosophy with an emphasis on shi'ism, *ishraqi* thought and the mysticism of Ibn al-'Arabi. He posited the existence of a perennial school of philosophical wisdom, which can be detected through the recurrence of archetypal symbols such as the icon of light. Such icons exist in the works of Shihab al-Din al-Suhrawardi in the early twelfth century AD, and have their source in Eastern (*ishraqi*) traditions such as Zoroastrianism, Hermeticism and Manicheism. (The term *ishraq*, which signifies 'light', also means 'East' or 'Orient'.)

For Corbin, '*ishraq*' designates not only a static spatial direction but a prescriptive invitation for a hermeneutic reorientation, whereby persons scrutinize their spiritual needs and points of return to archetypal origins. Corbin also discusses the role of the imagination, a faculty which exists between the senses and the intellect. While the senses perceive discrete data and the intellect categorizes, imagination is concerned with the world of archetypes (*'alam at-mithal*). For example, the notion of the perfect person (*al-insan al-kamil*) is an icon for the psychic centre. This centre signifies peace and the perfection of the self-realization process. Corbin asserts that by means of a series of epistemic states - which include revelation (*kashf*) and recollection (or archetypal memory) (*dhikr*) - one may return to the eternal origin. This process describes a cycle, thereby reasserting the Islamic theme of the

unity of being (*al-wahdat al-wujud*).

Corbin's followers, such as Hermann Landolt, William Chittick and Seyyed Hossein Nasr, have developed his ideas in a variety of different ways. The latter is the best known contemporary Islamic philosopher. According to him, people share a spiritual component that cannot be actualized by either descriptive or pragmatic accounts of nature. Nasr's world perspective includes a normative element which integrates people in the same way as earlier religions and cosmologies (Nasr 1993). In the past, everyone considered their religion to be the true religion; today, however, we are confronted with a plurality of religions. How can a Muslim attain a workable relation with the sacred in such an environment? Nasr employs Sufism to refer to the archetypal dimensions common to all religions; it is through the realm of mysticism that different forms of spirituality meet. The contemporary world creates the need for followers of different creeds and cultures to communicate.

Islam must coexist with the Western world, but this does not imply an Islamic surrender to all the practices of Western society. Nasr's views on Western scientific progress show his dissatisfaction with many Western perspectives. Citing the ecological disasters of overpopulation and pollution, Nasr criticizes the value of Western technological advances. According to him, the fault lies in the mistaken metascientific presupposition that an innate nature exists which is disconnected from humanity and can be investigated separately and controlled. Moreover, the increasingly pervasive quantitative perspective supplied by units of measurement - like that by which the size of a building might be described - is an incomplete outlook because it does not articulate the qualitative effects of what it describes on the surrounding environment. By contrast, Nasr holds that Islamic and Eastern perspectives on science and technology are integrative and harmonious. They stress unity in their studies of nature, thereby acknowledging the long-term ecological significance of development. Unless religious and spiritual values are embedded in a technological agenda, ecological disasters as well as a general lack of a sense of meaning in life are inevitable. Western science and its technological consequences are of ecological import to modern civilization. Consequently, neither science nor technology can consider itself irrelevant to environmental ethics (see Environmental ethics). Philosophy along Neoplatonic lines should be pursued, since only this form of analysis does justice to the spiritual wholeness of humanity.

The main emphasis in recent Persian philosophy has been on the thought of Mulla Sadra and al-Suhrawardi. Islamic philosophy has moved from the *madrasa* (traditional school) system and became an important part of the university curriculum. One of the most interesting thinkers is Mahdi Ha'iri Yazdi, whose work on knowledge by presence (*'ilm al-huduri*) provides an example of the fruitful combination of ideas from Western analytical philosophy and the *ishraqi* tradition in order to elucidate metaphysical and epistemological problems (Ha'iri Yazdi 1992). Recent Shi'ite theologians, as students of the work of Mulla Sadra, were versed in the dialectics of time and change. 'Ali Shari'ati, another student of Corbin, is an important social thinker whose work advocates a social process of Islamization. He rejects both the Peripatetic philosophers and the mystical thinkers, claiming that the existential being of each person contains a determination formed through mutual trust and compassion between them and God as their essence. This presumption is the ground for each person's being and the very core of each subject's potential for therapeutic unity (*tawhid*); its purpose is justice in both the providential and the social contexts. Islamization is achieved through an existential empathy and a phenomenological assimilation of exemplary people - such as the Imam Hossein (the Prophet's grandson) or Fatima (his daughter and the wife of Imam 'Ali) - into archetypal memory. The martyrdom of 'Ali or Hossein is a paradigmatic message, not for sorrow but for the assimilation of their characters into the self. Further, Shari'ati depicts history as a dialectical process which does not exclude economic and material realities, Islam as a practical religion or people as potential agents of justice. He replaces the Platonic theory of epistemic recollection with a theory of normative archetypal recollection. One may gain normative knowledge through the archetypal recollection of a religion's most exemplary mythical figures. Religion provides social ideals, and yet it demands not a withdrawal to a secret realm but a social revolution in the everyday world.

A creative commentary on Mulla Sadra was produced by Ruhollah Khomeini, who argues that people are primarily social as well as private citizens. Thus religious teachings relate not only to the personal morality of individuals but also to their social responsibilities and political actions (see Social sciences, philosophy of). In practice, these ideas imply a theocracy that does not distinguish between politics and religion. Bringing such a dominion into existence, he claims, requires an internal revolution from the masses directed against the existing ruling class, but this revolution must be guided by the directives of the religious authorities. He modifies Islamic

theology with the notion of the religious jurist-ruler’s guardianship (*velayat-e-faqih*), whose role is to guide the community of faithful in their universal struggle (*jihad*). This *jihad* is not essentially military, but is largely educational and seeks the expansion of monotheistic (that is, Islamic) ethics (see Ethics in Islamic philosophy).

Khomeini was a member of the School of Qom, based on the college in that city, which also produced Muhammad Hossein Tabataba’i, Murtaza Mutahheri and Muhammad Taqi Misbah Yazdi, all of whom have directed their influential thought at confronting the challenge to Islamic philosophy coming from the West. It should not be thought that this is an essentially reactionary strategy, however; Misbah has encouraged many of his students to study in the West and to take seriously scientific and logical thought as practised in the West. Also, although much of Misbah’s work has been on Mulla Sadra, he has been far from uncritical of the latter. In particular, he criticizes the notion of prime matter, which Mulla Sadra (§§1-2) identifies as the pure potentiality for existents. He questions the principle that a potentiality for existents exists prior to existents themselves; after all, there is nothing but existents. Misbah argues further that many relations are not truly essences. For example, in the mind-dependent realm, we may ascribe ‘below’ as a relation between a table and book, but this subject-directed ascription does not imply that below is an essence in the actual world.

An interesting and quite recent controversy in Persian philosophy has been that between Abdul Soroush on the one hand, and the philosophers of the school of Qom, as well as those influenced by the Corbin school, on the other. Soroush introduced a number of concepts from Western philosophy into Iran, in particular the leading ideas of Popper, Moore, Berlin and Wittgenstein. This led him to suggest that we should use a notion like that of collective reason to understand and interpret religious ideas. Collective reason is the best way of dealing with theoretical and practical problems, and is preferable to relying solely on solutions attainable through the efforts of the jurisprudents and religious authorities. Not surprisingly, this aroused the ire of the school of Qom philosophers, and their representative Sadiq Larijani engaged Soroush in a debate which largely dealt with the correct interpretation of thinkers such as Popper, Watkins and Stalnaker, and in particular Hempel’s paradoxes of confirmation (see Hempel, C.G. §2). Soroush was also attacked by the Corbin circle, whose basic philosophical approach relies very much on Heidegger along with traditional Islamic philosophy, and who were quite out of sympathy with the analytical nature of Soroush’s books. This controversy is interesting in that it brings out the fact that philosophers in Iran are generally familiar now not only with traditional forms of Islamic philosophy but also with the current philosophical ideas of the West. Modern philosophers do not entirely reject Western views, but neither are they completely taken over by the West; they are prepared to examine Western views with a critical sympathy.

3 Modern trends

A very vibrant area in Islamic philosophy is the history of philosophy, in particular the Greek tradition in Islamic philosophy. There exists both in the West and in the Islamic world a large number of scholars who have developed accounts of this close relationship and who continue to edit, translate and work on important texts in order to get some idea of the nature of the philosophical material which was produced in the early centuries of Islam. In addition, many philosophers in the Islamic world have adapted Western philosophy so as to make sense of the philosophical problems in which they are interested. C.A. Qadir in Pakistan developed an account of Islamic philosophy which he thought was in line with logical positivism, while ‘Abd al-Rahman Badawi applied existentialism to Arab society. Zaki Najib Mahmud followed William James in presenting a pragmatic account of philosophy. Some thinkers applied particular techniques in the Islamic tradition to philosophy, so that ‘Ali Sami al-Nashshar for example based his work on Ash‘arite theology (see Ash‘ariyya and Mu‘tazila), while Muhammad ‘Aziz Lahbabi (1954) used Hegelianism to develop a theory of being which is quite unusual within the context of Islamic ontology. Hichem Djait (1986) combines Hegelianism with existentialism. He argues that only dialectical epistemology can be used to understand the modern situation of the Arab world, and that the apparent opposites of decadence/renaissance, Arab/non-Arab, orthodox/heterodox, tradition/modernity need to be transcended if we are to understand the present nature of Islamic culture. Abdallah Laroui (1976) and Muhammad Arkoun (1985) both stress the contrast between Islam and modernity, and the former advocates the adoption of Westernization as the appropriate strategy for the Islamic world. In his approach to the Qur’an, Arkoun uses the semiotic ideas current in modern French literature to argue that Islam has always been changing and developing, so that there is no point in referring to a particular constant orthodoxy.

While many of these thinkers are hostile to mysticism and its Islamic form, Sufism, there can be little doubt that the latter represents a very potent framework for a good deal of present Islamic philosophy. The tradition of Sufism presents both a way of life which avoids many of the rigidities of traditional Islam and also a complex conceptual system which enables the philosopher to develop ideas and arguments which are intellectually satisfying. Modern Islamic philosophy employs a wide variety of different techniques and approaches to the subject.

Islamic theology

'Ilm al-kalam *(literally 'the science of debate') denotes a discipline of Islamic thought generally referred to as 'theology' or (even less accurately) as 'scholastic theology'. The discipline, which evolved from the political and religious controversies that engulfed the Muslim community in its formative years, deals with interpretations of religious doctrine and the defence of these interpretations by means of discursive arguments.*

The rise of kalam *came to be closely associated with the Mu'tazila, a rationalist school that emerged at the beginning of the second century AH (seventh century AD) and rose to prominence in the following century. The failure of the Mu'tazila to follow up their initial intellectual and political ascendancy by imposing their views as official state doctrine seriously discredited rationalism, leading to a resurgence of traditionalism and later to the emergence of the Ash'ariyya school, which attempted to present itself as a compromise between the two opposing extremes. The Ash'arite school gained acceptability within mainstream (Sunni) Islam. However,* kalam *continued to be condemned, even in this 'orthodox' garb, by the dominant traditionally-inclined schools.*

In its later stages, kalam *attempted to assimilate philosophical themes and questions, but the subtle shift in this direction was not completely successful. The decline of* kalam *appeared to be irreversible, shunned as it was by traditionalists and rationalists alike. Although* kalam *texts continued to be discussed and even taught in some form,* kalam *ceased to be a living science as early as the ninth century AH (fifteenth century AD). Attempts by reformers to revive it, beginning in the nineteenth century, have yet to bear fruit.*

1 The pre-Mu'tazilite groups

The term *kalam* has usually been translated as 'word' or 'speech', but a more appropriate rendering in this context would be 'discussion', 'argument' or 'debate'. Those who engaged in these discussions or debates were referred to as *mutakallimun* (those who practise *kalam* or debate). The term has special significance in that traditionalists disapproved of these discussions, arguing that the early Muslims were not known to have indulged in them. Those who dabbled in such debates were said to have 'spoken about' or 'discussed' (*takallma fi*) 'forbidden' topics. The proponents of *kalam* also liked to refer to it as *'ilm al-usul* (the science of basic principles) or *'ilm al-tawhid* (the science of [affirming God's] unity), and it is under this latter name that some of its topics continue to be taught and discussed in Muslim educational institutions today.

The rise of *'ilm al-kalam* was a result of the many controversies that had divided the Muslim community in its early years. Although the emergence of Islam was characterized by polemics with polytheists and followers of earlier revelations, controversies over fundamental religious questions were deemed irreverent by early Muslims, especially during the lifetime of the Prophet. However, disputes (mainly political) broke out immediately following the death of the Prophet, and again following the tragic events that led to the murder of the third Caliph Othman in AH 35/AD 656, this time heralding the breakdown of the political system established after the Prophet's death.

In a community that defined itself in terms of its religious identity, political disputes inevitably turned into theological ones. The political struggles over who should lead the Muslim community gave rise to three major competing groups: the Khawarij, who opposed the fourth Caliph 'Ali and rejected the compromises he made with his opponents; the Shi'a, who supported 'Ali; and the Murjiya, who tried to remain neutral. These groups attempted to influence a wider Muslim community dominated by a loose grouping of mainstream schools, mainly conservative or traditionalist, known collectively as *ahl al-sunna wa'l-jama'a* (the proponents of the [Prophet's] traditions and consensus).

The term *khawarij* (literally 'rebels') first referred to a group of dissidents who rebelled against the leadership of 'Ali following the inconclusive battle of Siffin (AH 37/AD 658) between 'Ali and his challenger, Mu'awiya, and later evolved into a distinct antiestablishment tendency. The Khawarij had neither a unified leadership nor a settled doctrine, and was primarily a militant political tendency with an uncompromising attitude. The core of their views revolved around the nature of legitimate leadership and the conditions for salvation. Although the Khawarij's uncompromising views condemned them to a marginal existence, their impact on the general body of the Muslim community was significant. Most of the major schools of thought that emerged did so in response to one or other

of their assertions, especially on the issues of leadership and the 'status of sinners'.

At the opposite pole stood the Shi'a (party) of 'Ali. Unlike the Khawarij, who defied all authority, the Shi'a believed in the undisputed authority of the divinely ordained *imam* (leader). The position of 'Ali as *imam* and successor to the Prophet was vouchsafed by revelation and was not a matter of opinion. Each *imam* would then designate his successor by virtue of the divine authority vested in him. In theory, Shi'ism should not have encouraged much theological speculation, since it sought to perpetuate and reproduce the authority of the Prophet and vest it in the person of the living *imam*, who had direct access to the divine truth. In practice, however, Shi'ism did indulge in theological speculation, especially with the emergence of the doctrine of the Absent *Imam*, which referred the burden of seeking the truth back to the community.

In between these two extremes, a large number of intermediary positions were espoused, notably that of the Murjiya. This group refused to condemn the perpetrators of grave sins (a euphemism for usurpers of power) as unbelievers, but neither did it want to absolve them, arguing that the matter should be left to God to judge in the hereafter. Murjiism was also associated with political neutrality, and an implied tacit support for the *status quo*.

While the above three groups were political in origin, adopting theological arguments to support their politics, there were also groups of which the primary focus was on theology. The earliest of these was the Qadariyya (the name, meaning proponents of *qadar*, or predestination, was a misnomer for this school which supported freedom of the will). This school argued for the absolute freedom of the will. God, its members said, would not put us human beings under obligation to act righteously if we did not possess the power to choose our course of action.

Diametrically opposed to this school were the Jabriyya (determinists). Their most prominent spokesman was Jahm ibn Safwan (d. AH 128/AD 746), who taught that no attributes could be predicated of God except for creation, power and action, since any attribute that could be predicated of creatures was not fit to be predicated of the Creator. As God is the sole Creator and actor, our actions are also authored by him alone; therefore, we as persons have no control over our actions and no free will. Jahm also said that since God could not be described as a speaker, the Qur'an could not be said to be his word, except in the sense of having been created by him.

2 Mu'tazila and rise of *kalam*

These earlier schools were amorphous groupings, very fluid both in membership and doctrine. With the exception of the Shi'a, who later developed into a number of coherent sects, these tendencies either faded away or merged into other tendencies. The rise of a systematic theological discourse had to await the emergence of the Mu'tazila. The association of *kalam* with the Mu'tazila, who were characterized by their elitism and their militant rationalism, determined its course and its eventual fate. The Mu'tazila attempted to systematize religious doctrine into a rational schema centred on the affirmation of God's absolute unity and absolute justice (see Ash'ariyya and Mu'tazila).

However, the Mu'tazila's elitism and their irreverent quest for 'a reason for everything,' to paraphrase al-Shahrastani, alienated the more conservative mainstream tendencies. The latter questioned the very possibility of a theological discourse of the type advocated by the Mu'tazila, regardless of content, viewing such discourse as at best superfluous and at worst a heretical deviation. This attitude was expressed succinctly by Malik ibn Anas (d. AH 179/AD 795), the leading jurist of Medina, when asked to explain how God could be said to have 'established himself on the Throne' as mentioned in the Qur'an: 'The establishment is known, the modality is unknown, the belief in it is obligatory and asking questions about it is an unwarranted innovation.' On the question of divine justice, the traditionalists rejected the Mu'tazila's attempts to impose human and rational concepts of justice on God. It would be meaningless to speak of justice in this context, since God was the absolute sovereign and absolute master of all His creation, which meant that anything which He did was by definition just (see Omnipotence §5).

The struggle between the two trends came to a head in the 'creation of the Qur'an' controversy which erupted in the first half of the third century AH (ninth century AD). The 'Inquisition' which the Mu'tazila instigated with the help of the ruler of the day, the Caliph al-Ma'mun (AH 198-218/AD 813-33), to enforce this and related doctrines proved disastrous, not only for the Mu'tazila but also for the discipline of *kalam* itself. In spite of being reclaimed for orthodoxy by Abu'l-Hassan al-Ash'ari and others, the science and art of arguing matters of faith with appeal to unaided human reason fell into disrepute and went into a decline from the start of the sixth century.

3 Main themes

Classical definitions tended to emphasize the apologetic function of *kalam*, probably in order to appease traditionalist critics. Al-Iji speaks of 'a science which makes it possible to prove the truth of religious doctrines by marshalling arguments and repelling doubts' (*al-Mawaqif*: 7). *Kalam*, however, has also been the arena on which battles over what constituted true religious doctrine were fought between rival schools.

The subject of *kalam*, to quote al-Iji again, was 'knowledge on which the proofs of religious doctrines depend, directly or indirectly' (*al-Mawaqif*: 7). It was also said to deal with *'usul* (basics), as opposed to *furu'* (subsidiary issues). These included the fundamentals of religious belief, such as God, his attributes and acts, the proofs of religious doctrines, the nature of the universe and our place in it.

The first issue that divided Muslims into opposing schools was the question of political authority and its legitimacy. Most traditionalist and mainstream schools accepted the actual procedures adopted to elect the first four caliphs as normative, thus affirming that a ruler gains legitimacy by being freely elected by the influential members of the community. The Khawarij accepted the procedures up to the election of the third caliph, but then added that even an elected caliph should be removed if he deviated from his mandate. The Khawarij also held that any qualified individual was fit to be caliph, provided the community at large approved of him. The traditionalists narrowed the field of selection to the Prophet's tribe, Quraysh, while the Shi'a narrowed it still further to the Prophet's family, in particular his son-in-law 'Ali and the latter's descendants. Shi'ism argued that political leadership, being the most important religious institution, could not be left for human reason to determine.

The second major issue to be discussed within *kalam* was the status of the grave sinner. The Khawarij started this debate by arguing, contrary to mainstream opinion, that any person who committed a grave sin automatically became a non-believer, thus forfeiting all rights and protections afforded by Islamic law. The Murjiya argued for the withholding of judgment while tending to widen the interpretation of who could qualify as a believer; the Mu'tazila held that such a person was in an intermediate position, being neither a Muslim nor an unbeliever.

The third major issue discussed in *kalam* was freedom of the will. The Mu'tazila and Qadariyya both came out unequivocally in support of freedom of the will. They held that we are the creators of our own acts, for otherwise God would be committing a grave injustice if he were to punish those who had no choice in what they did (see Evil, problem of §3; Free will). At the other extreme, the Jabriyya held that man could not have any control over his actions, since God was the sole creator and actor. Most other groups tried to strike a balance between these two poles. The Shi'a tended to affirm the freedom of the will and some of them, such as the Zaydiyya, agreed completely with the Mu'tazila on this. Some Shi'a factions, however, qualified their stance by affirming that we are in part compelled because of the chain of causation that triggered our acts. The Khawarij accepted the idea of predestination, holding that God was the Creator of the acts of people, and that nothing occurs which he did not will.

This was also the view of mainstream orthodox and traditionalist groups, who affirmed that the will of God was supreme and that he was the creator of all human acts, whether evil or good; nothing could happen on earth that contradicted his will. This position was later given some nuances by al-Ash'ari, who argued that God created human acts, but we acquired (*kasaba*) these acts by willing them prior to their creation.

The fourth major issue discussed in *kalam* was the question of divine attributes. The Jabriyya used the affirmation of the uniqueness of God's attributes to deny the existence of free will. The Mu'tazila developed the idea further, arguing that God could not have attributes in addition to his essence, for this would mean a multiplicity of eternal entities. Later Mu'tazilites, such as Abu'l-Hudhayl al-'Allaf (d. AH 227/AD 842), added that the divine attributes are identical with the divine essence. God's knowledge is not an attribute added to his essence, but is identical with that essence.

Early Shi'ite theologians opposed the Mu'tazila, affirming God's immanence in space and denying his immutability and transcendence of time and space. They held that God's will was also mutable, and ascribed motion to him. God could also be the locus of accidents (*hawadith*) and was corporeal in some sense. God's knowledge and will could not be eternal, for this would negate human freedom and make accountability redundant. It could also imply the eternal existence of things. Later Shi'ite theologians, however, especially the Zaydiyya,

repudiated most of the anthropomorphisms of their predecessors and veered towards Mu‘tazilite positions.

Traditionalists (who include the Ash‘ariyya) affirmed the reality of God’s eternal attributes, which they said were neither identical with his Essence nor distinct from it. They also affirmed the literal sense of apparently anthropomorphic Qur’anic references, such as those to God’s ‘face’, ‘hands’ and ‘eyes’, adding that the exact nature of these limbs could not be known.

Related to the issue of divine attributes was the issue of the Qur’an’s creation. The Mu‘tazila denied that God’s words were eternal and affirmed that the Qur’an had to be created; this idea was accepted also by the Khawarij. However, the bulk of the traditionalists (and Ash‘ariyya) rejected this view, arguing that one could not describe God’s speech as created because this would mean that God was subject to changing states. Speech (*kalam*) was one of God’s eternal attributes, and the Qur’an, being God’s word, could not be said to be created or uncreated. Some early Shi‘i theologians, in particular Hisham ibn al-Hakam (d. *c.* AH 200/AD 816), developed a more sophisticated version of the latter argument, saying that the Qur’an (or God’s word) could not be described as creator, created or uncreated, because an attribute, being an adjective, could not have another adjective predicated of it. Similarly, one could not say about God’s attributes that they were eternal or contingent.

Besides these main themes, *kalam* touched on related issues such as whether God could be seen in the hereafter (with the Mu‘tazila rejecting this, while their opponents affirmed beatific vision), the nature and limits of faith, whether hellfire and paradise were everlasting, and the nature and limits of God’s knowledge, will and power. Starting with ‘Allaf, some philosophical themes were introduced into *kalam*, in particular the discussion of such questions as the nature and classification of knowledge and the nature of movement, bodies and things. It even went on to discuss questions belonging to other sciences, such as biology, psychology and chemistry, as well as various logical investigations. However, this expansion of the scope of *kalam* coincided with its decline and did not lead to significant advances in any of these areas.

4 Methodological tendencies

Kalam generally dealt either with attempting to justify religious beliefs to reason, or with employing reason to draw new conclusions and consequences from these beliefs. Its doctrines comprise three major components: the articulation of what a school regarded as fundamental beliefs; the construction of the speculative framework within which these beliefs must be understood; and the attempt to give coherence to these views within the accepted speculative framework.

The various schools of *kalam* agreed with the traditionalists in accepting the authority of texts as the basis of the first component. They disagreed, however, about the extent to which these texts should be subjected to ‘rational’ analysis. Traditionalists had always suspected that the ‘reason’ being referred to was in fact the suspect intellect of infidel heretics; why else would a believer want to drag the articles of faith in front of the court of human reason, fallible and limited as it was? The traditionalist suspicion of non-Islamic influences behind every early *kalam*-ist ‘heresy’ has been reproduced by modern researchers, who seek an alien origin for every idea expressed in *kalam* (see Orientialism and Islamic philosophy). However, the impact of non-Islamic influences on the evolution of the schools of *kalam*, though undeniable, could easily be exaggerated. Many of *kalam*’s early themes, such as the status of the sinner or the question of political legitimacy, appear to have arisen within a purely Islamic context.

Regarding the second component, the speculative framework, the early groups did not erect elaborate systems. It is with the Mu‘tazila that we find the first attempt to construct such a system, based on their five principles (divine unity, divine justice, divine warnings, the intermediary status and the enjoining of virtue and discouragement of vice). The Mu‘tazila also brought with them an attitude of absolute confidence in human reason and a consequent lack of reverence for the authority of texts, which they regularly challenged.

The third component, the cohesion of views within the speculative framework, also came into prominence with the Mu‘tazila, who tried to systematize the body of religious beliefs and harmonize its components, provoking intense controversy as they attempted to reinterpret key elements of orthodoxy in order to achieve this. The attempts at systematization inevitably led to the raising of philosophical questions. Later Mu‘tazilite thinkers, such as al-‘Allaf and Ibrahim al-Nazzam (d. AH 231/AD 846), reflected in their theses the influence of translated Greek philosophical texts and propagated a worldview influenced by Hellenistic speculation (see Greek philosophy:

impact on Islamic philosophy). The Ash‘arite school, especially al-Juwayni and al-Ghazali, formally introduced the tools of Aristotelian logic into the methodology of *kalam* (see Logic in Islamic philosophy).

This introduction of philosophical themes and methods and the employment of formal logic in the Aristotelian tradition represented a significant development in *kalam*. Prior to that, *kalam* arguments had used textual and linguistic analysis as their central tools. However, in spite of these forays into philosophical speculation and the employment of Aristotelian logic, *kalam* remained firmly anchored in a specifically Islamic framework. Authoritative texts were routinely cited to clinch an argument, while an accusation of heresy was thought to be a conclusive refutation of any argument.

Even without the help of philosophy, however, Ash‘arism brought to *kalam* a trenchant scepticism that had a healthy impact on the field of rational argument. This scepticism was carried to great lengths by al-Ghazali, who used it to demolish the confused Neoplatonism of the Hellenizing philosophers. This approach had the potential to contribute much more to the advancement of knowledge than the dogmatic reiteration of philosophical theses, but that potential was not to be realized because the *kalam* practitioners were more interested in demolishing their opponents' arguments than in constructing viable alternatives.

5 Later evolution and decline

The decline of *kalam* proceeded apace from the fifth century AH (eleventh century AD), settling by the ninth century AH (fifteenth century AD) into ossified dogmatic texts that, to paraphrase al-Ghazali, taught the dogma as well as its formal 'proof', which was not the same thing as proving it to be true. This decline of *kalam* became too apparent to ignore even by its practitioners. Al-Iji comments that the aversion to the discipline in his time meant that engaging in it had become 'among the majority a reprehensible thing' (*al-Mawaqif*: 4). Ibn Khaldun, another Ash‘arite writing during the same period (*c.* AH 779/AD 1377), deplored the fact that *kalam* had deteriorated and become confused with philosophy, on top of being redundant because the heresies it was meant to combat had become extinct.

However, *kalam*'s problem was not so much its fusion with philosophy as its failure to evolve into a fully-fledged philosophical system with its own complete frame of reference. The possible evolution in this direction had been interrupted by a number of factors. First, there was the rift that developed between *kalam* as a discipline and philosophy proper; this was caused in part by the decline of the Mu‘tazila, the natural allies of philosophy. In addition, the failure of the Mu‘tazila to develop a common language with their opponents, thus turning *kalam* into a kind of sectarian pursuit rather than a discipline, was duplicated by the philosophers. The quasi-religious reverence shown by early Muslim philosophers to Greek texts put them at odds with mainstream thought, causing them to behave like just another sect. This limited the interaction between *kalam* and philosophy, as each treated its basic principles and texts as 'sacred' rather than as theses which could themselves be questioned. The rise of philosophy thus came both at the expense of *kalam* and in opposition to it, and this antagonism damaged both.

Kalam was also undermined by the rise of pro-traditionalist tendencies within the discipline itself. It was difficult to reconcile vigorous rationalist discourse with the traditionalist position, which discouraged questioning in many key areas and even counselled the acquiescence in apparent contradictions. At another level, the resurgence of traditionalism under Ahmad ibn Hanbal and subsequent revivals under Ibn Taymiyya and his disciples was anti-*kalam*, rejecting not only its theses but its methods as anathema. Rearguard actions fought by Ash‘arite and Maturidi scholars of the fifth to eighth centuries AH (eleventh to fourteenth centuries AD), failed to stem this tide and revive *kalam*. Finally, complementing the effect of traditionalism was the rise and popularity of Sufi mysticism (see Mystical philosophy in Islam). Although opposed by traditionalism, Sufism was also anti-rationalist and had also grown at the expense of *kalam* and philosophy.

With all these powerful forces deployed against it, the decline of *kalam* was inevitable. The early schools of *kalam* all became extinct, but traces of their teachings remain embedded within the doctrines of the six main schools of Islamic jurisprudence. The two main Shi‘a schools (the Ithna ‘Ashriyya and Zaydiyya) have inherited some aspects of Mu‘tazilite rationalism and doctrines. Shi‘ism has also been more successful in assimilating Sufi tendencies and more reconciled to philosophical discourse. The Hannafiyya became closely associated with the Maturidi school of *kalam*. The Shafi‘iyya espoused Ash‘arism as a general rule, as did the Malikiyya, although with less enthusiasm. The Hanbalites favoured an anti-rationalist and anthropomorphic position, distrusting *kalam*

altogether.

6 Conclusion

The manifest failure by the various schools of *'ilm al-kalam* either to create for itself a secure niche among the religious sciences, or to attain the status of a philosophical system independent of religious dogma, was not merely the result of the arrogant elitism of the Mu'tazila and their political opportunism. A deeper malaise afflicted the rationalist schools, reflected in their methodological confusion and, simultaneously, their militant dogmatism. Ironically, it was left to the traditionalist theologians, notably al-Ash'ari, al-Ghazali and Ibn Taymiyya, to introduce some healthy scepticism into the discourse by revealing some of the more glaring self-contradictions of the rationalist dogmas. However, the traditionalists not only inherited some of the confusion of their opponents, they also added some of their own.

An interesting example of this confusion was the uncritical acceptance by all schools of *kalam* of the Neoplatonic premise that the perfection of God as an eternal being meant that he could not be the locus of accidents (*hawadith*), while rejecting its logical consequence: God's remoteness from his creation and the impossibility of his day-to-day involvement with it. The confusion which this self-contradiction generated was then cited by many as a proof of how inadequate reason was in dealing with matters of faith. The choice offered the community was thus between rationalists who discredited themselves by their manifest errors, and traditionalists who exploited these errors and confusion to discredit rational thought as such.

The attacks of self-doubt brought by turmoil of modern times have created an atmosphere for a revival of Islamic theology and philosophy (see Islamic philosophy, modern). The pioneers of the modern Islamic revival, such as Jamal al-Din al-Afghani and Muhammad 'Abduh, tried to revive Islamic philosophy and *kalam*; al-Afghani indeed insisted that the revival of philosophy was an indispensable precondition for any Islamic revival. A century later, the tides of revival have drowned all attempts at philosophizing. On the face of it, the vibrancy and capacity for self-regeneration of the Islamic faith seem to be proportionately resistant to the emergence of systematic theologies and philosophies.

However, in spite of the self-satisfaction on the part of orthodoxy, on the grounds that history has condemned the systems rejected by Islam as fatally flawed and confused, there can be no substitute for setting up a viable worldview and a defensible theology, which would remain fallible and incomplete but still an essential guide for life. It would seem that if Islam is to continue as a living system, *'ilm al-kalam* (or something like it) may need to be revived, so that progress towards Muslim self-understanding, interrupted some six centuries or so ago, can be resumed.

Israeli, Isaac ben Solomon (*c*.855-955)

A pioneering Jewish philosopher and a physician, Isaac Israeli was among the very first medieval Jewish writers to formulate a philosophy employing Greek sources. He based his metaphysics chiefly on the Neoplatonic theory of emanation. However, like many later Jewish philosophers, Israeli understood God as a voluntary agent who acted through power and will. He combined a commitment to the traditional doctrine of creation ex nihilo *with the idea of emanation: the first level of the ontic hierarchy was formed by divine creation but lower levels emerged by emanation. This original synthesis was Israeli's most prominent philosophical innovation.*

Israeli's anthropology was at base largely Neoplatonic, teaching that the soul can ascend the emanatory ladder back to God. The first Jew to give a psychological account of prophecy, Israeli, unlike later Jewish thinkers, did not discuss at length the relation between his philosophical ideas and traditional sources. His pioneering work did not have a decisive impact on later generations of Jewish thinkers; he was known in Latin Europe, but mainly for his medical writings.

1 Life and career

Little is known about the life and background of Isaac ben Solomon Israeli, a Jewish philosopher and physician who lived in North Africa. He was one of the earliest medieval Jewish philosophers and a distinguished physician in the court of the Fatimid caliph in Kairouan (modern Tunisia). His disciple, Dunash ibn Tamim, mentions a philosophical correspondence with Saadiah, later known as Saadiah Gaon - who, like Israeli, was of Egyptian origin - in which Saadiah presented questions to his older contemporary.

In spite of his long life, Israeli never married. He is said to have remarked that his books would be a greater guarantor of immortality than children. His numerous writings include such philosophical works as the *Kitab al-hudud wa 'l-rusum (Book of Definitions)*, *Kitab al-ustuqussat (Book on the Elements)*, *Kitab al-jawahir (Book of Substances)*, *The Book on Spirit and Soul* and the *Chapter on the Elements*, and such medical works as *Kitab al-Hummayat (Book of Fevers)*, *Kitab al-adwiya al-mufrada wal-aghdiya (Book of Foodstuffs and Drugs)*, and *Kitab al-baul (Book of Urine)*. Although written in Arabic, these books are known to us mainly in Hebrew and Latin translations.

Israeli was not on the whole an original philosopher; he tended to the eclectic, but he was one of the first Jewish thinkers to recognize the value of the Greek philosophical tradition, known to him through Arabic translations. Adopting ideas from both Aristotle and Plato, he assumed agreement between the two, as did his Muslim contemporary al-Farabi. Israeli was most directly influenced by al-Kindi, the first major Muslim philosopher, and by an unknown Neoplatonic work, traces of which are found in later Jewish philosophical writings. He made concerted efforts to integrate ideas from his sources into a unified, rational outlook, but did not attempt explicitly and systematically to reconcile philosophical methods with Jewish tradition, as Saadiah later sought to do.

Despite his varied sources and his quest to bridge opposing viewpoints, Israeli is clearly an early Jewish Neoplatonist, as can be seen in his emanationism, his ideas of illumination and unification with the divine light, and the general Neoplatonic cast of his imagery (see Neoplatonism). When Jewish thought turned toward Aristotelianism, Israeli's views were largely forgotten. Maimonides dismissed him as 'only a physician', and called his books 'futile and vain'.

2 Metaphysics

The central questions of Neoplatonism, as laid out by Plotinus, were first, how and why plurality entered the world from the One, that is, God; and second, what was the source of matter if the One is absolutely incorporeal (for if it were corporeal, it would not be absolutely One). The Neoplatonists found their answer in the idea of emanation: the One timelessly produces a series of hypostases. Each flows from that which precedes it in a procession that transcends the limits of any merely natural process, and seemingly any volitional process as well. The further a hypostasis is from the Source, the more plurality enters into it until, ultimately, the level of sheer matter is reached. Plotinus follows emanation from the One, to the divine and universal Mind, to the world Soul, and then to Nature. However, the Neoplatonic tradition that reached Israeli proposed a more complex scheme, partly as a result of efforts to introduce a dimension of voluntarism into the process of emanation (see Voluntarism, Jewish).

Israeli envisioned the following series:

The Creator (with will and power);
First form (wisdom) and first matter - intellect;
The rational soul;
The animal soul;
The vegetative soul;
Nature (= sphere = heavenly bodies);
The four elements.

God acts as a voluntary creator. Power and will are aspects of God, not independent hypostases (as contrasted with the view of the later Jewish Neoplatonist Solomon ibn Gabirol). In traditional Neoplatonism, all entities emanate from the One (see Neoplatonism), but Israeli taught that the first form and the first matter were created *ex nihilo*. The remaining spiritual substances arise by emanation from these. Hence there is a double creation: a voluntary act of God at the start of creation, and emanation as its continuation. This unconventional and original theory clearly seeks to to unite Neoplatonic premises with Jewish tradition.

Israeli deviated from other Plotinian ideas in describing the remaining hypostases too, although these deviations were generally not original to Israeli but were derived from the Neoplatonic tradition. For example, Israeli located matter in the beginning of creation. He also identified the first form with the divine wisdom which together with the first matter, forms the intellect. He divided the hypostatic soul, in accordance with the Aristotelian scheme, into rational, animal and vegetative souls (see Aristotle), and replaced Plotinian nature, with the Sphere, that is, the heavenly bodies from which the four elements proceed.

3 Anthropology

Israeli adopted the Neoplatonic doctrine of the return of the soul through purification and illumination. The goal of the ascent is unification with the supernal light, not directly with God. Some human beings, whose evil nature and impurity prevent them from ascending to the spiritual substances, are left below the sphere, tormented by heat and fire. Thus Israeli combines rabbinic teachings concerning heaven and hell with Neoplatonic doctrines about the destiny of noble and base souls.

Analysing the nature of prophecy, without direct reference to the Bible or the rabbinic sources, Israeli used Neoplatonic accounts of the intellect and the soul to forge the first Jewish psychological account of prophecy (see Prophecy). A prophet, who is also a philosopher, seeks to direct people toward righteousness. Prophetic inspiration is manifested mainly in dreams, when the powers of the soul apprehend spiritual objects. Prophets transmit what they receive to the people, sometimes clearly, sometimes through obscure expressions which need to be explained. Although he did not explicitly discuss such distinctively Jewish topics as the commandments or the revelation at Mount Sinai, Israeli does obliquely indicate his sensitivity to these theological themes.

The Jewish Neoplatonists who followed Israeli were to a certain extent influenced by him, as were the Kabbalists of the school of Gerona (see Kabbalah). Yet it is difficult to conclude that Israeli had a decisive influence on later Jewish thought. His work did not address the core issues of theology that occupied so many other Jewish thinkers, and his Neoplatonism came to seem irrelevant or primitive. He did, however, win the immortality he sought through his books, which are still studied a thousand years after his death.

Italy, philosophy in

Since the Renaissance, Italian philosophy has been rooted in the humanist and historical tradition, stemming from the rediscovery of Greek philosophy in the fifteenth century and the resumption of classical studies at that time. However, the momentous cultural and religious transformations of sixteenth-century Europe caused a reaction which greatly restrained the innovative impact of Renaissance thought. Living through these two periods, Bruno, Campanella and Galileo experienced all the conflicts of the Counter-Reformation, when philosophy especially felt the weight of the Roman Catholic Church which exercised a tight control on the culture of the time. The best traditions of the Renaissance were inherited and maintained solely by Vico, the most important figure of this latter period.

As the spirit of the Counter-Reformation declined, Italian philosophy acquired a new vigour in the eighteenth and nineteenth centuries. This occurred especially in the north of the country where contacts with modern European culture influenced a political situation dominated by the question of national unity (a problem debated since the time of Machiavelli). Philosophical thought during this period tended to be strongly political (as in the philosophy of Cattaneo), although it also assumed a deeply religious tone (for example, Mazzini and Gioberti). These themes were united in Hegelian Idealism, promoted by Spaventa among others. The neo-Idealists of the early twentieth century, such as Croce and Gentile, distinguished themselves by assuming a political role and by opposing empiricism and positivism, philosophical heirs of the Enlightenment which were traditionally considered alien although popular at that time.

The aftermath of the Second World War brought to gradual dissolution both philosophical and political neo-Idealism, a movement which was rooted especially at the universities of Rome and Naples; it also saw the rise of Marxist thought (Gramsci) and Existentialism, especially at the universities of Bologna, Milan and Turin. Among the most important figures in contemporary Italian philosophy we find Bobbio (political philosophy), Pareyson, Vattimo and Eco. While both French and German philosophy still play a major role in the philosophical debate, in recent years increasing attention has been paid to Anglo-Saxon philosophy.

1 From Counter-Reformation to Enlightenment

The great philosophical blossoming of the fifteenth and sixteenth centuries, which in Italy had started with the revival of the *humanae litterae*, came to a decisive and lasting halt with the Counter-Reformation movement which began with the Council of Trent (1545-63). The new cultural climate - inspired by an idea of humanity and human destiny which bore little resemblance to the spirit of liberty, creativity and loyalty typical of philosophers and artists such as Pico della Mirandola, Marsilio Ficino, Leonardo da Vinci and Michelangelo - prevailed in the second half of the sixteenth century and especially in the seventeenth century. Indeed, the general lack of cultural confidence expressed itself as censorship, especially of the three main philosophers of the sixteenth and seventeenth centuries: Bruno and Campanella (both heirs to Telesio's naturalistic tradition, combined with Neo-Platonist, magical and cabalistic ideas), and Galileo.

Having fled Italy to avoid being persecuted by the Church for his philosophical ideas, Giordano Bruno lived in England between 1583 and 1585, where he wrote and published works which were later gathered under the title of *Dialoghi Italiani (Italian Dialogues)*. When he returned to Italy, he was condemned by the Church authorities to die at the stake in 1600. Central to his philosophy is the idea of the unity and infinity of nature which the Copernican system, through Neo-Platonist metaphysics, attempts to demonstrate. The universe is one, open and infinite, and may contain many worlds. The unity of nature means that it contains within itself the principle of its own movement. Bruno thus adapts, and uses against Aristotle, the hylozoistic idea of the Presocratics to which he often refers. Corresponding to this naturalistic concept is an ethical vision that unites contemplation and activity through a radical criticism of medieval virtues and the defence of worldly virtues. The *eroico furore* (heroic fury) is the synthesis of theoretical knowledge and practical activity which allows the individual to grasp the dynamical unity of nature, a composition of opposing tensions (*coincidentia oppositorum*) that Cusano had previously attributed solely to God.

Tommaso Campanella, a contemporary of Bruno, further undermined the influence of Aristotelian philosophy (still prominent at the University of Padua). His epistemology is a combination of Augustinism and empiricism:

knowledge is sensation, but its justification is grounded on the internal awareness of self (*sensus inditus*) By referring to Augustine (§§4, 5), Campanella anticipates Descartes. His naturalism is full of references to magic (*De sensu rerum et magia*, 1620), on which he builds his religious, ethical and political vision - the ultimate goal of magic is ‘to give laws to men’. In his *Città del sole (City of the Sun)* (1623) Campanella describes the organization of an ideal city (like Thomas More’s *Utopia* or Plato’s *Republic*). The three principal officers (Captain, Wisdom and Love) and supreme head (Metaphysic or Sun) are personifications of metaphysical and religious principles derived from the synthesis of Christianity with a natural religion of a strongly naturalistic and magical character, which in its essence tries to be ‘rational’. The extent of Campanella’s awareness of the developments in scientific thought is evident from his *Apologia pro Galilaeo* (1622).

Galileo is credited with having been the first to formulate what has gone down in history as the ‘Galilean scientific method’ (see Galilei, Galileo). However, unlike Bacon, he never actually explicitly formulated this method - it was derived from his scientific treatises, including the *Saggiatore (The Verifier)* (1623), the *Dialogo sui massimi sistemi (Dialogue on the Chief World Systems)* (1632), and *Discorsi e dimostrazioni matematiche intorno a due nuove scienze (Dialogues and Mathematical Demonstrations about Two New Sciences)* (1638). As a result of this method, using some fundamental concepts (such as causality) and ideas from the traditions of Ockham and of Naturalism (which had undermined medieval ways of thought), Galileo made scientific discoveries of enormous importance in both astronomy and in physics. Unlike Bruno and Campanella, he based his study of nature on mathematics and excluded anything metaphysical or magical. Only what is measurable (what Locke was to call ‘primary qualities’) can be the subject of investigation: this establishes a distinction between religion/philosophy and science, and guarantees the autonomy of the latter from the former.

While Galileo was not a philosopher in the strict sense of the word, the cultural importance of his personal vicissitudes, and his trial and conviction by the Inquisition, is especially significant. Bruno and Campanella remained isolated in the tragedy of their personal circumstances because the philosophy of each of them was closely tied to his personality. In the case of Galileo, the condemnation did not manage to stem the spread of his ideas, because they were based on a new methodology which was destined to dominate on its own merits. The immediate influence of Galileo was therefore mainly confined to the scientific sphere, where his pupils initiated an important series of studies, especially in the field of mathematics. Bonaventura Cavalieri, for example, sought to replace the method of indivisibility with the method of exhaustibility in the calculation of volumes and areas: Evangelista Torricelli, possibly Galileo’s greatest pupil, built on these discoveries. Vincenzo Viviani is known for his work on geometry, and Michelangelo Ricci was the author of a book on the problem of tangents and of maxima and minima.

The Counter-Reformation movement sought to reunite philosophy, science and religion, whose compartmentalization had given rise to the new science based on experimentation (Galileo himself tried throughout his life to show that the three disciplines were compatible with each other). Campanella more than anybody had tried to achieve this goal: the *Città del Sole* is in fact the idealization of a world in which religion, science, philosophy and politics find a harmonious synthesis. Less idealistic, on the other hand, is the political thought of the Jesuit Giovanni Botero, author of *Della ragion di stato (About the Reason of State)* (1589). In this work he opposes Machiavelli by attempting to bring ethics back into politics, believing justice to be the prince’s supreme virtue and claiming that politics is ultimately subordinate to the counsels of religion. At this time Alberico Gentili, professor at Oxford and one of the first theoreticians of natural law, maintained in his *De jure belli* the existence of rights that apply even in times of war (respect for prisoners, women and children and so on), holding that the only just war is carried on in self-defence.

Continuing Counter-Reformation preoccupations meant that Italian philosophy of the seventeenth and eighteenth centuries was limited to repeating scholastic arguments. The thought of Descartes, Hobbes (who had visited Galileo during his exile at Arcetri), as well as that of Leibniz and Berkeley (both of whom had also visited Italy), had little impact (but see Fardella, M.). The first figure of note in this period took an open stance *against* European thought, continuing in that tradition of historical Humanism typical of Italian thought (especially of the Neapolitan school down to the present day). Gianbattista Vico was a seventeenth-century humanist who, like all other humanists, regarded the Middle Ages a time of barbarism and considered the main path of knowledge to lie in the synthesis of philology and philosophy. In contrast to Descartes, Vico denies that evidence is the criterion of truth or that the *Cogito* could convince sceptics. In fact, one can only know what one has done oneself. Just as God

knows the universe because he created it, humans can know their own works, but they cannot know nature or know themselves, only their history.

The identity between explanatory knowledge of *x* and direct experience of the causes that have brought about *x* (the *Verum et factum convertuntur* hypothesis) is the great principle of the *nuova scienza* (new science) which justifies including Vico in the history of the contemporary hermeneutic movement. In his main works *De antiquissima Italorum sapientia* (1710), and in *Scienza nova* (which went to three editions), Vico outlines the foundations of historical science. Against Descartes' followers, he extols the superiority of both historical-juridical studies and of the rhetoric over the exact sciences. History he divides into three eras: the age of gods (when imagination plays an important part in the origin of language), the age of heroes, and the age of humans. These three phases are cyclical, so human history is a repetition of historical phenomena, guided by a providence that makes it 'a reasoned civil theology of the divine providence'.

Mario Pagano, a follower of Vico, was representative of the Neapolitan Enlightenment that opened up to European culture from the middle of the eighteenth century. Traces of Rousseau are evident in his *Saggi politici (Political Essays)*, just as echoes of Montesquieu can be found in Gaetano Filangieri's *Scienza della legislazione (Science of Legislation)*. The high opinion in which these men are held by J. Schumpeter (he gives a place of honour in the field of pre-Smith systemizers to Italian economists of the eighteenth century), is due to their analytical capacity and to their interest in a civil economy which reconciles 'public good' and 'utilitarian happiness' in the concept of 'public happiness'. Many of these economists were in public employment as ambassadors and administrators, for example L.A. Muratori, author of *Della pubblica felicità (Concerning Public Happiness)*; Antonio Genovesi, who in his *Meditazioni filosofiche sulla religione e sulla morale (Philosophical Meditations on Religion and Morals)* expounded an ethical concept inspired by Condillac and Helvetius; and Ferdinando Galiani, author of the treatise *Della moneta (On Money)*.

The influence of the French Enlightenment was strong in the Neapolitan School (see Enlightenment, continental). The Italian translation of the Encylopédie was published in Lucca and Livorno between 1758 and 1779. Lombardy was another centre for the diffusion of Enlightenment thought. Its geographical position and economic and political situation (it was part of the Austro-Hungarian Empire, whose rulers Maria Theresa and Joseph II were among the more enlightened sovereigns), placed it in a strategic position for contact with the rest of Europe. Gathered around the 'Società dei Pugni' (Society of Fists) founded in 1761, whose mouthpiece was 'Il Caffé' (a newspaper inspired by England's 'Spectator'), the exponents of the Enlightenment in Lombardy were, like those in Naples, mainly interested in economic and political studies. Pietro Verri's *Discorso sulla felicità (Discourse on Happiness)* (1763) proposed an ethical theory which merged sensationalistic and utilitarian themes; Cesare Beccaria, author of the well-known *Dei delitti e delle pene (On crimes and punishments)* (1764) which was condemned and banned by the Catholic Church in 1766, questioned the justice and use of the death penalty and of torture. For him punishment must defend public welfare - punishment is just only when it guarantees the inviolability and freedom of the people.

2 The nineteenth century

During the nineteenth century, philosophy in Italy was closely connected to political events in which most philosophers played an active part. The influence of Vico was especially strong and, due to Vincenzo Cuoco, permeated even the Milanese school which traditionally tended more towards the Enlightenment. The attention to historical detail and to Italian tradition which are evident in Cuoco's work *Platone in Italia (Plato in Italy)* (1805) was also characteristic of the work of Carlo Cattaneo, a proponent of Federalism along with Giuseppe Ferrari. But Cattaneo's work is more philosophically aware of wider issues in European culture. He was the author of historical and economic studies (in 1844 he predicted the famine that was to hit Ireland during 1845-8) and the driving force behind the group based around the journal *Il Politecnico*, which he also managed on many occasions. His original theory of knowledge, outlined in the *Psicologia delle menti associate (Psychology of associated minds)* (1859-66), justifies Kant's theory of phenomena in terms of historical development and the efficacy of science. Works closer to Enlightenment thought from this time include those of Francesco Soave, critic of Kantianism; Melchiorre Gioia who, in *Filosofia della statistica (Philosophy of Statistics)* (1826), worked out an economic theory influenced by Bentham; and Giandomenco Romagnosi who put forward a naturalistic conception of society.

The major European philosophies of the time - Kantianism and Idealism - were combined in Italy with elements

derived from the long-standing humanist and religious traditions. Pasquale Galluppi contributed to the spread of the philosophy of Kant, especially in Naples (which later became an important centre for Hegelian philosophy). In his *Saggio filosofico sulla critica della conoscenza (Philosophical essay on the critique of knowledge)* (1819), Galluppi maintained the necessity of going beyond sensationalism (such as that of Condillac) and Kantian subjectivism, but his critics charged him with falling into an idealism more inconsistent than that of Kant.

Strongly spiritualistic elements are found in the romantic idealism of authors such as Giuseppe Mazzini, Antonio Rosmini and Vincenzo Gioberti. Mazzini advocated ideas that inspired the struggle for national unity (*Risorgimento*), and the slogan '*Dio e popolo*' (God and the people) summarizes his thought: supreme authority is of the people, but the aims they pursue are inspired by God. The Italian people, he believed, had been called to begin a new era founded not on rights, like the French Revolution, but on duties, on the awareness that each person belongs to Humanity. Mazzini, an opponent of Socialist International, proposed a lay spiritualist philosophy and attempted to give it European significance by creating an association called '*Giovane Europa*' (Young Europe), following the domestic '*Giovane Italia*' movement. The philosophy of Antonio Rosmini is even more strongly spiritualist (see Rosmini-Serbati, A.). A priest, he elaborated a philosophy (suspected of being heterodox) which was meant to supersede that of Kant. He developed an ontology founded on the primacy of the idea of being as prior to any other knowledge or category. The sole category is possibility and knowledge is rooted in consciousness of self (*Nuovo saggio sull'origine delle idee (New essay on the origin of ideas)* (1830); *Logica (Logic)* (1854)).

If, in spite of his polemics, Rosmini is considered the Italian Kant, Vincenzo Gioberti is the Italian Hegel. A critic of Rosmini, Gioberti summarized his own philosophy with the formula '*L'ente crea l'esistente, l'esistente ritorna all'ente*' (being creates existence, existence returns to being). This describes a process of imitation and participation clearly inspired by Neoplatonism, which brought accusations of immanentism. Also a priest, Gioberti like Rosmini was motivated by an apologetical intention, but his Catholic philosophy does have some original points. Apart from strictly philosophical works such as *Degli errori filosofici di A. Rosmini (On the philosophical errors of A. Rosmini)* (1841) and *Protologia (Protology)* (1857), Gioberti is also remembered for his civil commitment and political theories. In *Del primate morale e civil degli italiani (On the moral and civic superiority of the Italians)* (1842-3) he supports a neo-Guelphian idea which sees the Roman Catholic Church as the guide of the Italian people, helping them to regain their historical pre-eminence. Rosmini's and Gioberti's Catholic spirituality met with hostility from the Church which, in the 1879 encyclical *Aeterni Patris* of Leo XIII, declared the philosophy of Thomas Aquinas to be the orthodox doctrine of the Roman Catholic Church. This date marks the beginning of neo-scholastic philosophy which became widespread in the twentieth century, especially at the Pontifical University of Rome and Catholic University of Milan.

The legacy of the Enlightenment continued, particularly in the positivist school in the North which comprised more scientists than philosophers, and which was interested in the 'sciences of life', by which was meant anthropology, psychology, sociology and so on. The major figure of this movement was Roberto Ardigò, an ex-priest and academic at Padua (a well-known centre for heterodoxy since the Renaissance). He wrote an essay on Pomponazzi and maintained a naturalistic positivism which was a cross between Spencer's Evolutionism (Spencer was the best-known positivist philosopher in Italy) and Bruno's Naturalism. For Ardigò, the fact is divine, the absolute to which every theory must be referred. Although not without a certain dogmatism, this theory is more radical than Spencer's because it refuses to recognize the unknowable. Ardigò's work on ethics, *La morale dei positivisti (The morality of positivists)* (1879), met with great success, especially in the field of criminal law, while his *Psicologia come scienza positiva (Psychology as a positive science)* (1870) is important in the development of psychology as an autonomous science.

Naples was the centre of Hegelianism in Italy, and two of the most influential Italian philosophers of the beginning of the twentieth century, Croce and Gentile, were educated there. Hegelianism in Italy is not regarded as an imported school of thought - rather, the roots of European philosophy are sought in the Italian and especially the Neapolitan tradition. Bertrando Spaventa's theory of the circulation of ideas, outlined in his *La filosofia italiana nelle sue relazioni con la filosofia europea (Italian philosophy and its relation to European philosophy)* (1862), maintains that the origin of modern philosophy is to be found in the Italian Renaissance: Spinoza, Kant, Fichte and Hegel he regards as disciples of Bruno, Campanella and Vico. This interpretation of history, in spite of its one-sidedness (it ignores Galileo and the Enlightenment), stimulated important historical studies, especially on the

Renaissance and on German philosophy which was seen as the link with the Renaissance. Such one-sidedness is typical of Italian philosophy of the nineteenth century, where Positivists and Idealists alike viewed theoretical progress in science with indifference, leaving thinkers of European stature practically isolated: these included Giuseppe Peano, for instance, who completed the work of Weierstrass and whose discoveries in mathematics and geometry place him among the greatest scientists of the century; and Federigo Enriques, the greatest representative of the Italian school of algebraic geometry and supporter of an epistemological theory similar to that of Lakatos (see Lakatos, I.).

3 The twentieth century

In the early twentieth century, Italian philosophy was dominated by a lively anti-positivist controversy, led by Idealist, Marxist and by Pragmatic thinkers. The major figures of neo-Idealism were Benedetto Croce and Giovanni Gentile, both committed to reforming Hegelianism. Initially close to Marxism, Croce later embraced a philosophy of Spirit clearly of Hegelian stamp. For the triad of the dialectic movement (thesis, antithesis and synthesis), Croce substituted a dialectic of opposites articulated in four distinct categories: aesthetics, theoretics, economics and ethics. The first two make up theoretical activity, the others the practical *(Logica come scienza del concetto puro (Logic as the science of pure concept)* (1905); *Filosofia della pratica, economia e etica (Philosophy of practice, economics and ethics)* (1909)). The distinct categories are mutually irreducible, though they are not independent. Croce is especially famous for his aesthetic theory, outlined in *Estetica come scienza dell'espressione e Linguistica generale (Aesthetics as the science of expression and general linguistics)* (1902), which was founded on the identification of both intuition and expression. He also provoked philosophical debate through the journal *La Critica*, a forum for cultural, civil and social discussion which was open to European influences.

If the Idealism of Croce is characterized by a devaluation of scientific thought (whose concepts he regarded as 'pseudo-concepts'), the Idealism of Giovanni Gentile classified science in the dogmatic manner of Fichte. The reform of Hegelianism proposed by Gentile in his *Teoria generale dello spirito come atto puro (General theory of the spirit as pure act)* (1916) and *Sistema di logica (System of logic)* (1917-22) eliminates any presupposition (both logic and philosophy of nature) of the life of the spirit. The life of the spirit is consequently reduced to pure act - beyond the actuality of thought there is nothing. As in Fichte, the ego is self-creation. Whereas Croce viewed philosophy as history in a wide sense (economic, political and so on), for Gentile philosophy is merely the history of thought, it is the history of philosophy and the history of the spirit is its own education. As Minister for Education in the Fascist Government Gentile had enormous influence on Italian culture. He was instrumental in the education reforms of 1924 and directed the *Enciclopedia Italiana*, one of the greatest productions of Italian culture from that time. Gentile's involvement with Fascism, however, caused a bitter rift with Croce, who had distanced himself from Mussolini. Similarly, Piero Martinetti was strongly anti-Fascist. He reinterpreted Kant's philosophy in Platonic and Spiritualistic terms and, arguing against positivism, he maintained the superiority of a philosophy whose result is faith, which he regarded as the most radical fruit of reason. Giovanni Vailati also argued against positivism: his pragmatism is independent of the corresponding American movement and is original in its attention to language through the study of semantic and syntactic structure, and the demand for logical rigour as a tool for conceptual clarification.

The prevailing climate of Idealism at the beginning of the twentieth century meant that Marxism had little support in Italy. It is thanks to Antonio Labriola that the philosophies of Marx and Engels became known, thereby opening a debate with Positivism and Idealism. A pupil of Spaventa, Labriola developed a philosophy whose central element is a social psychology which considers the ego not in an abstract sense but in the context of its historical condition. Only after the Second World War did Marxism permeate cultural life more deeply due to the publication of the works of Antonio Gramsci. A vigorous opponent of Fascism and a founder of the Italian Communist Party, Gramsci was imprisoned and wrote the majority of his works while thus incarcerated. These were published posthumously under the title *Quaderni dal carcere (Notebooks from Prison)* (1948-51). His philosophy is a philosophy of practice - in opposition to the speculative historicism of Croce, it eliminates all transcendency and thus is absolute Historicism and Humanism. The intellectual is not separated from the rest of society (a renaissance ideal still valid for Croce and Gentile), but rooted in it, an 'organic intellectual' with a fundamental role to play in the revolution. Gramsci reversed the Marxist relation between structure and superstructure. He regarded it as the duty of intellectuals to guide the masses to the revolution, to permeate civilian

society, and to undertake a role of cultural hegemony in the awareness that the Party is the ‘modern Prince’. Unlike Machiavelli, for Gramsci this prince is merely a body expressing a collective will. The influence of Lenin is evident in the demand for a synthesis between theory and practice, the duty to inaugurate a new society falling on intellectuals and on the Party (see Lenin, V.I.).

After the Second World War, Italian philosophy became more open to contemporary European culture, especially to German phenomenology and hermeneutic existentialism. This phase was dominated by the Turin school, where some of the major present-day Italian philosophers taught or were educated. Nicola Abbagnano was among the first Italians to develop existentialist themes, but was also known for his historical studies on ancient scepticism and Hume. His ‘positive’ existentialism, which is strongly influenced by Dewey’s Pragmatism, regards existence as a possibility or project within a finite horizon. The existentialism of Luigi Pareyson has personal and hermeneutical elements as outlined in his *Verità e Interpretazione (Truth and interpretation)* (1970): the human person is an organ of truth, which is interpretation, although not exhausting itself in interpretation. These themes were developed towards a theory of ‘formativeness’ in Pareyson’s aesthetics, whereby artistic activity becomes object and manner of its own action (*Estetica, Teoria della formatività (Aesthetics: A Theory of Formativeness)* (1954)). The final phase of his philosophy is strongly religious, offering a meditation on mythical and revelatory language.

Norberto Bobbio, a political philosopher initially closer to phenomenology, has moved towards Anglo-American trends, from the analytical philosophy expressed in his *Giusnaturalismo e positivismo giuridico (Natural law doctrine and legal positivism)* (1964) to the formalism of Kelsen which he revised in a functionalist manner more appropriate to the description of democratic societies in *Dalla struttura alla funzione (From structure to function)* (1977). Well-known for his anti-Fascist views and for his civic commitment (he was made a senator for life), Bobbio represents a new spirit of enlightenment. He has contributed to widening the horizons of political studies in Italy, freeing them from Idealism, and has contributed greatly to the theory of law with works such as *Teoria della norma giuridica (Legal Theory)* (1968), *La teoria delle forme di governo (Theory of the forms of government)* (1976), and *Destra e sinistra (Right and left)* (1994).

The founder of the phenomenological school in Italy is Enzo Paci whose thought centres mainly on Husserl’s ideas, trying to bridge the gap between the categorial and pre-categorial world. Umberto Eco, a pupil of Pareyson and professor of semiotics at Bologna, is well-known not only as a philosopher but also as a writer (*Il nome della rosa (The Name of the Rose)* is his most famous novel). Applying Pareyson’s aesthetic theories to modern art, Eco has developed a semiological theory which sees meaning as indefinite and open (*Opera aperta (Open Work)* (1962)), which does not mean absent, as he particularly points out in his recent works against American deconstructionism, including *I limiti della interpretazione (The Limits of Interpretation)* (1990).

Another pupil of Pareyson is Gianni Vattimo, a professor in Turin and Italy’s most important representative of hermeneutic philosophy based on Heidegger and Gadamer. In works such as *La fine della modernità (The end of modernity)* (1985), Vattimo regards hermeneutics as the philosophy consequent upon the end of metaphysics and modernity. The acknowledgement of the end of foundational systems is seen to bring a liberating and emancipating effect (*La società trasparente (Transparent society)* (1989)). His hermeneutic way of thinking follows Nietzsche and Heidegger: *Pensiero debole (Weak Thought)* (1983) posits the end of the stable structure of being, noting that any relation to being is within linguistic boundaries which are historically determined.

The philosophies of Emanuele Severino and Massimo Cacciari (both professors at Venice) are developed on original lines. Severino criticizes the nihilism of Western philosophy which, by reducing being to nothing (going from being to becoming), creates a philosophical justification for its project of domination, whose final outcome is technology (*Essenza del nichilismo (The Essence of Nihilism)* (1972)). Against this tendency Severino proposes a return to Parmenides, to an ontology of identity that unmasks the illusion of becoming and makes it possible to act free from domination. Through an original interpretation of Nietzsche, Heidegger and Wittgenstein, Cacciari sees in ‘negative thought’ (technology and conventionalism) the origin of the modern crisis of foundations, whose outcome is disenchantment and whose theoretical premises are found in the religious tradition of the West. His works include *Krisis* (1976), *L’angelo necessario (The necessary angel)* (1986), and *Dell’inizio (On origins)* (1990).

Italian philosophy has always considered philosophical movements and fields such as empiricism, analytical

philosophy, logic and philosophy of science to be of minor importance, its strong humanist and historical tradition aligning more with French and German thought. This has become less true in recent times. The example of Ludovico Geymonat, who held the first chair of Philosophy of Science in Milan, is indicative. Having studied with Reichenbach, Schlick and Carnap, Geymonat developed an epistemological theory sensitive to the historical evolution of science, attempting to bridge the traditional gap between humanist and scientific culture. His studies of Galileo and of philosophical and scientific thought are also directed to this end.

Itō Jinsai (1627-1705)

Itō Jinsai, along with his contemporary Yamaga Sokō, pioneered the kogaku, *or 'Ancient Learning', philosophical movement of Tokugawa Japan.* Kogaku *reacted against the allegedly stifling and excessively metaphysical ideas of Zhu Xi's neo-Confucianism. In making his call for a return to the ancient Confucian teachings, Jinsai produced one of the first and most systematic visions of Confucian philosophy.*

A lifelong resident of Kyoto, the imperial capital, Jinsai made his call for a return to the ancient Confucian teachings of the *Analects* and the *Mengzi* (see Confucius; Mencius) in isolation from the *samurai* regime based in Edo (now Tokyo). He published little in his day, being content with a life of dignified poverty teaching numerous students, including townspeople and court nobles, at his *Kogidō*, or 'School of Ancient Semantics'. Nevertheless, Jinsai's ideas circulated nationally through pirated editions of his writings. One such unauthorized publication sparked the interest of Ogyū Sorai, then living in Edo, in *kogaku*. Ogyū Sorai wrote to Jinsai, praising his ideas and requesting a teacher-disciple relationship, but Jinsai, then within a year of his own death, never responded. About a decade later, Ogyū Sorai formulated his own *kogaku* system, which systematically attacked Jinsai's ideas even as it advanced upon the trail Jinsai had blazed. Despite Ogyū Sorai's critiques, Jinsai's ideas, as popularized and published by his son and successor Itō Tōgai, prevailed in the eighteenth century as the most humane variety of classical Confucianism.

Jinsai's philological methodology derived largely from the *Xingli ziyi (The Meanings of Neo-Confucian Terms)* of Chen Beixi (1159-1223), a philosophical lexicon systematically defining some twenty-five key concepts as understood by Zhu Xi, the master synthesizer of neo-Confucian philosophy in East Asia. The *Xingli ziyi*, first promoted in Japan by Hayashi Razan (1583-1657), appeared in several seventeenth-century editions as Tokugawa scholars sought to fathom the new metaphysical philosophy of neo-Confucianism. No sooner had Chen Beixi's lexicon conveyed the essence of Zhu Xi's ideas, than its philologico-lexicographical methodology gave rise to systematic critiques of Zhu Xi's philosophical semantics by Sokō, Jinsai and then Sorai.

Jinsai's *Gomōjigi (The Meanings of Terms in the Analects and the Mencius)* was patterned after the *Xingli ziyi*. The word *jigi* in Jinsai's title is the Japanese for *ziyi* (the meanings of terms), part of Chen Beixi's title. However, the *Gomōjigi* repeatedly criticizes Chen Beixi, taking issue with him even as it appropriates his methods. Themes developed in the *Gomōjigi* owe much to the ideas of Luo Qinshun (1465-1547), a Ming dynasty scholar who espoused loyalty to Zhu Xi's neo-Confucianism even while criticizing it. The critiques of Luo Qinshun and Jinsai in turn reflected Zhu Xi's open-minded call for critical scrutiny in philosophy. The *Jinsilu (Reflections on Things at Hand)*, edited by Zhu Xi, quips, 'By doubting the indubitable, one greatly advances'.

Jinsai's ideas ultimately transcended their Chinese sources, producing one of the first and most systematic, philologically-based visions of Confucian philosophy ever articulated in East Asian intellectual history. Japanese scholars often note that Jinsai's ideas predated, by nearly a century, those of Dai Zhen, the famed Qing dynasty scholar of 'Evidential Learning' whose critiques of Zhu Xi took much the same form as those of Jinsai.

Breaking with the neo-Confucian dualism of principle and material force, Jinsai proclaimed that all things consist of a unitary, primal material force, and that alone. His metaphysics assumed vivacious activity, unlike Zhu Xi who claimed that the original nature of humanity could only be glimpsed in quietistic meditation (see Xing). Jinsai saw the human mind as an energetic, active endowment, not as a quiescent, motionless entity (see Mind, philosophy of; Xin). He valued human feelings, contending that they are the innate roots of moral behaviour. He praised *jin*, or empathetic moral concern, along with other ancient Confucian virtues as integral elements of *michi*, or the true Way of human conduct. Perfection of the latter made one a gentleman, the ideal proffered by Jinsai in place of Zhu Xi's notion of sagehood. Religiously, Jinsai did affirm the neo-Confucian line in explaining ghosts and spirits as the activities of the psycho-material forces of *yin* and *yang* (see Yin-yang). Though generally a tolerant and broadminded thinker, Jinsai argued in a famous essay that the *Daxue (Great Learning)* was not an authentic Confucian text because it devalued the emotions in ways that Confucius never had (see Daxue).

Jacobi, Friedrich Heinrich (1743-1819)

Polemicist and literary figure, Jacobi was an outspoken and effective defender of individualism. He accused philosophers of conceptualizing existence according to the requirements of explanation, thus allowing no room for individual freedom or for a personal God. In a series of polemics that influenced the reception of Kant, Jacobi applied his formula, 'Consistent philosophy is Spinozist, hence pantheist, fatalist and atheist', first to Enlightenment philosophy and then to idealism. Jacobi was not however opposed to reason; in 'faith' and 'feeling' he sought to recover the intuitive power of reason philosophers ignored.

Jacobi also criticized the literary movement spearheaded by the young Goethe, because of its latent fatalism. He dramatized in two novels the problem of reconciling individualism with social obligations. An exponent of British economic and political liberalism, Jacobi was an early critic of the French revolution which he considered the product of rationalism.

1 Life and work

Born in Düsseldorf, of well-to-do merchant family, Jacobi studied in Geneva where he became acquainted with Rousseau and Bonnet. Destined to a business career, after marrying Elisabeth (Betty) von Clermont he entrusted his affairs to his brother-in-law and dedicated himself to literary and social activities. Together with Betty he made his villa at Pempelfort a meeting place for the personalities of the day and a centre of liberal ideas. He was instrumental to the founding of the journal *der Teutsche Merkur*. In the 1770s he held political positions in the duchies of Julich-Berg and, briefly in 1779, in Bavaria. In 1805 he moved to Munich to take up the post of president of the Academy. He spent his last years there, supervising the edition of his works.

Widely regarded as an anti-Enlightenment figure in his own lifetime and afterwards, Jacobi in fact sought to defend individualistic values which were just as much part of the Enlightenment as the rationalism he fought all his life. He claimed that philosophy artificially abstracts from the individuality of existence yet takes its empty conceptual artifacts to define reality itself. For the sake of explanation philosophy subordinates conditions of existence to conditions of thought, thereby subverting the possibility of choice and action. Hence Jacobi accused philosophy of 'nihilism' (a term he popularized).

2 Critique of philosophy

In a masterstroke of philosophical propaganda, Jacobi propelled his position (and himself) to the centre of attention in 1785, by publishing with commentary letters he had recently exchanged with Moses Mendelssohn (*Concerning the Doctrine of Spinoza in Letters to Herr Moses Mendelssohn*; second, much enlarged edition, 1789) (see Mendelssohn, M.). The purpose of the correspondence had been to clarify Lessing's declaration, allegedly made to Jacobi in a conversation shortly before Lessing's death, that he was a Spinozist (see Lessing, G.E.; Spinoza, B. de). In that conversation Jacobi had claimed that philosophy inexorably leads to Spinoza's 'substance', and this abstract concept, when set up as first principle, undermines individual distinctions, most of all the distinction between God and creatures. Lessing had responded by declaring his sympathy for Spinoza, and Jacobi had thereupon urged him to perform a *salto mortale* - a spiritual somersault in virtue of which, through an act of faith, Lessing would simply declare himself *for* a personal God, and *for* freedom, and thereby rejoin common sense.

The book caused an uproar. Jacobi had succeeded in dramatizing his cause against philosophy by identifying the latter with Spinozism (widely regarded at the time as synonymous with atheism), and, by associating Spinoza with Lessing, he had cast doubt on Lessing's typical Enlightenment belief that reason can save the essential truths of religion and morality. Jacobi had at the same time challenged the authority of Mendelssohn, universally acknowledged as Lessing's intimate friend and a witness to reason's ability to establish truths transcending ethnic and religious differences. The equation Jacobi then drew, 'Consistent philosophyČequals;SpinozismČequals;pantheismČequals;fatalismČequals;atheism', is one he defended to the end, although he soon had to adapt it to the idealism of Kant and his followers.

3 Critique of idealism

Jacobi's objections to Kant's critique of reason became commonplace in the sceptical reaction to Kant (see the

Appendix to *David Hume on Faith, or Idealism and Realism: A Dialogue*, 1787). Jacobi argued that it is inconsistent to accept the 'thing in itself' yet disclaim knowledge of it; that in a priori 'space-time' the individuality of determination is a mere illusion; that the categories are empty forms artificially imposed upon experience, and the transcendental 'I' a counterfeit subject. His later negative reactions to Fichte and Schelling were even stronger. Jacobi accused Fichte of inverted Spinozism - of parading as 'subject' and 'subjectivity' an indeterminate source of activity (the self-positing 'I') in fact just as anonymous and impervious to individuation as Spinoza's substance. He made this accusation in *Jacobi to Fichte* (1799), at a time when Fichte was under suspicion of atheism. The attack on Schelling - fellow member of the Munich Academy whose views on art and nature Jacobi feared would corrupt the young - came in 1811 (*Of Divine Things and Their Revelation*). The ensuing bitter public debate is known as the 'pantheism dispute'.

4 Positive doctrine

Despite his polemics, Jacobi insisted that he was not against reason but that, on the contrary, his aim was to unmask the irrationalism latent in rationalistic philosophy. In *David Hume* - philosophically his most interesting work - he claimed that he used 'faith' in the sense of Hume's 'belief' (both *Glaube* in German). He however rejected Hume's phenomenalism and in the same work defended a realism of the senses not unlike that of Thomas Reid (by whom he was influenced, as also by Adam Ferguson). He concluded with the suggestion that reason is a higher and more reflective form of sensibility - a position which Jacobi associated with Leibniz and which had obvious vitalistic implications. Yet Jacobi later rejected the vitalism of Herder because of its pantheism (Appendices IV-V to *Doctrine of Spinoza*, 1789).

Jacobi's ambiguity towards philosophy - to which he was attracted but which he feared because of its possible nihilistic effects - was reflected in his attitude to the philosophers he criticized. He admired Spinoza for his consistency and his recognition that truth is selfrevelatory (hence transcends ratiocination). He felt kinship with Kant, with whom he shared belief in the priority of existence over thought and in the finitude of reason. Retrospectively he used Kant's distinction between reason and understanding to define what he had always meant by 'faith' or the 'feeling for truth'. He identified the 'reason' he had criticized as Kant's 'understanding'- a faculty by nature bent on cataloguing and exploiting finite, sensible things. But above understanding there is true reason with its intuitive power to apprehend higher moral truths. By 'faith', Jacobi claimed, he had always meant this true reason. Kant had rightly distinguished it from understanding but had failed to recognize its intuitive power, thereby subordinating it to understanding ('On the Undertaking of Critique to Reduce Reason to the Understanding', 1802). Jacobi also hinted that in his *David Hume* he had offered an alternative to Kant's deduction of the categories, and that Kant had based his refutation of idealism on his own early claim that no 'I' is possible without a 'Thou'. Despite ambiguities and fluctuations, Jacobi always defended his two fundamental theses: (1) Existence is radically individualized and precedes thought possibilities; (2) Truth is selfrevelatory and is best intuited in the relations between individuals and between individuals and their God.

5 Literary work

Inspired by Goethe, with whom he had a long but uneven relationship, Jacobi wrote two novels which he published, beginning in 1775, under various forms: *Allwill*, (final form 1792) and *Woldemar* (final form 1796). Goethe had also figured in Jacobi's report of his controversial conversation with Lessing and, implicitly, was just as much a target of attack in the ensuing controversy as Mendelssohn. Jacobi feared Goethe's enthusiasm for Spinoza, and the literary glorification of nature he promoted. In *Allwill* he portrayed the seductive and ultimately destructive effects of a lively poetic imagination undisciplined by social and moral constrains. In *Woldemar* he explored the problem of balancing nature with art and virtue, and of establishing social bonds between individuals richly endowed with subjectivity. The man-woman relationship theme is central to both novels.

6 Political ideas

In early essays Jacobi defended free trade and attacked the theorists of state absolute power. Passionately interested in anything political, he criticized the French revolution which he regarded as an unrealistic attempt to reshape human institutions to suit abstract reason, without regard for history or nature.

7 Influence

Jacobi's personalism and his religiosity (which drew inspiration from many sources, notably Hamann) had wide influence. In his early *Kantian Letters* Reinhold cast Kant in the role of mediator between Mendelssohn's reason and Jacobi's faith, with far-reaching consequences for the reception of Kant. Jacobi's influence also spread through personal contacts and a voluminous correspondence. Although not himself a product of pietism, late in his life Jacobi inspired pietist educated writers such as Schleiermacher and Fries, and through their writings his influence passed on to the nineteenth century (see Pietism).

GEORGE DI GIOVANNI

List of works

Jacobi, F.H. (1785) *Über die Lehre von Spinoza an den Herrn Moses Mendelssohn (Concerning the Doctrine of Spinoza in Letters to Herr Moses Mendelssohn)*, Breslau: Löwe; 2nd edn, 1789; repr. in H. Scholz (ed.) *Die Hauptschriften zum Pantheismusstreit zwischen Jacobi und Mendelssohn*, Berlin: Reuther & Reichard, 1916. (1789 edition is much enlarged. 1916 edition also contains other writings relating to the Jacobi-Mendelssohn controversy.)

Jacobi, F.H. (1787) *David Hume über den Glauben, oder Idealismus und Realismus. Ein Gespräch (David Hume on Faith, or Idealism and Realism: A Dialogue)*, Breslau: Löwe; 2nd edn, 1815; 1st edn repr. New York and London: Garland, 1983.(1815 edition was part of the *Werke* and was significantly edited, with a new lengthy introduction. 1983 edition includes this 1815 new Preface, with an English introduction by Hamilton Beck.)

Jacobi, F.H. (1792) *Eduard Allwills Briefsammlung, herausgegeben von Friedrich Heinrich Jacobi, mit einer Zugabe von eigenen Briefen (Edward Allwill's Collection of Letters, edited by Friedrich Heinrich Jacobi, with an Addition from Letters of His Own)*, Königsberg: Nicolovius; repr. J.U. Terpstra (ed.), Groningen: Djakarta, 1957.(This is the final text of a novel, parts of which had previously been published starting from 1775. 1957 edition is a critical edition.)

Jacobi, F.H. (1796) *Woldemar*, Königsberg: Nicolovius.(This is a somewhat edited version of the 1794 final text of a novel, parts of which had previously been published starting from 1779.)

Jacobi, F.H. (1799) *Jacobi an Fichte (Jacobi to Fichte)*, Hamburg: Perthes; repr. in R. Lauth and H. Gliwitzky (eds) (1972) *Fichte-Gesamtausgabe*, Stuttgart and Bad Cannstat: Frommann, series 3, vol. 3.(An open letter to Fichte publicly rejecting his idealism. 1972 edition is a critical edition.)

Jacobi, F.H. (1802) 'Über das Unternehmen des Kriticismus, die Vernunft zu Verstande zu bringen, und der Philosophie überhaupt eine neue Absicht zu geben' (On the Undertaking of Critique to Reduce Reason to the Understanding, and to Give a New Purpose to Philosophy in General), in *Beyträge zur leichtern übersicht des Zustandes der Philosophie beym Anfange des 19. Jahrhunderts* 3: 1-110.(The Beyträge were a series of volumes edited by K.L. Reinhold.)

Jacobi, F.H. (1811) *Von den Göttlichen Dingen und ihrer Offenbarung (Of Divine Things and Their Revelation)*, Leipzig: Fleischer; repr. in W. Weischedel (ed.) (1967) *Streit um die göttlichen Dinge. Die Auseinandersetzung zwischen Jacobi und Schelling*, Darmstadt: Wissenschaftliche Buchgesellschaft.(Jacobi's attack on Schelling. 1967 edition includes other writings relating to the Jacobi-Schelling controversy.)

Jacobi, F.H. (1812-25) *Friedrich Heinrich Jacobi's Werke*, eds J.F. Köppen and C.J.F. Roth, Leipzig: Fleischer, 6 vols; easily available in photo-mechanical reproduction, Darmstadt: Wissenschaftliche Buchgesellschaft, 1968. (1812-25 edition was supervised by Jacobi before his death. It is not reliable as a document of Jacobi's earlier production.)

Brüggen, M. and Sudhof, S. (eds) (1981-) *Briefwechsel*, Stuttgart and Bad Constatt: Frommann-Holzboog.(The first volumes of a projected critical edition so far covering the early correspondence. Published to date: part 1, vols 1-3, part 2, vol. 1.)

di Giovanni, G. (ed. and trans.) (1994) *The Main Philosophical Writings and the Novel 'Allwill'*, Kingston and Montreal: McGill-Queen.(It includes complete translations of *Concerning the Doctrine of Spinoza* (1785), *David Hume* (1787), *Allwill, Jacobi to Fichte*, the introduction to the *David Hume* of 1815, and excerpts from other works. It also includes a long study on Jacobi and his age, and a detailed bibliography.)

Jaina philosophy

The issues in Jaina philosophy developed concurrently with those that emerged in Buddhist and Hindu philosophy. The period from the second century BC *to about the tenth century* AD *evinces a tremendous interaction between the schools of thought and even an exchange of ideas, borne out especially in the rich commentary literature on the basic philosophical works of the respective systems. Jaina philosophy shares with Buddhism and Hinduism the aim of striving, within its own metaphysical presuppositions, for absolute liberation (*mokṣa *or* nirvāṇa*) from the factors which bind human existence. For the philosophical systems of Indian thought, ignorance (of one's own nature, of the nature of the world and of one's role in the world) is one of the chief such factors, and Jainism offers its own insights into what constitutes the knowledge that has the soteriological function of overcoming ignorance. Jainism is not exempt from the problem of distinguishing the religious and/or mystical from the 'philosophical'; the Indian tradition has no exact equivalents for these categories as they are usually employed in Western thought.*

The significance ascribed to knowledge is reflected in the attention given to epistemology and logic by Jaina philosophers. The first systematic account was given by the fourth- or fifth-century philosopher Umāsvāti, who distinguished two types of knowledge: partial knowledge, which is obtained from particular standpoints, and comprehensive knowledge, which is of five kinds - sensory knowledge, scriptural knowledge, clairvoyance, telepathy and omniscience. Of these, the first two are held to be indirect (consisting in, or analogous to, inference) and the remainder are direct; Jainism is unique among Indian philosophies in characterizing sensory knowledge as indirect. The aim of the treatises on knowledge is to present what the Jainas believe would be known in the state of omniscience, as taught by Mahāvīra. Omniscience is an intrinsic condition of all souls; however, due to the influence of karma since beginningless time this essential quality of the soul is inhibited.

The Jaina interest in logic arose, as with the other schools, through a consideration of inference as a mode of knowledge. The methods and terminology of the Nyāya school were heavily drawn upon; this is evident in Siddhasena Divākara's Nyāyāvatāra (The Descent of Logic) (c. *fifth century), one of the first detailed presentations of Jaina logic. The Jainas used logic to criticize other schools and defend their own. The acquaintance with other traditions that this implies is a notable aspect of classical Jainism; their interest in other schools, coupled with their belief in collecting and preserving manuscripts, makes the Jaina corpus very important for the study of classical Indian thought.*

According to Jaina ontology, reality is divided into the two basic principles of sentience and non-sentience, neither of which is reducible to the other. The former is manifested in souls, of which there are an infinite number, and the latter in the five basic substances, which are matter, dharma *and* adharma *(factors posited to explain movement and rest), space and time. Matter consists of atoms; as it becomes associated with the soul, it gets attached to it, becomes transformed into karma and thereby restricts the functions of consciousness. This pernicious process can only be reversed through ascetic practices, which ultimately lead to liberation.*

Ascetic practices constitute the basis of Jaina ethics, the framework of which are the 'five great vows', according to which the ascetics vow to live. These are: nonviolence towards all forms of life, abstinence from lying, not taking what is not given, celibacy and renunciation of property. Nonviolence is strongly emphasized, since violence produces the greatest amount of karma. Hence great care has to be exercised at all times, especially because injury of life forms should be avoided also in plants, water, fire, etc. The minimization of physical activity to avoid injury is therefore an important ideal of Jaina asceticism. Inspiration for constant ethical behaviour is provided by a contemplation of the lives of the twenty-four Jinas, of whom Mahāvīra was the last. Though human, these 'conquerors of the passions' are worshipped as divine beings because of their conduct in the world and knowledge of the nature of ultimate reality.

1 Ontology and metaphysics

Jaina thought has retained several elements of ancient natural philosophy, such as the theory of atoms, explaining the nature of the universe without recourse to a creator god, and the interpretation of karma as particles of subtle matter (see Karma and rebirth, Indian conceptions of §6). The Jainas hold an ancient theory in which ultimate reality is divided into two basic categories, one which represents the principle of sentience or consciousness as

such, usually translated as 'soul' (*jīva*), and one which represents the non-sentient principle (*ajīva*). In their intrinsic natures they are exclusive categories in the sense that, despite their coexistence (as in human beings), the one cannot take on the nature of the other. Both are ontological substances (*dravya*) in that reality or existence as such can ultimately be reduced to these two eternal, uncreated and indestructible categories (see Ontology in Indian philosophy §1). The soul is best described as a monad, of which there are a countless number, each independent but with the same principle of sentience as its chief characteristic, and each able to expand or contract according to the size of the body which it inhabits. Souls intrinsically possess unlimited qualities of bliss and energy, and are omniscient.

The non-sentient principle is a generic term for the following five substances. First, matter (*pudgala*) represents the basic stuff or raw material out of which the universe is composed. Matter is made up of atoms, each of which occupies one point of space, and which can be with or without form and can be inhabited by souls. Objects come into being through a combination or aggregation of atoms and change is explained not through destruction or creation of atoms but as a rearrangement of the basic stuff. Together with the view that atoms can have the qualities of colour, taste, touch and smell, Jaina philosophy evolved the theory of substance, quality and mode (see §4) to explain the world in terms of identity and difference, depending on the standpoint and purpose. Matter is crucial for the philosophical anthropology of Jainism because it is matter that directly affects the nature of the soul in the sense that, by becoming converted into karma, it restricts the intrinsic functions of the soul, inhibiting right faith, right knowledge and right conduct. Precisely how this operates is explained later in this section with reference to the so-called 'seven basic truths' which form the basis of Jaina metaphysics.

The second and third substances, called *dharma* and *adharma*, are posited for technical reasons. They stand respectively for the factors that assist movement and rest, without themselves being set into motion or coming to rest. They are formless, coextensive with worldly space and without qualities. The function of these two substances is usually explained on the analogy of water and fish. Just as water is not responsible for the fish's movement or its being stationary but makes these possible, so too *dharma* and *adharma* offer the condition for the possibility of movement or rest to souls and matter.

The fourth substance, ether or space (*ākāśa*), does not itself occupy space but is space itself, giving the other substances the place they require in which to exist. According to Jaina cosmology, space is the only substance that encompasses both the world (*loka*) and the nonworld (*aloka*). The world is divided into the underworld or hells, in which souls reap the fruits of their unmeritorious deeds, the middle world, which corresponds to our world and in which only human beings can perform the necessary austerities for absolute freedom, the world of different kinds of heaven, in which souls reap the fruits of their meritorious acts and, finally, the world above the heavens, to which a liberated soul (one that has completely rid itself of the burden of all its positive and negative karma) rises, to remain there in its pristine nature. The nonworld serves no purpose at all and is described as being empty. However, it demarcates the area along which liberated souls eternally exist (see Cosmology and cosmogony, Indian theories of §3).

Time (*kāla*) is the fifth non-sentient substance; it has no spatial points, its smallest unit being called a moment (*samaya*), out of which the other units of time - minutes, hours, and so on - are then derived. Time enables change to take place without itself changing. On the absolute level, time exists as an undifferentiated continuum for the liberated souls. On the cosmological level, it has two broad phases or eras, and is described on the analogy of a wheel with twelve spokes. The world goes through six phases of gradual descent, representing the decline of values, then through six phases of gradual ascent, representing a steady improvement of values. Both phases involve fantastic spans of time. The Śvetāmbara tradition hesitates to accord time the status of an independent substance, though it uses it as a category necessary to explain the course of the world. The Digambaras and the Śvetāmbaras, the two main groups of Jainism, differ in several philosophically minor issues.

What the above ontological structure of reality does not do is explain the original cause of the association of the souls with the other substances, and especially how karma originally attaches itself to the soul to its detriment. This problem applies *mutatis mutandis* to all schools of Indian thought which speak of the possibility of liberation from the bondage of karma, where the basic issue is simply presupposed and is either left unanswered or euphemistically avoided by saying, as the Jainas also do, that the association between the souls and the world has been so since beginningless time (*anādi*). The karma theory was accepted a priori without the need to explain a

first cause and the issue does not seem to be regarded as a problem. Moreover, Jainism shares with Buddhism and Hinduism the basic assumption that the human situation is characterized by suffering and pain; more important than seeking the first cause is what can be done to free oneself from this predicament. Past deeds cannot be undone, but once the basic presuppositions are accepted - especially that the process of karma, which is responsible for the cycles of existence, can be interfered with - the individual is free to opt for the path that promises the goal of absolute freedom. The Jainas do not have recourse to a creator god who sets the universe and life in the world in motion. Everything operates through its own inner dynamics and the role of the individual is to meditate on the basic truths of reality.

Jaina metaphysics is based on seven truths or fundamental principles (*tattva*) which are an attempt to explain the human predicament. The first two are the two ontological categories of the soul and the non-soul discussed above, namely the truth that they exist. For the remaining five truths the factor of karma has to be brought into play because all are connected to it. The third truth is that through the interaction, technically called *yoga*, between the two substances, soul and non-soul, matter flows into (*āsrava*) the soul, clings to it, becomes converted into karma and - the fourth truth - acts as a factor of bondage (*bandha*), restricting the manifestation of the consciousness intrinsic to it. The fifth truth states that a stoppage (*saṃvara*) of new karma is possible through asceticism. An intensification of this burns up the existing karma - this sixth truth is expressed by the word *nirjarā*. The final truth is that when the soul is freed from the influence of karma, it reaches the goal of Jaina teaching, which is liberation (*mokṣa*).

It must be noted that the later tradition included two more categories after bondage (*bandha*), namely *puṇya* and *pāpa*, which may be translated as ‘good’ and ’bad’. They refer to two kinds of bondage caused by one’s deeds. The ethical implications of these terms underscore the significance of Jaina ethics for Jaina soteriology.

2 Epistemology and logic

Epistemology and logic are closely linked in the Indian tradition because logical issues are largely associated with problems related to inference which, in turn, is regarded as a means or instrument of knowledge. The occupation with abstract, logical ideas related to inference was the favourite topic of the Nyāya school, particularly in its Navya-Nyāya form, which flourished between about the thirteenth and the seventeenth century. Jaina logic adopts much of the Nyāya language and method (see Nyāya-Vaiśeṣika §6).

The history of Indian logic can be traced back at least to pre-Christian works on Indian medicine in which physicians are advised to know about a long list of categories, epistemological and logical, when participating in public debates. In the commentary literature to the basic philosophical treatises, especially after the third century AD, epistemology takes a prominent position, each school presenting its own theory of knowledge after criticizing other views. Jainism made its own unique contribution to this mainstream development by also occupying itself with the basic epistemological issues, namely, with those concerning the nature of knowledge, how knowledge is derived, and in what way knowledge can be said to be reliable. These issues feature in the Indian context in the form of the consistent attention paid to what exactly constitutes cognition, the means of cognition, and the validity of cognition. The problems dealt with in epistemology broadly served two functions. They represented an attempt to provide the basis for an intelligible discourse on matters of common, everyday experience and, albeit indirectly, to distinguish this area of discourse from what constitutes the knowledge of ultimate reality. Thus Indian epistemology entails an implicit metaphysical concern when it is employed in the context not only of the knowledge of one’s intrinsic nature but also of reality as such.

Knowledge for the Jainas takes place in the soul, which, without the limiting factor of karma, is omniscient. Human beings have partial knowledge - the object of knowledge is known partially and the means of knowledge do not operate to their full capacity. The Jainas have an intricate theory of knowledge concerning the fundamental principles (*tattva*), and the first systematic presentation of it was given by Umāsvāti (see §4) in the first chapter of his *Tattvārthasūtra* (fourth or fifth century). The following is a summary of his theory; the bracketed numbers are the relevant aphorisms. The knowledge of the basic Jaina truths is said to be obtained through means or instruments of knowledge (*pramāṇa*) which can yield a comprehensive knowledge of an object, and through particular standpoints which yield a partial knowledge (*naya*; 6) (see Manifoldness, Jaina theory of). The first type of knowledge is of five kinds: sensory knowledge, scriptural knowledge, clairvoyance, telepathy and omniscience (9-10), among which again the first two are described as being indirect means of knowledge (*parokṣa*), with the

others furnishing direct knowledge (*pratyakṣa*; 11-12), by which it is meant that the object is known directly by the soul (not, for example, as with inferring fire through the cognition of smoke). Jainism is unique in the Indian tradition in regarding sensory perception as an indirect means of knowledge, because it does not take place directly through the soul, although some notable Jaina thinkers (such as Akalaōka and Māṇikyanandin) are exceptions.

Synonyms for sensory knowledge are remembrance, recognition, 'induction' and 'deduction', all caused by the senses and the mind (13-14). Scriptural knowledge, which is based on sensory knowledge, is of two, several or twelve kinds (20), depending on which scriptural works are taken as authoritative. The range of sensory and scriptural knowledge extends to all the six substances (soul and the five non-sentient substances), but not in all their modes (26). Clairvoyance is possessed by divine and infernal beings, and can be obtained by human beings and animals through a destruction and/or subsidence of the karma which hinders it (21-2). Its scope is all entities that have form (27). Telepathy is of two kinds, which are distinguished on the basis of purity and infallibility (23-4). Its scope is infinitely greater than that of clairvoyance (28). The scope of omniscience, on the other hand, extends to all substances in all their modes simultaneously (29). Sensory knowledge, scriptural knowledge and clairvoyance are explicitly referred to as means of knowledge that may also be erroneous (31).

The basic division of knowledge into the direct and indirect types is generally retained by all Jaina thinkers, though with differences in the way in which they are further classified. For example, Akalaōka (*c.* eighth century) regarded sensory knowledge as a direct means of knowledge, and Māṇikyanandin (*c.* ninth century) evolved a much more complex system with several more subvarieties. When a description of inference as a means of knowledge is given, the occasion is used to discuss logical issues in detail. Jaina logic applies the Nyāya language within its own metaphysical presuppositions. Some of the basic features of Indian logic which the Jainas also adopt involve: (1) the use of inference in the accepted standard form, to convince others of the validity of an argument, clearly distinguishing the three basic terms of the major, the middle and the minor; (2) an example or instance, which can also be in a negative form, based on the invariable concomitance of or inseparable connection between the middle term of an argument and all cases in which the major term obtains; and (3) a concern with types of fallacies based not only on pervasion but also on the relation of the different terms with each other and the locus in which they apply (see Inference, Indian theories of).

With his *Nyāyāvatāra (The Descent of Logic)*, Siddhasena Divākara (*c.* fifth century) is perhaps the first Jaina thinker who deals with these and other issues in Jaina logic. A few selected examples will show how Jainism imbibed the logic of the Nyāya school, the structure of which it applied to prove its own arguments and to show errors in the arguments of others. The classical example for an understanding of the abstract ideas expressed here is that of smoke and fire, the basic elements of which, as they feature in a five-step inferential argument, are: (1) the theory - the hill (minor term) possesses fire (major term); (2) the cause or reason - because of smoke (middle term); (3) the example based on invariable concomitance - wherever there is smoke there is fire (as in a kitchen); (4) the application of the theory - similarly the mountain has smoke; and (5) the conclusion - therefore it is the same, that is, has fire.

> A statement expressive of the reason (*i.e.*, the mark or the middle term, called *hetu*) which is inseparably connected with that which is to be proved (*i.e.*, the major term, called *sādhya*) having been composed of the minor term (called *pakṣa*, signifying a side or place), etc., is called an inference for the sake of others (*parārthānumāna*).
>
> (*Nyāyāvatāra*, stanza 13; trans. S.C. Vidyabhusan)

> Where the inseparable connection of the major term (*sādhya*) and the middle term (*sādhana* or *hetu*) is shown by homogeneousness (*sādharmya*), the example is called a homogeneous one, on account of the connection (between those terms) being recollected.
>
> (stanza 18)

> The reason (*i.e.*, the middle term called *hetu*) has been defined as that which cannot exist except in connection with the major term (*sādhya*); the fallacy of the reason (*hetvābhāsa*) arises from nonconception, doubt or misconception about it (the middle term).
>
> (stanza 22)

The Indians did not develop a system for presenting their abstract ideas symbolically; natural language

(pre-eminently Sanskrit), used in such a technical way that only the specialist can decipher the arguments, served the function. However, there have been several successful contemporary attempts to translate Indian logic into the terminology of modern Western logic (Ingalls 1951; Matilal 1968, 1971; Staal 1960).

3 Ethics
